HARPER'S NEW MONTHLY MAGAZINE.

No. CCXXIX.—JUNE, 1869.—VOL. XXXIX.

THE AURORA BOREALIS OR POLAR LIGHT.

By ELIAS LOOMIS, PROFESSOR IN YALE COLLEGE.

FIG. 1.—AURORA BOREALIS SEEN IN NORWAY.

THE POLAR LIGHT is a light which is frequently seen near the horizon, bearing some resemblance to the morning twilight, whence it has received the name of aurora. In the northern hemisphere it is usually termed "aurora borealis," because it is chiefly seen in the north. A similar phenomenon is also seen in the southern hemisphere, where it is called "Aurora Australis." Each of them may, with greater propriety, be called "Aurora Polaris," or *Polar Light*.

Auroras exhibit an endless variety of appearances; but they may generally be referred to one of the following classes:

First.—A light near the horizon, resembling the morning aurora or break of day. The polar light may generally be distinguished from the true dawn by its position in the heavens,

FIG. 2.—AURORAL ARCHES SEEN IN CANADA.

especially in the United States, where it always appears in the northern quarter. This is the most common form of aurora, but it is not an essentially distinct variety, being due to a blending of the other varieties in the distance. The upper boundary of this light is an arc of a small circle, which shades off gradually into the darkness of the nocturnal sky, but is much better defined than the twilight.

Second.—An arch of light somewhat in the form of a rainbow. This arch frequently extends entirely across the heavens, from east to west, and cuts the magnetic meridian nearly at right angles. This arch does not remain for a long time stationary, but changes its elevation above the horizon; and when the aurora exhibits great splendor, several parallel arches are often seen at the same time, appearing as broad belts of light stretching from the eastern to the western horizon. In high northern latitudes five or six such arches have frequently been seen at once; and on two occasions have been seen nine parallel arches, separated by distinct

intervals. Figure 2 represents auroral arches seen a few years since in Canada.

Third.—Slender, luminous beams or columns, well defined, and frequently very brilliant. These beams rise to various heights in the heavens, frequently 20 or 30 degrees, and sometimes ascending as high as the zenith. Their breadth varies from a quarter of a degree up to two or three degrees. Frequently they last but a few minutes; sometimes they continue a quarter of an hour, a half hour, or even a whole hour. Sometimes they remain for several minutes at rest, and sometimes they have a quick lateral motion. Their light is commonly of a pale yellow, sometimes it is reddish, while occasionally it is crimson or even of blood-color. Sometimes the luminous beams are interspersed with dark rays resembling dense smoke. Sometimes the tops of the beams are pointed, and having a waving motion they resemble the lambent flames of half-extinguished alcohol burning upon a broad, flat surface. [See Figures 3, 4, and 5.] Faint stars

FIG. 3.—AURORAL BEAMS OR COLUMNS.

FIG. 4.—AURORAL BEAMS SEEN IN ENGLAND.

are visible through the substance of the auroral beams.

Fourth.—The corona or crown. Luminous beams sometimes shoot up simultaneously from nearly every part of the horizon, and converge to a point a little south of the zenith, forming a quivering canopy of flame. This is called a corona or crown. The sky now resembles a fiery dome, and the crown appears to rest upon variegated fiery pillars, which are frequently

traversed by waves or flashes of light. This may be called a complete aurora, and comprehends most of the peculiarities of the other varieties. [See Figure 13.] The corona seldom remains complete longer than one hour. The streamers then become fewer and less intensely colored, the luminous arches break up, while a dark segment is still visible near the northern horizon, and at last nothing remains but masses of delicate clouds. During the exhibition of

FIG. 5.—AURORAL BEAMS WITH A WAVY MOTION.

FIG. 6.—DARK SEGMENT BENEATH AN AUROREAL ARCH.

brilliant auroras, delicate fibrous clouds are commonly seen floating in the upper regions of the atmosphere; and on the morning after a great nocturnal display we sometimes recognize streaks of cloud similar to those which had been luminous during the preceding night. Sometimes when the sun is above the horizon these clouds arrange themselves in forms similar to the beams of the aurora, constituting what has been called a "day aurora."

Fifth.—Waves or flashes of light. The luminous beams sometimes appear to shake with a tremulous motion; while flashes like waves of light roll up toward the zenith, and sometimes travel along the line of an auroral arch. Sometimes the beams have a slow, lateral motion from east to west, and sometimes from west to east. These sudden flashes of auroral light are known by the name of "Merry Dancers," and form an important feature of nearly every splendid aurora.

The duration of auroras is very variable. Some last only an hour or two; others last all night; and occasionally they appear on two successive nights under circumstances which lead us to believe that, were it not for the light of the sun, an aurora might be seen uninterruptedly for thirty-six or forty-eight hours. For more than a week, commencing August 28, 1859, in the northern part of the United States, the aurora was seen almost uninterruptedly every clear night. In the neighborhood of Hudson Bay the aurora is seen for months almost without intermission.

Auroras are characterized by recurring fits of brilliancy. After a brilliant aurora has faded away and almost entirely disappeared, it is common for it to revive, so as to rival and

often to surpass its first magnificence. Two such alternations are common features of brilliant auroras, and sometimes three or four occur on the same night.

The color of the aurora is very variable. When the aurora is faint its light is usually white or a pale yellow. When the aurora is brilliant, the sky exhibits at the same time a great variety of tints; some portions of the sky are nearly white, but with a tinge of emerald-green; other portions are of a pale yellow or straw-color; others are tinged with a rosy hue; while others may have a crimson hue, which sometimes deepens to a blood-red. These colors are ever varying in their position and in the intensity of their light.

Auroras are sometimes observed simultaneously over large portions of the globe. The aurora of August 28, 1859, was seen throughout more than 140 degrees of longitude, from Eastern Europe to California; and from Jamaica on the south to an unknown distance in British America on the north. The aurora of September 2, 1859, was seen at the Sandwich Islands; it was seen throughout the whole of North America and Europe; and the disturbance of the magnetic needle indicated its presence throughout all Northern Asia, although the sky was overcast, so that at many places it could not be seen. An aurora was seen at the same time in South America and New Holland. The auroras of September 25, 1841, and November 17, 1848, were almost equally extensive.

FIG. 7.—ELLIPTIC FORM OF AUROREAL ARCHES.

FIG. 8.—AUROREAL ARCHES OF AN ELLIPTIC FORM SEEN IN THE ARCTIC REGIONS.

In the United States an aurora is uniformly preceded by a hazy or slaty appearance of the sky, particularly in the neighborhood of the northern horizon. When the auroral display commences, this hazy portion of the sky assumes the form of a dark bank or segment of a circle in the north, rising ordinarily to the height of from five to ten degrees. [See Figure 6.] This dark segment is not a cloud, for the stars are seen through it as through a smoky atmosphere, with little diminution of brilliancy.

This dark bank is simply a dense haze, and it appears darker from the contrast with the luminous arc which rests upon it. In high northern latitudes, when the aurora covers the entire heavens, the whole sky seems filled with a dense haze; and in still higher latitudes, where the aurora is sometimes seen in the south, this dark segment is observed resting on the southern horizon and bordered by the auroral light. This phenomenon was noticed in the United States in the aurora of August, 1859.

FIG. 9.—AURORAL ARCHES OF AN ELLIPTIC FORM SEEN IN SCANDINAVIA.

The highest point of this dark segment generally coincides with the magnetic meridian. Exceptions to this rule do, however, frequently occur, and in some places there is a constant deviation of ten degrees or more.

The dark segment just described is bounded by a luminous arc, whose breadth varies from half a degree to one or two degrees. The lower edge of the arc is well defined; but unless the breadth be very small the upper edge is ill defined, and blends with a general brightness of the sky. If the aurora becomes brilliant, other arcs usually form at greater elevations, some-

times passing through the zenith. The summit of these arcs is situated nearly in the magnetic meridian, and the arc sometimes extends symmetrically on each side toward the horizon. Frequently, however, the summit of the arc deviates ten degrees or more from the magnetic meridian, and in some places this deviation appears to be tolerably constant.

An auroral arch is frequently incomplete, and extends only a portion of the distance from one horizon to the other. The apparent breadth of auroral arches varies with their elevation above the horizon. The result of a large number of

observations gives eight degrees as the average breadth of arches seen at altitudes less than sixty degrees; while for arches whose altitude is greater than sixty degrees the average breadth is twenty-five degrees.

When an arch appears to move across the sky from north to south or the reverse, its angular breadth exhibits corresponding changes. If the distance of an arch from the earth remained constant during its movement of translation, and the arch was of the form of a ring

FIG. 10.—AURORAL CURTAIN IN FOLDS.

FIG. 11.—AURORAL CURTAIN SEEN IN SCANDINAVIA.

whose section was a circle, its breadth when in the zenith should be double what it was when its elevation was 30 degrees. But its observed breadth in the former case is three or four times as great as in the latter, showing that a section of the ring is of an oval form with its greatest diameter parallel to the earth's surface.

Auroral arches do not meet the horizon at points distant 180 degrees from each other. Careful measurements have shown that, except near the horizon, they may be regarded as por-

tions of small circles parallel to the earth's surface. Such a circle seen obliquely would have the appearance of an ellipse. Near the horizon the elliptic form of the auroral arch has sometimes been quite noticeable, the extremities of the arch being bent inward as shown in Figure 7. Occasionally an ellipse has been seen almost entire, and in one instance the ellipse has been seen complete, the axes of the ellipse being in the ratio of two to one.

Sometimes an auroral arch consists of rays

FIG. 12.—AUROREAL ARCHES HAVING A STRIATED APPEARANCE.

FIG. 13.—AURORAL CORONA.

arranged in irregular and sinuous bands of various and variable curvatures, like the undulations of a streamer or flag waving in the breeze. Sometimes the appearance is that of a brilliant curtain whose folds are agitated by the wind. [See Figures 10 and 11.] These folds sometimes become very numerous and complex, and the arch assumes the form of a long sheet of rays returning into itself, the folds enveloping each other, and presenting an immense variety of the most graceful curves.

Auroral arches generally tend to divide into short rays running in the direction of the breadth of the arch, and converging toward the magnetic zenith. They frequently appear to be formed of transverse fibres terminating in a regular curve, which forms the lower edge of the arch. Arches of a uniform nebulous appearance are not the most frequent; striated arches are very common; and auroral arches present every intermediate variety between these two extremes. Sometimes auroral beams arrange themselves in the form of an arch. Sometimes an auroral arch is formed of short streams parallel to each other, presenting the appearance of a row of comets' tails.

An auroral arch does not long maintain a fixed position. It is frequently displaced, and is transported parallel to itself from north to south, or from south to north. Sometimes an arch which is first seen near the northern hori-

zon gradually rises, ascends to the zenith, and descends toward the southern horizon, where it remains for a time nearly stationary, and then perhaps retraces its course. In the United States, as well as in Europe, auroral arches more frequently move from north to south than from south to north. Sometimes there is also a movement of the arch from west to east, or from east to west. The rate of motion of auroral arches is very variable. If we suppose the arch to be elevated 125 miles above the earth, the observed angular motion of translation would indicate an actual velocity of from 1000 to 3000 feet per second.

The motion of auroral beams is sometimes in a lateral direction, and sometimes it is upward or downward. The downward motion is the most common, and sometimes it takes place with very great velocity, and in a large number of beams simultaneously. When an auroral beam rises and falls alternately without much change of length, it is said to *dance*. This is a common occurrence in high northern latitudes, where it is known by the name of the "Merry Dancers."

When the sky is filled with a large number of separate beams all parallel to each other, according to the rules of perspective these beams will seem to converge to one point, as shown in Figures 15 and 16; and if the beams are parallel to the direction of the dipping-nee-

Fig. 16.*Fig. 15.**Fig. 17.*

FIGS. 15, 16, 17.—ILLUSTRATING THE THEORY OF AN AURORAL CORONA.

dle, they will seem to converge to the magnetic zenith. [See Figure 17.] Hence results the appearance of a corona or crown of rays whose centre is less luminous than other portions of the sky. [See Figure 13.]

Sometimes the corona is incomplete, the beams on one side being deficient. When a striated arch passes the magnetic zenith it frequently presents the appearance of an incomplete corona. If the arch advances from north to south, before reaching the magnetic zenith it forms a half crown on the northern side; when it passes the magnetic zenith we have a corona

tolerably complete; and after the arch has passed the magnetic zenith it forms a half crown on the southern side.

When an aurora becomes less active its beams become less luminous, their edges become more diffuse, they diminish in length while they increase in breadth, and assume the appearance of luminous clouds. Sometimes they exhibit a fibrous structure, and present a strong resemblance to those delicate clouds which are often seen in pleasant weather, and are designated by the term "cirrus."

During the exhibition of a brilliant aurora

FIG. 14.—ALTITUDE OF AURORA OF AUGUST 28, 1859.

we frequently notice an appearance of general nebulosity or luminous vapor covering large portions of the heavens, and sometimes almost the entire celestial vault. In the upper part of the sky the light is generally faint, sometimes not exceeding that of the milky-way; but near the horizon the light is sometimes so intense as to resemble a vast conflagration. The great disparity between the light of auroral vapor when near the zenith and near the horizon indicates that the vertical thickness of the auroral vapor is small in comparison with its horizontal dimensions.

The great auroral exhibition of August and September, 1859, was very carefully observed at a large number of stations, and these observations have enabled us to determine the height of the aurora above the earth's surface. At the most southern stations where these auroras were observed, the light rose only a few degrees above the northern horizon; at more northern stations the aurora appeared at a greater elevation; at certain stations it just attained the zenith; at stations further north the aurora covered the entire northern heavens as well as a portion of the southern; and at places still further north nearly the entire visible heavens from the northern to the southern horizon were overspread with the auroral light.

In Figure 14, AB represents a portion of the earth's surface, and beneath are given the names of some of the places where observations were made upon the aurora of August 28, 1859, all at the same hour of the evening. The dotted lines drawn from the five most southern stations (Jamaica to Savannah) represent the elevations of the upper boundary of the auroral light above the northern horizon. The point D thus determined is then the upper edge of the auroral light near its southern margin, and this point is found to be 534 miles above the earth's surface.

The dotted lines from the five most northern stations (Sandy Spring, Maryland, to Lewiston, Maine) show the elevation of the lower limit of the auroral light above the south horizon. The

point C thus determined is the lower edge of the auroral light near its southern margin, and this point is found to be 46 miles above the earth's surface. The line CD represents, therefore, the southern boundary of the auroral illumination.

These results, combined with a vast number of other observations, show that the aurora of August 28, 1859, formed a stratum of light encircling the northern hemisphere, extending southward to latitude 38 degrees in North America, and reaching to an unknown distance on the north; and it pervaded more or less the entire interval between the elevations of 46 miles and 500 miles above the earth's surface. This illumination consisted chiefly of luminous beams or columns every where nearly parallel to the direction of a magnetic needle when freely suspended.

At New York a magnetic needle, freely suspended, points about seven degrees westward of the true north; and if the needle be supported by its centre of gravity, so as to be free to move in a vertical plane, the north pole will incline downward, making an angle of about 17 degrees with a vertical line. Such a needle we call a dipping-needle, and the point nearly overhead toward which one pole of the dipping-needle is directed is called the magnetic zenith. In Southern Florida the dip of the magnetic needle is 55 degrees, and it increases as we proceed northward, being about 73 degrees at New York, and 78 degrees at Quebec.

The luminous beams in the aurora of August, 1859, were sensibly parallel to the direction of the dipping-needle; they were about 500 miles in length, while their diameters varied from 5 to 50 miles, and perhaps sometimes they were still greater.

The height of a large number of auroras has been computed by similar methods, and the average result for the upper limit of the streamers is 450 miles. From a multitude of observations it is concluded that the aurora seldom appears at an elevation less than about 45 miles above the earth's surface, and that it frequently extends upward to an elevation of 500 miles.

Auroral arches having a well-defined border are generally less than 100 miles in height.

Some persons contend that the aurora is occasionally seen at elevations of less than one mile above the earth's surface. It has been claimed that the aurora is sometimes seen between the observer and a cloud; but this appearance is believed to result from a cloud of very small density, thoroughly illumined by auroral light which shines through the cloud, so as to produce the same appearance as if the aurora prevailed on the under side of the cloud.

Sometimes the lower extremity of an auroral streamer appears to be prolonged below the summit of a neighboring mountain or hill. This appearance is probably an illusion. The same phenomenon has been noticed by more cautious observers, who traced the result to the reflection of the auroral light from the snow which covered the mountain. Although it is possible

that the aurora may sometimes descend nearly to the earth's surface, there is no sufficient evidence to prove that the true polar light has ever descended so low as the region of ordinary clouds.

There is no satisfactory evidence that the aurora ever emits any audible sound. It is nevertheless a common impression, at least in high latitudes, that the aurora sometimes emits sound. This sound has been described as a rustling, hissing, crackling noise. But the most competent observers, who have spent several winters in the Arctic regions, where auroras are seen in their greatest brilliancy, have been convinced that this supposed rustling is a mere illusion. It is therefore inferred that the sounds which have been ascribed to the aurora must have been due to other causes, such as the motion of the wind, or the cracking of the snow and ice in consequence of their low temperature.

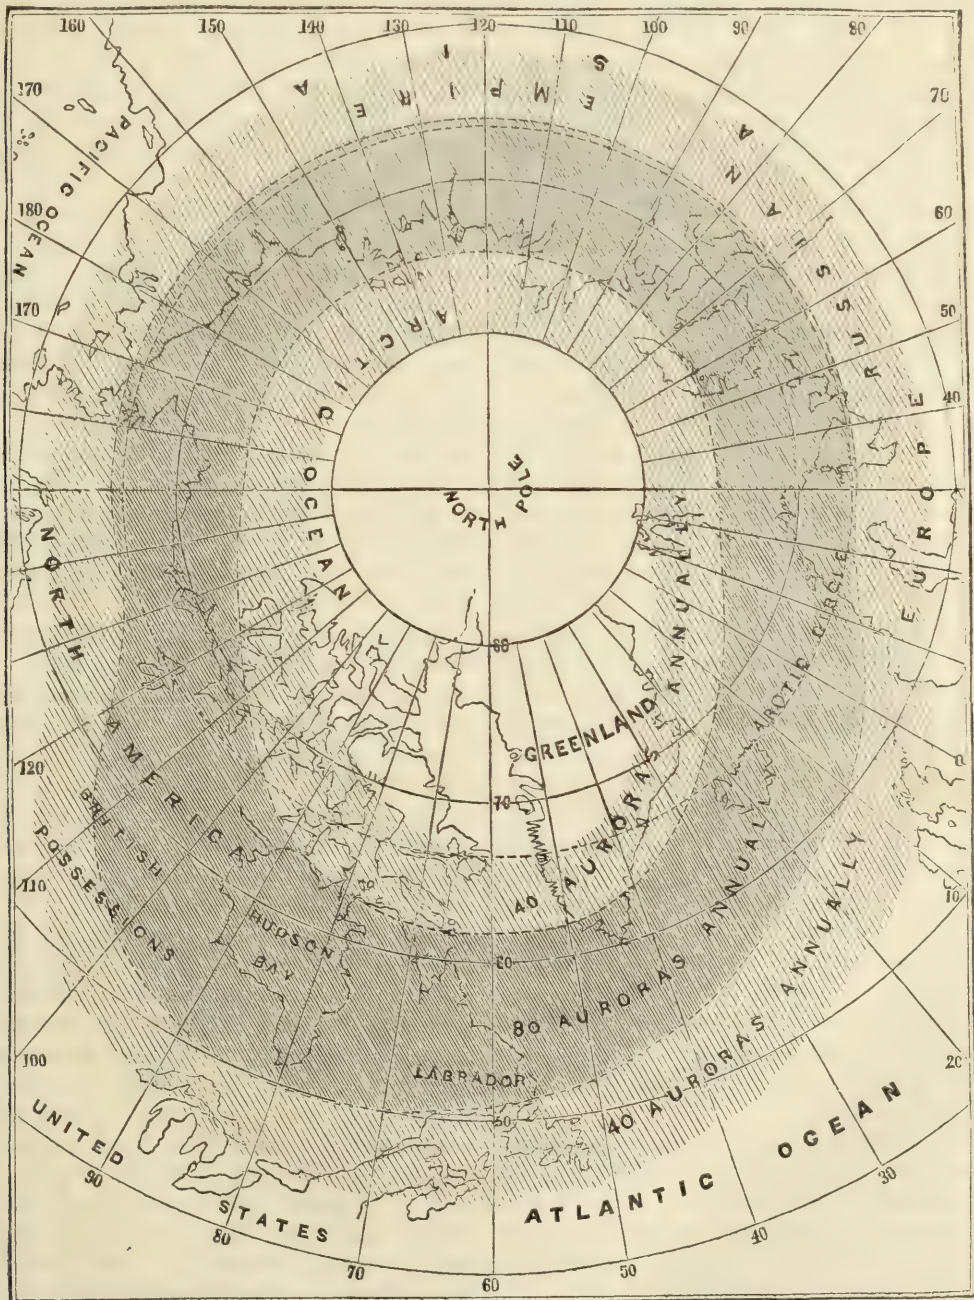

FIG. 18.—GEOGRAPHICAL DISTRIBUTION OF AURORAS.

If the aurora emitted any audible sound this sound ought to follow the auroral movement after a considerable interval. Sound requires four minutes to travel a distance of 50 miles. But the observers who report noises succeeding auroral movements make no mention of any interval. It is therefore inferred that the sounds which have been heard during auroral exhibitions are to be ascribed to other causes than the aurora.

Auroras are very unequally distributed over the earth's surface. They occur most frequently in the higher latitudes, and are almost unknown within the tropics. At Havana, in latitude 23 degrees, but six auroras have been recorded within a hundred years, and south of Havana auroras are still more unfrequent. As we travel northward from Cuba, auroras increase in frequency and brilliancy; they rise higher in the heavens, and oftener ascend to the zenith. Near the parallel of 40 degrees we find on an average only ten auroras annually. Near the parallel of 42 degrees the average number is twenty annually; near 45 degrees the number is forty; and near the parallel of 50 degrees it amounts to eighty annually. Between this point and the parallel of 62 degrees auroras, during the winter, are seen almost every night. They appear high in the heavens, and as often to the south as the north. In regions further north they are seldom seen except in the south, and from this point they diminish in frequency and brilliancy as we advance toward the pole. Beyond latitude 62 degrees the average number of auroras is reduced to forty annually. Beyond latitude 67 degrees it is reduced to twenty; and near latitude 78 degrees it is reduced to ten annually. If we make a like comparison for any European meridian we shall find a similar result, except that the auroral region is situated further northward than it is in America. Upon Figure 18 the dark shade indicates the region where the average number of auroras annually amounts to at least eighty; and the lighter shade indicates the region where the average number of auroras annually amounts to at least forty.

We thus see that the region of greatest auroral abundance is a zone of an oval form surrounding the north pole, and whose central line crosses the meridian of Washington in latitude 56 degrees, and the meridian of St. Petersburg in latitude 71 degrees. Accordingly, auroras are much more frequent in the United States than they are in the same latitudes of Europe. Within this auroral zone is a region 2000 miles in diameter, throughout which it is presumed that auroras are not more common than they are in New England.

Auroras in the southern hemisphere are nearly, if not quite, as frequent as they are in the corresponding magnetic latitudes of the northern hemisphere, and it is probable that the geographical distribution of auroras in the two hemispheres is somewhat similar.

By comparing the records of auroras in the

two hemispheres we find a remarkable coincidence of dates, which seems to justify the conclusion that an unusual auroral display in the southern hemisphere is always accompanied by an unusual display in the northern hemisphere; that is, a great exhibition of auroral light about one magnetic pole of the earth is uniformly attended by a great exhibition of auroral light about the opposite magnetic pole.

The aurora is ordinarily accompanied by a considerable disturbance of the magnetic needle, and the effect increases with the extent and brilliancy of the aurora. Auroral beams cause a disturbance of the needle, particularly when the beams themselves are in active motion. Auroral waves or flashes, especially if they extend as high as the zenith, cause a violent agitation of the needle, consisting of an irregular oscillation on each side of its mean position.

These extraordinary deflections of the needle prevail almost simultaneously over large portions of the globe, even where the aurora itself is not visible. During the great auroral display of September 2, 1859, the disturbances of the magnetic needle were very remarkable throughout North America, Europe, and Northern Asia, as well as in New Holland. At Toronto, in Canada, the declination of the needle changed nearly four degrees in half an hour. The inclination was observed to change nearly three degrees when the needle passed beyond the limits of the graduated scale, so that the entire range of the needle could not be determined. At several observatories in Europe still more remarkable disturbances were recorded. These irregular disturbances of the magnetic needle are not quite simultaneous at distant stations. Over the surface of Europe and also of North America they appear to be propagated from northeast to southwest at the rate of about 100 miles per minute.

Auroras exert a remarkable influence upon the wires of the electric telegraph. During the prevalence of brilliant auroras the telegraph lines generally become unmanageable. The aurora develops electric currents upon the wires, and hence results a motion of the telegraph instruments similar to that which is employed in telegraphing; and since this movement is frequent and irregular, it ordinarily becomes impossible to transmit intelligible signals. During several remarkable auroras, however, the currents of electricity on the telegraph wires have been so steady and powerful that they have been used for telegraph purposes as a substitute for a voltaic battery; that is, messages have been transmitted by telegraph from the auroral influence alone. This result proves that the aurora develops on the telegraph wires an electric current similar to that of a voltaic battery, and differing only in its variable intensity.

Auroras appear at all hours of the night, but not with equal frequency. The average number increases uninterruptedly from sunset till about midnight, from which time the number

diminishes uninterruptedly till morning. In Canada the maximum occurs an hour before midnight; further north, in latitude 52 degrees, the maximum occurs at midnight; and still further north, to the Arctic Ocean, the maximum occurs an hour after midnight.

Auroras occur in each month of the year, but not with equal frequency. In New England and New York the least number of auroras is recorded in winter, and the greatest number in the autumn. It is difficult to make an entirely satisfactory comparison on account of the unequal length of the days in the different seasons of the year; but apparently the maximum occurs in September, and the minimum in December or January. The number of auroras seen in different years is extremely variable. Sometimes, for several years, auroras are remarkable for their number and magnificence, and then there succeeds a barren interval during which auroras are almost entirely forgotten.

If we compare the observations made at any one station for a long period of years, we shall discover that the inequality in the number of auroras upon successive years recurs periodically. In order to discover the law which governs auroral displays, it is important to have observations made at the same station upon a uniform plan continued for a long period of time. A tolerably complete auroral record has been kept at New Haven for nearly one hundred years, and a similar record has been kept in the neighborhood of Boston since 1742. Similar records have been preserved at many places in Europe, extending back for a period of two centuries. In order to neutralize as far as possible the imperfections of any single record, I have taken the average of three different records, viz.: those at New Haven and Boston, representing New England, and that at St. Petersburg, representing the north of Europe. Instead of exhibiting these results in a tabular form I have represented them by a curve line in Figure 19. The years are indicated both at the top and bottom of the figure, and from the base line AB for each year a perpendicular is drawn whose length is proportional to the number of auroras recorded for that year, the number of auroras being indicated on the left of the figure. Through the points thus determined a curve line is drawn, and this curve represents the relative number of auroras in New England and Northern Europe for a period of 130 years. This curve clearly indicates a period of unusual auroral abundance from 1770 to 1790. Then followed a period of great barrenness from 1792 to 1826; and then succeeded another period of unusual abundance from 1836 to 1864. We also notice subordinate fluctuations which generally succeed each other at intervals of about eleven years. Thus auroras were uncommonly abundant in the years 1773, 1781, 1787, 1840, 1848, and 1860, while during the barren period from 1790 to 1826 a slight increase will be remarked in the years 1804 and

1819, with a more decided increase in 1830. Most of these peculiarities are noticeable in the observations at each of the stations employed in this comparison, and the principal of them are clearly marked in the observations at every station where an auroral record has been long continued. These inequalities in the observed frequency of auroras are not accidental, nor are they local peculiarities, but they are characteristic of the northern hemisphere of our globe. It is then considered as established that periods of unusual auroral abundance succeed each other at intervals of from eight to sixteen years, the average interval being somewhat over eleven years. Moreover, these successive maxima are very unequal in intensity, showing generally a grand maximum at the end of five of the shorter periods; that is, at intervals of 55 or 56 years. These conclusions are confirmed by the records of auroral displays extending back a century earlier than is shown in Figure 19. The grand result, then, which we have deduced from the observations is, that auroras recur in unusual numbers every eleven years, and there is a maximum of unusual splendor every fifty-five years. During the last few years auroras have been less numerous than usual, but a considerable increase of splendor may be anticipated about 1870.

THEORY OF THE POLAR LIGHT.

Some have ascribed the polar light to a rare nebulous matter occupying the interplanetary spaces, and revolving round the sun at such a distance that a portion of this matter occasionally falls into the upper regions of the atmosphere with a velocity sufficient to render it luminous from the condensation of the air before it. Upon this hypothesis the aurora would not differ essentially from a grand exhibition of shooting-stars, unless, perhaps, in the density of the substance which occasions the phenomenon. But this hypothesis will not explain why auroras are always confined to certain districts of the earth, and are wholly unknown in other portions. We reject this hypothesis, therefore, as irreconcilable with the known geographical distribution of auroras.

Auroral exhibitions take place in the upper regions of the atmosphere, since they partake of the earth's rotation. All the celestial bodies have an apparent motion from east to west, arising from the rotation of the earth; but bodies belonging to the earth, including the atmosphere and the clouds which float in it, partake of the earth's rotation, so that their relative position is not affected by it. The same is true of auroral exhibitions. Whenever an auroral corona is formed, it maintains sensibly the same position in the heavens during the whole period of its continuance, although the stars meanwhile revolve at the rate of 15 degrees per hour.

The grosser part of the earth's atmosphere is limited to a moderate distance from the earth. At the height of a little over four miles, the density of the air is only one-half what it is at

FIG. 19.—SHOWING THE RELATIVE NUMBER OF AURORAS OBSERVED EACH YEAR SINCE 1740; ALSO THE RELATIVE EXTENT OF THE BLACK SPOTS SEEN ON THE SURFACE OF THE SUN; AND THE MEAN DAILY VARIATION OF THE MAGNETIC NEEDLE IN EUROPE.

the earth's surface. At the height of 50 miles the atmosphere is well-nigh inappreciable in its effect upon twilight. The phenomena of lunar eclipses indicate an appreciable atmosphere at the height of 66 miles. The phenomena of shooting-stars indicate an atmosphere at the height of 200 or 300 miles, while the aurora indicates that the atmosphere does not entirely cease at the height of 500 miles. Auroral exhibitions take place, therefore, in an atmosphere of extreme rarity; so rare indeed that if, in experiments with an air-pump, we could exhaust the air as completely, we should say that we had obtained a perfect vacuum.

The auroral light is electric light. Our first reason for believing in this identity is derived from the appearance of the auroral light. The colors of the aurora are the same as those of ordinary electricity passed through rarefied air. When a spark is drawn from an ordinary electrical machine in air of the usual density, the light is intense and nearly white. If the electricity be passed through a glass vessel in which the air has been partially rarefied, the light is more diffuse, and inclines to a delicate rosy hue. If the air be still further rarefied, the light becomes very diffuse, and its color becomes a deep rose or purple. The same variety of colors is observed during auroral exhibitions. The transition from a white or pale straw-color to a rosy hue, and finally to a deep red, probably depends upon the height above the earth, and upon the amount of condensed vapor present in the air.

The emerald-green light which is seen in some auroras is ascribed to the projection of the yellow light of the aurora upon the blue sky, since green may be formed by a combination of yellow and blue light. A similar effect is often produced in the evening twilight by a combination of the yellow light of the sun with the blue of the celestial vault.

The light of electricity possesses certain properties which distinguish it from solar light. There are certain substances which, in ordinary solar light, appear almost entirely transparent, like pure water, but which, when illumined by an electric spark in a dark room, present a very peculiar appearance, as if they were self-luminous. This appearance is termed fluorescence. When such substances are illumined by auroral light, they exhibit the same peculiarity as when illumined by the spark of an ordinary electrical machine.

These considerations must be admitted to create a strong probability that auroral light is identical with electric light. This probability becomes a certainty when we study the effect of an aurora upon the telegraph wires. The electric telegraph is worked by a current of electricity generated by a voltaic battery, and flowing along the conducting wire which unites the distant stations. This current, flowing round an electro-magnet, renders it temporarily magnetic, so that its armature is attracted, and a mark is made upon a roll of paper.

During a thunder-storm the electricity of the atmosphere affects the conducting wire in a similar manner, and a great auroral display produces a like effect. During the auroras of August and September, 1859, there were remarked all those classes of effects which are considered as characteristic of electricity. We will enumerate the most remarkable of these effects:

(1.) In passing from one conductor to another, electricity exhibits a *spark* of light. This light is not like that of a burning coal or a heated iron, but a bright spark, without appreciable duration, which is renewed whenever the electricity passes. During the auroras of 1859, at numerous stations both in America and Europe, similar sparks were drawn from the telegraph wires when no battery was attached.

(2.) In passing through poor conductors electricity develops *heat*. In like manner, during the auroras of 1859, both in America and Europe, paper, and even wood, were set on fire by the auroral influence alone.

(3.) When passed through the animal system, electricity communicates a well-known characteristic *shock*. This electric shock is unlike any effect which can be produced upon the nervous system by any other known method. During the auroras of 1859 several telegraph operators received similar shocks when they touched the telegraph wires.

(4.) A current of electricity decomposes compound substances, resolving them into their elements. Most of the objects with which we are familiar in daily life are compound; that is, are formed by the union of two or more elementary substances. The current of an ordinary voltaic battery affords one of the most efficient means of resolving compound bodies into their elements. The aurora of 1859 was found to produce similar decompositions. One method of transmitting telegraph signals, which has been successfully practiced, is known by the name of the electro-chemical, in which a mark is made upon chemically prepared paper, this mark resulting from the decomposition of the substance with which the paper is impregnated. This substance is decomposed by the passage of an electric current, and the change of color of the paper is the visible proof of the decomposition. The aurora of 1859 produced the same marks upon chemical paper as are produced by an ordinary voltaic battery.

(5.) A current of electricity develops *magnetism* in soft iron. The auroras of 1859 developed magnetism in a similar manner, and they developed it in such abundance that it was more than sufficient for the ordinary business of telegraphing.

(6.) A current of electricity deflects a magnetic needle from its ordinary position of rest. In England the usual telegraph signal is made by a magnetic needle, surrounded by a coil of copper wire, so that the needle is deflected by an electric current flowing through the wire. Similar deflections were caused by the auroras

of 1859, and these deflections were greater than those produced by the telegraph batteries.

These facts clearly demonstrate that the fluid developed by the aurora on telegraph wires is indeed electricity. This electricity may be supposed to be derived from the aurora, either by direct transfer from the air to the wires, or may be induced upon the wires by the action of the auroral fluid at a distance. If we adopt the former supposition, then the light is certainly electric light. If we adopt the latter supposition, then, since we know of but two agents, magnetism and electricity, capable of inducing electricity in a distant conductor, and since magnetism is not luminous, we seem compelled to admit that the auroral light is electric light.

The formation of an auroral corona near the magnetic zenith is the effect of perspective resulting from a great number of luminous beams all parallel to each other. A large collection of vertical beams, as shown in Figure 15, would exhibit the appearance of a great number of beams diverging from a point directly overhead, as shown in Figure 16; and a large collection of inclined beams, all parallel to each other, would produce a similar appearance, except that the point of divergence would not be in the zenith, but in that part of the sky toward which the beams were directed. Now the auroral beams are all parallel to the direction of a magnetic needle freely suspended by its centre of gravity; and they all appear to diverge from that point of the sky toward which the pole of the dipping-needle is directed. The auroral corona or crown appears, therefore, always in the magnetic zenith; and it is not the same crown which is seen at different places any more than it is the same rainbow which is seen by different observers.

The auroral beams are simply spaces which are illumined by the flow of electricity through the upper regions of the atmosphere. During the auroras of 1859 these beams were nearly 500 miles in length, and their lower extremities were elevated about 45 miles above the earth's surface. Their tops inclined toward the south, about 17 degrees in the neighborhood of New York, this being the position which the dipping-needle there assumes.

It was formerly supposed that the electric current necessarily moved in the direction of the axis of the auroral beams; that is, that the electric discharge was from the upper regions of the atmosphere to the earth, or the reverse. Recent discoveries have suggested the possibility of a different explanation. When a stream of electricity flows through a vessel from which the air is almost wholly exhausted, under certain circumstances the light becomes stratified, exhibiting alternately bright and dark bands crossing the electric current at right angles, from which it might be inferred that electricity flowing horizontally through the upper regions of the atmosphere might exhibit alternately bright and dark bands like the auroral beams. But this stratification of the electric light is

generally ascribed to rapid intermittences in the intensity of the electric discharge, and it is not probable that such intermittences can take place in nature with sufficient rapidity to produce a similar effect. It seems, therefore, more probable that auroral beams are the result of a current of electricity traveling in the direction of the axis of the beams.

The slaty appearance of the sky, which is a common feature of great auroral exhibitions, arises from the condensation of the vapor of the air, and this condensed vapor probably exists in the form of minute spiculæ of ice or flakes of snow. Fine flakes of snow have been repeatedly observed to fall during the exhibition of auroras, and this snow only slightly impairs the transparency of the atmosphere without presenting the appearance of clouds. It produces a turbid appearance of the atmosphere, and causes that dark bank which in the United States rests on the northern horizon. This turbidness is more noticeable near the horizon than it is at great elevations, because near the horizon the line of vision traverses a greater extent of this hazy atmosphere. When the aurora covers the whole heavens the entire atmosphere is filled with this haze, and a dark segment may be observed resting on the southern horizon.

Philosophers are by no means agreed as to the origin of atmospheric electricity. It has been ascribed successively to friction, combustion, and vegetation, but these causes seem entirely inadequate to account for the enormous quantities of electricity sometimes present in the atmosphere.

Evaporation is probably the principal source of atmospheric electricity. The vapor which rises from the ocean in all latitudes, but most abundantly in the equatorial regions of the earth, carries into the upper regions of the atmosphere a considerable quantity of positive electricity, while the negative electricity remains in the earth. This positive electricity, after rising nearly vertically with the ascending currents of the atmosphere, would be conveyed toward either pole by the upper currents of the atmosphere.

The earth and the rarefied air of the upper atmosphere may be regarded as forming the two conducting plates of a condenser, which are separated by an insulating stratum, viz., the lower portion of the atmosphere. The two opposite electricities must then be condensed by their mutual influence, especially in the polar regions, where they approach nearest together; and whenever their tension reaches a certain limit there will be discharges from one conductor to the other. When the air is humid it becomes a partial conductor, and conveys a portion of the electricity of the atmosphere to the earth. On account of the low conducting power of the air, the neutralization of the opposite electricities would not be effected instantaneously, but by successive discharges more or less continuous and variable in intensity. These discharges should frequently occur simultane-

ously at the two poles, since the electric tension of the earth should be nearly the same at each pole.

FIG. 20.—CIRCULATION OF ELECTRICITY ABOUT THE EARTH.

Figure 20 represents the system of circulation here supposed; the north and south poles of the earth being denoted by the letters N and S, the direction of the currents being indicated by the direction of the arrows.

When electricity from the upper regions of the atmosphere discharges itself to the earth through an imperfectly conducting medium, the flow can not be every where uniform, but must take place chiefly along certain lines where the resistance is least; and this current must develop light, forming thus an auroral beam. It might be expected that these beams would have a vertical position, but their position is controlled by the earth's magnetism. The earth is a magnet of vast dimensions, but feeble intensity. It is found that when magnetic forces act upon a perfectly flexible conductor, through which an electric current is passing, the conductor must assume the form of a magnetic curve. Now at each point of the earth's surface the dipping-needle shows the direction of the magnetic curve passing through that point. Hence the axis of an auroral streamer must lie in the magnetic curve which passes through its base; and since adjacent streamers are sensibly parallel the beams appear to converge toward the magnetic zenith.

Auroral arches assume a position at right angles to the magnetic meridian in consequence of the influence of the earth's magnetism. Auroral arches generally consist of a collection of short auroral beams all nearly parallel to each other. These beams tend to arrange themselves upon a curve which is perpendicular to the magnetic meridian, forming thus a ring about the magnetic pole. The same law has been discovered to hold true for a stream of electricity under the influence of an artificial magnet. When electricity escapes from a metallic conductor under a receiver from which the air has been exhausted, and this conductor is the pole of a powerful magnet, the electric light forms a complete luminous ring around this conductor.

In like manner the auroral arch is a part of a luminous ring, nearly parallel to the earth's surface, having the magnetic pole for its centre, and cutting all the magnetic meridians at right angles; and this position results from the influence of the earth's magnetism.

The flashes of light observed in great auroral displays are due to inequalities in the motion of the electric currents. On account of the imperfect conducting power of the air, the flow of electricity is not perfectly uniform, but escapes by paroxysms. The flashes of the aurora are therefore feeble flashes of lightning.

The disturbance of the magnetic needle during auroras is due to currents of electricity flowing through the atmosphere or through the earth. A magnetic needle is deflected from its mean position by an electric current flowing near it through a good conductor like a copper wire. A stream of electricity flowing through the earth or the atmosphere must produce a similar effect.

It is probable that the directive power of the magnetic needle is due to electric currents circulating around the globe from east to west. Such currents would cause the magnetic needle every where to assume a position corresponding with what is actually observed; and the existence of such currents has been proved by direct observation.

According to the theory already explained, positive electricity circulates from the equator toward either pole through the upper regions of the atmosphere, and thence through the earth toward the equator, to restore the equilibrium which is continually disturbed by evaporation from the waters of the equatorial seas. This current from the polar regions must modify the regular current which is supposed to be constantly circulating from east to west, resulting in a current from northeast to southwest, in conformity with observations. This current does not, however, flow uninterruptedly from northeast to southwest, but alternates at short intervals with a current in the contrary direction. Such currents of electricity must produce a continual disturbance of the magnetic needle, and they seem sufficient to account for the disturbances actually observed.

The effect of the aurora upon the telegraph wires is similar to that of electricity in thunderstorms, except in the intensity and steadiness of its action. During thunderstorms the electricity of the wires is discharged instantly with a flash of lightning, while during auroras there is sometimes a strong and steady flow of electricity continuing for some minutes.

The geographical distribution of auroras depends chiefly upon the relative intensity of the earth's magnetism in different latitudes. According to experiments with artificial magnets, the electric light tends to form a ring around the pole, and at some distance from it. The electric light should, therefore, be most noticeable in the neighborhood of the earth's magnetic pole, but not directly over it. Auroras

are accordingly most abundant along a certain zone which follows nearly a magnetic parallel, being every where nearly at right angles to the magnetic meridian of the place.

The electricity of the lower regions of the atmosphere within the tropics has great intensity, and moves with explosive violence in thunder-showers; and these exhibitions of electricity do not appear to be controlled by the earth's magnetism. But the electricity of the upper regions of the atmosphere is mainly controlled by the magnetic forces of the earth, and hence, in conformity with what we have observed in our experiments with artificial magnets, exhibitions of auroral light are almost entirely unknown in the equatorial regions of the earth.

The diurnal inequality in the frequency of auroras is probably due to the same causes as the diurnal variation in the intensity of atmospheric electricity. The intensity of atmospheric electricity varies with the hour of the day, being least about four o'clock in the morning, and greatest about ten o'clock in the evening. This variation is to be ascribed partly to real changes in the amount of electricity present in the air, and partly to variations in the conducting power of the air. Auroral displays are most frequent about midnight, probably because, on account of the increasing moisture of the air, the electricity accumulated in the upper regions of the atmosphere is most readily transmitted to the earth; and auroral displays become less frequent in the latter part of the night, because this accumulated electricity becomes partially exhausted by the steady discharge to the earth.

Similar considerations will explain in some measure the unequal frequency of auroras in the different months of the year; but it seems pretty well established that this inequality is partly due to the influence of extra-terrestrial forces, as explained in the following paragraphs:

The secular inequality in the frequency of auroras seems clearly to indicate the influence of distant celestial bodies upon the electricity of our globe. This is inferred from the fact that the periods of auroras observe laws which are similar to those of two other phenomena, viz., the mean diurnal variation of the magnetic needle, and the frequency of black spots upon the sun's surface.

The magnetic needle has a small diurnal variation, the north end moving a little to the east in the morning, and toward the west about the middle of the day. The mean daily change of the magnetic needle not only varies with the locality, but also varies from one year to another at the same locality, and these variations exhibit decided evidence of periodicity. In order to exhibit this fact readily to the eye I have drawn upon Figure 19 a curve line which represents these variations in Central Europe during a period of nearly a century. The curve is constructed in a manner similar to that representing the frequency of auroras, and which has been already described. The years

are indicated at the top and bottom of the figure, and for each year is drawn a vertical line whose length is proportioned to the mean daily change of the magnetic needle for that year. A curve line is then drawn passing through the several points thus determined. The range of the magnetic needle is indicated by the scale on the left margin of the page; and it is seen that in 1829 the mean daily change of the magnetic needle was about fourteen minutes, while in 1834 it was less than eight minutes. Again, in 1838, it attained another maximum, and in 1844 another minimum, and so on. The undulations of this curve bear a remarkable resemblance to the curve representing the frequency of auroras. The maxima and the minima of the two phenomena generally occur on the same years, and always nearly at the same date. We can not doubt, then, that one of these phenomena is dependent upon the other, or both are dependent upon a common cause.

The frequency and the extent of black spots upon the sun's surface exhibit a similar periodicity. Some years the sun's disc is never seen entirely free from spots, while in other years, for weeks and even months together, no spots of any kind can be perceived. On Figure 19 is drawn a curve line representing the relative number of spots seen on the sun's surface in different years from 1740 to the present time. It will be perceived that the times of maximum and minimum of the solar spots correspond almost exactly with the times of maximum and minimum of the magnetic variation, and both agree in a remarkable manner with the times of maximum and minimum frequency of auroral displays. We must therefore conclude that these three phenomena—the solar spots, the mean daily range of the magnetic needle, and the frequency of auroras—are somehow dependent the one upon the other, or all are dependent upon a common cause.

The interval from one maximum of the solar spots to another maximum is somewhat variable; but its average value deduced from observations of more than a century is $11\frac{1}{2}$ years. Now what cause can be supposed to operate upon the sun to produce a grand display of black spots every $11\frac{1}{2}$ years? Jupiter makes one revolution about the sun in $11\frac{1}{4}$ years; and there is no other known celestial body having about the same period which could be supposed to exert an influence upon this phenomenon. In what way Jupiter should be capable of disturbing the surface of the sun we do not know, but if this disturbance results from the action of any of the planets, Jupiter is the one to be first suspected on account of his enormous mass. It must, however, be admitted that the period of Jupiter is a little longer than the average period of the solar spots; whereas, if Jupiter is the cause of these changes, we should expect that the two periods would be identical. It is possible, however, that this small difference may result from a change in the condition of the sun analogous to a change

which has been observed in the magnetism of the earth. The earth has the properties of a vast magnet of feeble intensity, and the position of its magnetic poles changes from century to century. In 1576 the magnetic needle at London pointed 11 degrees east of north; in 1660 it pointed exactly north, and in 1800 it pointed $24\frac{1}{2}$ degrees west of north, since which time the needle has been slowly returning to the north. These observations indicate a movement in the magnetic poles of the earth, extending through a period of several centuries.

There are many facts which seem to indicate that the sun is endowed with a magnetic force similar to the earth; and if the sun is really a great magnet, the analogy of our earth would lead us to admit that the position of the poles of this magnet may be subject to a gradual change. Such a supposition would enable us to explain the small difference between the period of Jupiter and that of the solar spots.

If Jupiter exerts so palpable an influence upon the sun's luminous envelope, then we should anticipate a sensible influence from several of the other planets. If the influence of the different planets upon the sun is supposed to follow the generally received law of gravitation, then if we represent the effect of Jupiter upon the sun by 100, that of Venus will be represented by 14, that of Saturn by 9, that of the earth by 8, that of Mercury by 4, and that of Mars, Uranus, and Neptune by less than unity. We are thus naturally led to inquire whether Venus exerts a sensible influence upon the solar spots. The periodic time of Venus is $7\frac{1}{2}$ months, and a careful measurement of the area of the solar spots has shown that the amount of spotted surface upon the sun is subject to a small inequality having a period of $7\frac{1}{2}$ months; and the amount of this inequality is about one-tenth of that ascribed to Jupiter, which is a near approach to the ratio above computed. We find also that the amount of spotted surface upon the sun is subject to a small inequality having a period of 12 months, and this inequality (as deduced from several years' observations) is more than one-tenth of that ascribed to Jupiter, which somewhat exceeds the influence above computed for the earth. The effect of Saturn is apparent in modifying the action of Jupiter. Two revolutions of Saturn are very nearly equal to five of Jupiter; so that after five revolutions of Jupiter (making a period of somewhat less than 60 years) the two planets return again to nearly the same relative positions. This gives rise to large disturbances of the sun's surface at intervals of nearly 60 years, and to smaller disturbances during the intermediate period.

Not only are the solar spots most numerous and extensive upon those years in which great auroral displays are most common, but the most remarkable auroral displays have usually been attended by an unusual and nearly simultaneous exhibition of solar spots, as if the aurora were the immediate effect of the spotted condition of the sun. If we select the most re-

markable auroras of the present century, and compare the condition of the sun's surface during a few days preceding and a few days following the aurora, we shall find that the solar spots were more extensive before than after these auroral displays, and that the spots were most remarkable two or three days before the aurora. The great auroral display of August 28, 1859, was specially remarkable on this account, the solar spots during the week preceding the aurora having been more extensive than they had been for many previous years. Rapid changes were seen to take place in the appearance of these spots, and two observers, independently of each other, noticed patches of intensely bright light to move across a large spot at the very moment when the magnetic disturbance commenced at Greenwich; and a few hours afterward there succeeded one of the most remarkable magnetic storms, which was felt simultaneously over the entire northern and southern hemispheres.

Moreover, if we select all those days in which a very unusual disturbance of the magnetic needle was recorded at the magnetic observatory of Greenwich, and note the condition of the sun's surface for a few of the preceding and following days, we shall find that the solar spots were generally more extensive before than after these magnetic disturbances; and the greatest exhibition of solar spots preceded by one or two days the unusual disturbances of the magnetic needle. These facts will scarcely permit us to doubt that an unusually disturbed condition of the sun's surface is one of the causes (if not the principal cause) of magnetic disturbances and also of great auroral displays upon the earth.

We seem then naturally conducted to the following hypothesis: not only the earth but each of the planets and also the sun is endowed with a magnetic force, having poles which at each instant occupy a determinate position; but this position is subject to a slow change from year to year. As these magnetic bodies advance in their orbits, each body disturbs the magnetism of every other body in the solar system. The disturbance of the sun's magnetism gives rise to commotions in its luminous envelope, causing openings of variable extent, and these disturbances follow periods corresponding to the times of revolution of the disturbing bodies. Jupiter is the great disturber, and accordingly the solar spots exhibit alternately maxima and minima at intervals corresponding to the time of one revolution of Jupiter. Saturn exerts a small but nevertheless appreciable influence, resulting in unusually large disturbances of the sun's envelope at intervals of five revolutions of Jupiter. Venus and the earth also produce small disturbances of the sun's envelope, causing small undulations in the curve which represents the amount of spotted surface of the sun. The hypothesis thus stated enables us to explain with tolerable precision the principal fluctuations in the sun's luminous envelope during the last 150 years.

These disturbances of the sun's surface are accompanied by disturbances in the electrical condition of the earth. The phenomena might perhaps be best explained by supposing a flow of electricity from the sun to the earth, and that this flow is proportioned to the extent of the disturbance of the sun's surface as indicated by the prevalence of dark spots. If such an hypothesis should be thought inadmissible, then it seems necessary to suppose that during these periods of unusual solar disturbance the sun's magnetism acts with unusual efficiency upon the earth, decomposing its natural electricities, causing an accumulation of positive electricity about one magnetic pole and negative electricity about the opposite magnetic pole. This would lead to grand auroral displays recurring at intervals corresponding with the periods of the solar spots.

By the daily rotation of the earth the position of the great solar magnet with reference to a magnetic needle upon the earth, is continually changing, and this causes a daily oscillation in the position of our magnetic needle. An unusual disturbance of the electricity of the earth causes corresponding disturbances in the position of the magnetic needle, and thus the mean daily range of the magnetic needle exhibits fluctuations whose periods correspond to those of the solar spots.

It will thus be seen that our hypothesis connects together in a simple manner three different phenomena, which apparently are quite unlike, and enables us to render a satisfactory account of their principal peculiarities. If this hypothesis is correct in its essential features, then we can no longer regard auroral displays as exclusively atmospheric phenomena, but they are to a great extent the result of the influence of celestial forces, while their movements are controlled by the magnetic power of the earth. We should then naturally expect that opposite electricities would be driven toward the opposite magnetic poles of the earth, and that the system of circulation of electric currents would be, not such as is exhibited in Figure 20, but such as is shown in Figure 21, where N and S are supposed to represent the north and south magnetic poles of the earth, *n* and *s* the poles of an imaginary magnet representing the magnetism of the earth. The east and west bands represent auroral arches, upon which stand auroral streamers. The dotted lines represent magnetic curves passing from auroral streamers in the southern hemisphere to streamers in the northern hemisphere, showing the path pursued by the currents of electricity in passing from one hemisphere to the other above the atmosphere. This is understood to be the system of circulation advocated by Mr. B. V. Marsh of Philadelphia. It agrees substantially with that represented by Figure 20, so far as the phenomena can be observed in the northern hemisphere; but they lead to different results in the southern hemisphere. We have not the requisite observations from the southern hemisphere to enable

FIG. 21.—CIRCULATION OF ELECTRICITY ABOUT THE EARTH.

us to decide between these two hypotheses. Such observations might easily be made upon the telegraph wires of Australia; and if during some future auroral display such observations could be obtained, they would furnish a true *experimentum crucis* to decide between the two hypotheses.

The hypothesis which has now been stated readily explains the simultaneous displays of great auroras in both hemispheres. We can not explain the great auroral displays in the northern hemisphere by supposing that the electricity of the atmosphere is temporarily diverted from one hemisphere to the other, for the mean daily range of the magnetic needle exhibits its maxima simultaneously in both hemispheres; neither can we suppose that the absolute amount of electricity for the entire globe, as developed by evaporation from the water of the ocean, should undergo great periodical variations, for the mean temperature of the earth's surface does not change sensibly from one year to another. But if these great auroral displays result from the direct action of the sun, through the agency of its magnetism, such an effect should take place simultaneously in both hemispheres, conformably with the results of observation.

It is not claimed that the hypothesis which has here been proposed to explain the inequalities in the frequency and brilliancy of auroras is to be regarded as fully established. Fur-

ther researches and discoveries may require us to modify it in some important particulars, or even to abandon it altogether. Such an hypothesis, however, is not without its value, since it enables us to classify the known facts, and even to predict results which have not hitherto attracted the attention of observers. The true philosopher will not undervalue hypotheses, which have often proved of great value in the promotion of science, but he should be ready to abandon any hypothesis as soon as the progress of science shows it to be no longer tenable.

TOO LATE.

"Ah! si la jeunesse savait—si la vieillesse pouvait!"

THERE sat an old man on a rock
 And unceasing bewailed him of Fate—
 That concern where we all must take stock
 Though our vote has no hearing nor weight;
 And the old man sang him an old, old song—
 Never sang voice so clear and strong
 That it could drown the old man's long,
 For he sang the song "Too late! Too late!"

"When we want, we have for our pains
 The promise that if we but wait
 Till the want has burned out of our brains
 Every means shall be present to sate;
 While we send for the napkin the soup gets cold,
 While the bonnet is trimming the face grows old,
 When we've matched our buttons the pattern is sold,
 And every thing comes too late—too late!"

"When strawberries seemed like red heavens—
 Terrapin stew a wild dream—
 When my brain was at sixes and sevens
 If my mother had 'folks' and ice-cream,
 Then I gazed with a lickerish hunger
 At the restaurant man and fruit-monger—
 But oh! how I wished I were younger
 When the goodies all came in a stream—in a stream!"

"I've a splendid blood horse, and a liver
 That it jars into torture to trot;
 My row-boat's the gem of the river—
 Gout makes every knuckle a knot!
 I can buy boundless credits on Paris and Rome,
 But no palate for *ménus*—no eyes for a dome—
 Those belonged to the youth who must tarry at home
 When no home but an attic he'd got—he'd got."

"How I longed in that lonest of garrets,
 Where the tiles baked my brains all July,
 For ground to grow two pecks of carrots,
 Two pigs of my own in a sty,
 A rose-bush—a little thatched cottage—
 Two spoons—love—a basin of pottage:
 Now in freestone I sit—and my dotage—
 With a woman's chair empty close by—close by!"

"Ah! now, though I sit on a rock,
 I have shared one seat with the Great;
 I have sat, knowing naught of the clock,
 On Love's high throne of state;
 But the lips that kissed and the arms that caressed
 To a mouth grown stern with delay were pressed,
 And circled a breast that their clasp had blessed
 Had they only not come too late! too late!"

WINTER ON THE PLAINS.

OUR FRIENDS THE COYOTES.

A CAMP or bivouac on the Plains can have no better safeguard during the dark hours of night than that which is furnished unasked by the coyotes and gray wolves, that usually put in an appearance just as the second or reflected sunset tinge is fading from the higher clouds. During the winter season night falls so quickly on the Plains that the twilight hour is a thing of name rather than fact. The last of sunset is the commencement of night. At this hour you may hear far in the distance the quick bark of a single coyote. A moment after the yelping of a number of wolves answers this first call. The pack is assembling rapidly, and by the time darkness has shut out your view of the nearer surroundings you will listen to a howling-match—a sort of preliminary trial of voice, which invariably denotes the surrounding of your camp by the new-comers. This howl is short, and seems to be executed by a chosen few. A silence of a few moments' duration follows. Then the whole band breaks out, and the unearthly noise which greets your ear is second to nothing in all the long catalogue of noises. Kit Carson averred that it was “only a little dispute as to which coyote had, as the winner of the match, the right to take the stakes (steaks).” It is quite impossible to do full justice to this wolf music. There is no racket known to the inhabitants of the more civilized sections of our country which will compare with it. All the felines in a neighborhood would not make a

noise which would begin to equal wolf music. The hubbub to be heard at a session of the Board of Brokers is a faint comparison.

Hideous as this wolf concert would seem to ears unused to it, there is no more satisfactory lullaby to the habitual roamer over the Plains, for in the language of the section, “If any red-skin should take it under his scalp to look about camp, every cuss of them coyotes would shut his trap and wake the fellers up with the quiet.” As the small hours of the night come on, a few of the wolves will steal into camp to secure edibles which have been carelessly left within their reach. At times they are so bold as to attempt the theft of a haversack of food upon which the head of a sleeper is pillowed, but seldom if ever will they make any attack upon the persons of the campers. As dawn comes the howling ceases, and a majority of the coyotes betake themselves to their burrows. Those wolves which linger retire to a safe distance from camp, and there, squatted on their haunches like dogs, await the removal of camp, hoping to secure a few scraps of food which may have been thrown away or abandoned.

It is an old saying among Plainsmen, “That the coyotes can smell a *States feller*, and then you will not see a coyote any where within rifle-shot of camp.” A considerable experience goes with the Plainsman to bear him out in this assertion. “*States fellers* shoots at any a live thing as jumps in their sight, whether it is any

'count to them or no," remarked an old hunter. Possibly this waste of ammunition may, to some extent, account for the supposed keen scent of the coyotes.

The weather on the Plains during the month of November is frequently the most delightful of the entire twelvemonth. It is just cold enough to make the air, pure as it ever is, bracing and exhilarating to man and beast. To the hunter it is the prime season for the enjoyment of sport, and the successful chase after buffalo or such other game as his fancy or need may lead him to pursue.

Trading outfits, taking advantage of the "fine days," start out toward the proposed wintering places of the Indian villages with which they are to locate for the season. The great trains of wagons which are being moved across the Plains to Colorado, New Mexico, and the more western Territories, make many more miles of travel during these good freighting days than at any other season of the year; for the roads, dry and hard as they now are, can not be surpassed by any natural roads in the world; besides this, both man and beast can travel a longer distance without being overcome with fatigue than is possible during the less favorable days of extreme heat or intense cold.

This is the Indian summer, a season which the Indian regards with distrust. It may last until well into December, or the winter storms of which the Indian considers this fine weather as the precursor may come on within a few days. The red-skinned aborigine will frequently take advantage of the bright days to commit

any depredation which he may accomplish with tolerable safety, for the red brother is thinking of making tracks toward some government post, where, after a peace talk, he may settle down for the winter and not go hungry, as he will if he follows the village, which ere this is moving southward, in company with or on the trail of the great herds of buffalo, and other game that has left the Platte, Republican, and Smoky Hill rivers for the more temperate climate of the country to the south of the Arkansas. It would be more proper to qualify the statement that the Indian would go hungry: by this it is not meant that he would starve, for there is too much game, in any section of the Plains where a considerable band of Indians would winter, for actual starvation; but flour, sugar, coffee, and some other articles of food used by the whites, are a pleasant change to the redskin after his long subsistence upon a diet composed entirely of meat.

This pleasant weather, the season for the enjoyment of a trip across the great buffalo range, is closed by the winter storms. A dry, powder-like snow will fill the air and cover the landscape. Then will come days and nights of such freezing cold as chills the very bones of the hardiest of the brave fellows whose life is spent in this wild country. The wind is of such cutting sharpness that it penetrates the ordinary clothing, and can only be kept out by the blankets and robes which must be used during a winter on the Plains. Will Comstock was wont to advance a theory, "That the air was so thin on the Plains, owing to the altitude of them, that

A FREEZE.

AN ARMY HOME.

no cloth could be made so fine that the wind could not blow the air between the threads."

If, as is sometimes the case, these great storms come on unusually early in the season, there will be a heavy loss of cattle in the freighting trains, and the suffering of the bull-whackers and hands connected with the *outfits* is indescribably severe.

During the winter of 1865-66 not less than ten thousand head of oxen were frozen to death on the three great routes, the Platte, Smoky Hill, and Arkansas. Instances were numerous of trains meeting with the loss of two-thirds of their stock during a single night. This great loss of cattle is not the sum total of the misfortunes which befall the freighter or owner of the train. Some time must elapse before cattle can be procured to replace those which have been frozen, and the proprietor of the caravan assures us that "during this interval *them* bull-whackers and train-hands are a eating their cussed heads off four or five times over." This is a rash statement, certainly, for a man to make who knows that the men, having *corralled* the wagons (that is, arranged them in the form of a circle for the purpose of securing the stock, and affording a means of defense in case of an attack by Indians), have proceeded to get out the well-worn and thoroughly marked decks of cards. How much poker or high-low-jack they will play depends on the length of time they are forced to remain. They do not waste the daylight, but improve, at poker, each little shining hour. These patriots would scorn to play a game of draw for unvalued corn. The game must be made interesting in some way, the discovery of which is the great drawback to the enjoyment of their situation. Money they have not, for the bull-whacker—sailor of the great land-ocean as he is—differs not a whit from the genuine salt in the time-honored habit of spending his last "show of color" before leaving the settlements.

They will play "freeze out" poker to see who among them shall hunt the next sack of chips;

that is, trudge about kicking up the snow in quest of buffalo chips (*bois de vache*), to be used as fuel. Which man shall herd the stock; which stand guard. Thus duties become to some extent a gambling property—a bank to be drawn upon "to make things interesting." In this beguiling away of time the bull-whacker learns to "handle the papers" with a dexterity not surpassed by the sharpers who keep the Eldorados, Occidentals, Progressives, and other saloons of similar names which disgrace the mushroom towns that seem the fungi of the Great Pacific Railroad.

It is during this season of bitter, penetrating cold that some of the "ladies of the army" learn to appreciate the situation which they have accepted as Mrs. Captain —. Ladies of refinement and culture frequently accompany their soldier husbands to the newly located frontier posts, where they may oftentimes live month after month in a hut, the lower half of which is a pit dug in a convenient bank, and the low wall built around it is mainly composed of sod cut in squares and laid up with mud. The roof is usually of saplings and earth. Seen from without, this structure is in appearance the veriest hovel that one can imagine. Step within, and you will be amazed at the very cozy aspect of the interior. The walls have been smoothed, then mud-plastered, and finally have been treated to such numerous coats of white-wash that they seem to be plastered. It is a successful counterfeit of a tolerably comfortable room in some decidedly more pretentious structure; though, after all, not quite the place that a person would choose as the abiding-place of his family. It is in such quarters as the one just described that many an officer's wife has lived, and more than one officer's child has been born. Rude as the place may appear to Eastern eyes, this is as warm a nest as the little ones could have during the winter season on the Plains. Young ladies who visit West Point during the summer months may possibly be interested by the announcement that these sod huts are fast

being abandoned as officers' quarters, and at nearly all military posts which have been located longer than a few months comfortable structures of stone have been erected for the accommodation of the garrison. The usual building material used in the construction of these quarters is the excellent, though somewhat singular, sandstone that is found in unlimited quantities in nearly every location where a government post is likely to be established.

A word in reference to this prairie stone. When first quarried it may be shaped into convenient blocks by means of an ordinary saw, such a one as is designated in the lumber districts as a "cross-cut." It is quite common to see the masons while engaged in laying up a wall make use of the carpenter's saw to shape any block which may not precisely suit the position which the stone is intended to fill. Exposure to the atmosphere soon renders this soft stone as hard and firm as the best description of sandstone. In color the prairie stone is varied and pleasing.

The sketch of an army home will convey an idea of what are, or were, the quarters of the commanding officer of Fort Dodge, an important military post on the Arkansas River. During the past winter this was one of the dépôts for the supply of the troops under General Sheridan. Possibly the Major has moved his family into the more respectable quarters that have lately been constructed of the prairie stone; but a warmer abode than the sod hut on the banks of the Arkansas he will never have. The innumerable hardships and deprivations that a woman must necessarily suffer if she ventures upon the Plains

would seem sufficient to deter the most energetic female from the trip; but no! nearly every post has its ladies, who undoubtedly do much to keep up the respectability of the place, and restrain the too free license which is common at posts where there is no "lady of the army."

Indians frequently visit the military posts during the winter months. They are as willing to trade during these visits as any Yankee peddler would be, and quite as sharp at a bargain. To an Indian there is no limit as to articles which may be secured by trade, if the party desirous of the article can offer sufficient inducement. A Kiowa chief endeavored to consummate a bargain for an officer's wife, offering as equivalent such a number of fat dogs that the Indians present, thinking that the officer could no longer withstand such a tempting offer, expressed a willingness to help eat the dogs if there should be more than the white chief could manage to dispose of himself. Ladies, there was no trade.

In trading among themselves the Indians exhibit all the shrewdness and cunning which is the prominent characteristic of the race. The possessor of a coveted article takes care to turn it to the best advantage. A scene illustrating this took place on the banks of a small stream, or, to use an Indian expression, Turkey Creek, which empties into the Pawnee Fork near its junction with the Arkansas River. A Kiowa village was located here for the winter, in a fine grove of old cotton-wood-trees. The fact that the village was rich in buffalo-robcs and other skins became known to a band of the Cheyenne tribe. Stealing would not answer, as there were

SHARP TRADE.

too many Kiowas and too few Cheyennes. Some bottled whisky was obtained by the Cheyenne, how is something of a mystery, as white traders seldom make use of fire-water in their barterings with the red man.

With their whisky the Cheyennes proceeded to the Kiowa village, exhibited their bottles, and dispensed smells from uncorked bottles of corn juice—giving a judicious shake or two to the bottles, that the aroma should be more entirely appreciated by *their friends, the Kiowas*. The smells were freely taken, and produced an uncommon desire to know more of the Cheyennes; pipes were produced and duly smoked; after which the visitors announced their willingness to trade. "They had not brought much whisky, as they did not know that their brothers the Kiowas would like to see it. The little which they had with them was good, and very strong" (with water); "when the Kiowas had tasted of it they would see." The Cheyenne was liberal; he would give so much for a robe (holding up the bottle and marking with the thumb something like half an inch of the whisky). "But seeing that the Kiowas were not in haste to trade, the Cheyennes would smoke with them." Meanwhile a kindly-disposed bottle-holder was dispensing smells of the whisky to a few Kiowas who were loud in their announcements of the number of fine robes which they possessed. This second smoke was quickly finished, and the Cheyenne exhibited the quantum of fire-water, marking it as before by the location of the thumb on the bottle. A general exclamation followed—the position of the thumb was to the Kiowa's eyes so very much higher on the bottle. But Cheyenne had no more consideration than a New York landlord, if the accommodation offered looked small for the price. The trouble was with the eyes of the Kiowa, which could not be expected to see big like those of a Cheyenne. Another smelling time took place, and produced an instantaneous exhibition of tin cups and robes on the part of the Kiowas. During the pouring out of the promised grog the position of the thumb was regarded with too close a scrutiny on the part of the robe-sellers to permit of any shoving up of the gauge, and it is only justice to the bottle-handlers to say that when they held up the bottle for exhibition after each pour, no Indian could detect any variation of the line of the whisky and the point indicated by the position of the gauging thumb.

The Kiowas did not get drunk, and the Cheyennes left the village on foot, all their ponies being loaded with robes—having, as they were free to remark, made "a heap sharp trade." When an Indian has secured any considerable quantity of the ardent beverage, and intends in company with a few chosen companions to get drunk, all arms are carefully laid aside, that no blood may be shed during the spree—a precaution which many of the white brothers who have lived on the frontier until they are

but a trifle less wild than the Indians might do well to imitate. It may surprise some of the readers of this article to learn that many of the Indians will not drink, and not a few regard whisky with aversion. These do not, however, exert any powerful influence in restraining the many redskins who are fond of the article. The latter will have it at almost any price.

There is a tradition among the Indians which tells of the death of a number of the warriors of a band which found some whisky that had been left by some whites, who were *en route* across the Plains. The Indians drank the stuff, and a number of them died shortly, which induced other Indians to believe that a trap had been set for them. This affair has made the Indians very careful in handling food or liquor which they may find under circumstances which may in any way indicate that the articles have been left for the redskin to find. The tradition does not state which way the party having the whisky was traveling. If they had come from Colorado, and permitted the Indians to get their hands on the genuine "Colorado round the corner," there is no wonder that the Indians bent a trifle under the weight, as the oldest settler in the Territory can not take much of the genuine Denver make and live to go any distance with it.

Winter is the "at home" season of the Indian. The intense cold makes the comfort of a warm lodge or tent of dressed buffalo hide appreciable. (*Tepe* is the Indian name for the lodge.) It is the season of rest for the Indian, who, if he would go on the war-path, must, unless the winter is very open and the ground tolerably free from snow, take the trail on foot, a mode of traveling which the Plain Indian, accustomed as he is from boyhood to the pony's back, does not look upon with favor. This disinclination to walk may to some extent be accounted for by the fact that these Indians are generally very inferior pedestrians. To use the ponies even during a short campaign would so weaken and injure the tough little nags as to render them unfit for the most moderate service during the remainder of the winter. The wintering place for an Indian village is mainly selected on account of the condition of the grazing or grass in the vicinity. And even on this chosen ground the stock has, to use a Western expression, "a hard scratch for their rations;" to obtain which the herd will wander over a considerable extent of country each day, and spend nearly all the time in feeding, which could not be the case if the stock should be used on the war-path, where the grazing would be entirely accidental, and inferior to that enjoyed in the vicinity of the village.

While in the village during the winter season the Indian has numerous ways of enjoying himself—gambling, trading, dog-feasts, dancing, squaw-fighting, and other things too numerous to mention. The mention of squaw-fighting may not be understood without some word

of explanation. It is this: the squaws have continual bickerings, disputes, and jealousies, and continually quarrel among themselves about the most trivial affair. To promote these wordy encounters into a regular scratching and hair-pulling scene is not difficult, and affords a pleasing excitement to their excellent husbands, who frequently make use of pony-whips to encourage a squaw who does not seem to enter with sufficient vigor into the strife which she has on hand.

The ill-treatment received by the squaws at the hands of the bucks, or male Indians, would seem to be sufficient to extinguish all love and feeling of respect toward these unfeeling specimens of the genus *homo*; but no, the regard of the squaw for her lord, and the tender love which she ever exhibits toward his children, might be imitated to the decided advantage of the more civilized occupants of what was once Indian ground. The little toys made by the squaws for the amusement of their children are as novel and curious as any of the Indian curiosities that may be seen in the village. Many of these toys are simply miniature reproductions of the larger articles which are in actual use. The pappoose has its doll baby almost as soon as it is able to crawl; and, unlike the baby of the white man, the Indian infant does not make the dolly's head a favorite article for the occupation of its little mouth. The get-up of this Indian doll baby is remarkable. A queer representation of an Indian is made of buckskin stuffed with hair. The eyes, nose, and mouth are represented by beads; its garments are those of the Indian, and consist of breech-

cloth, leggings, robe, and moccasins; a small fragment of a scalp is sewn on the top of the doll's head, and so arranged as to permit of its being lifted up to exhibit the character of the article. This little scalp is braided and arranged precisely like the hair of an Indian. Taking the whole affair, sewn as it is with fine sinews, you have one of the most curious of doll babies. An Indian child can hardly stand alone before it may be seen with its bow and arrows. These latter articles are never sharp, but made large at the end to give steadiness of flight and prevent damage to the children and dogs that are continually being shot at. Sharp arrows and stronger bows are given to the boys as soon as they are old enough to be trusted to go short distances from the village in quest of small game.

In an article on "The Buffalo Range," published in the January Number of this Magazine (1869), the author of this article gave some account of the labor of the Indian squaw in the preparation of the buffalo-robe as it is seen in use among us during the winter season, but made no allusion to the method resorted to by the squaws in preparing the bison skin as leather, to be used in many ways for the use and comfort of the nomads of the Plains. The hides that are principally used for this purpose are those which would make an inferior robe. They are first soaked for a considerable time in water, for the purpose of removing the hair, which, when treated in this manner, comes off easily. The hide is then stretched upon the ground by means of wooden pegs driven through slits cut in the edge of the skin, and treated to

FAMILY AFFAIRS.

a thorough rubbing with water in which buffalo brains have been allowed to remain until partially dissolved. This renders the skin flexible, and leaves it in a semi-tanned condition. The next performance is to rub, scrape, and grind the skin down to about one-half of its original thickness, when it is again treated with the brain-water until thoroughly cured, after which a preparation of whitish clay is rubbed into the leather, and it is ready for use. A tepe or lodge made of this skin invariably seems to me a monument to the industry of the squaws that occupy it. A tepe is seldom to be seen that is composed of fewer than ten hides, and some contain as many as eighteen. The skins are invariably sewed together with sinews, and so neatly that close examination will be certain to elicit commendation from any frontier's or ranch man, who has, from necessity, some knowledge of the use of the needle himself.

Located, as an Indian village usually is, in some grove of ancient cotton-wood-trees, these skin lodges, with their poles—the upper ends of which are jetty black from the smoke of the fire within the lodge—projecting a few feet above the skin covering, present as picturesque a sight as one can well imagine. You will notice while in a village that the tents vary in size, and naturally enough fancy that the size of the tent is to some extent regulated by the number of its occupants; but in this you would be mistaken, the larger tents being more frequently the abode of the rich Indian—the brown-stone fronts, as it were, of the city, and not the modest brick, which investigation would show to contain double the number of occupants that the more pretentious establishment boasted.

The paintings, or such attempts at the representation of objects, and characters that appear on the lodges frequently afford amusement and instruction. Short anecdotes, rather than any very lengthy history, are the principal things to be gleaned from the production of the Indian artist; and, as each Indian will endeavor to tell the yarn which will go the farthest toward producing the impression with the decipherer of his characters that there is a very big Indian to be met in that tepe, you may see some rather strong statements. You are not required to express any opinion with reference to them; so believe or doubt, as you may choose. The entrance to the lodge is arranged with an affair which may be called a door, inasmuch as it is used for that purpose and is decidedly like one. It is simply a willow or other pliant rod bent to form an oval, and covered usually with a finely-dressed deer-skin, on which is wrought or painted the device which represents the name of the occupant—a sort of a door-plate of the gentleman whose home it is. Open this and go in. For a moment you will find too much smoke to suit your convenience, or rather eyes, but seat yourself on any of the numerous robes and you will see that the lower one crouches the more comfortably he will arrange himself with reference to the smoke.

Each tepe is provided with two or more lounges or mats made of small willow rods strung upon strong sinews. These "resters," as they are designated, are fastened by means of a leathern loop to a tripod composed of three strong sticks of four or five feet in length. Try one of these and see what a comfortable lounge or spring-mattress the Indian possesses in this portable bundle of rods. This Indian bed, like nearly every thing else in the tepe, is decorated with the colors of the tribe. Scattered in all directions are bags of all sizes and descriptions. The Indian seems as partial to this manner of baggage as a sailor. To the Indian this bag show is a necessity, as it enables the squaw to break up housekeeping at a moment's warning, and thus materially assists the rapid movement of a band which may have short notice of the near approach of danger. In such a case the numerous small bags are hastily thrown into large ones, the tepe comes down, and the village is on the move in less than half an hour, the lodge poles serving as a drag on which the tents and furniture are packed.

In the Indian tent may be seen, too, the various implements made use of by the lady of the house in her domestic arrangements—mallets made of round stones of a variety of size and weight, fastened securely to wooden handles by means of raw hide, which is sewn while green and pliable. This, when dry, becomes so hard and firm as to bear a strong resemblance to horn, and thoroughly dry and seasoned will turn the edge of the sharpest knife. A well-made shield of raw hide, selected on account of its thickness and other necessary qualities, will turn an arrow, and oftentimes a rifle-bullet which does not strike the shield in a direct line.

But this is a digression from the attempt at cataloguing the contents of the Indian's tent. Furs of all of the different animals of the Plains are, of course, plenty; so, too, are the feathers of the various birds that are to be found in the section. These latter articles are mostly secured by the boys, who thus take their first lessons in hunting, and supply the squaws with the material for winging arrows and decorating such articles as they may design to make a show with. Possibly it may be unnecessary to mention the fact that the squaws make the bows and arrows used by their lords, as it seems to be tolerably well understood that the squaw does the labor that is done in an Indian village. The Indian's paint may be seen about the tent, each color in a receptacle of horn, carved and otherwise decorated; bundles of straight sticks to be made into arrows; scraps of iron to be made use of as heads for the arrows; strange affairs made by bending a light rod to form a circle of eight or ten inches in diameter, and crossed with a net-work of sinews, affording the Indian a plate from which to eat food that is not of a liquid character; great raw hide envelopes, three feet in length by two wide, and considerably painted. The squaw's

INDIAN VILLAGE IN WINTER.

FEEDING GROUND OF THE ANTELOPE.

trunks are also necessary articles in the Indian's household, and visible in every tent. Bundles of dried or jerked buffalo meat, and sticks or strings of this article of food, are seen thrown about with entire disregard as to the cleanliness of the location. Altogether the interior arrangement of an Indian's tent is the reverse of tidy.

In nearly all villages it will be found that seven or eight Indians occupy each lodge. Of these two may be reckoned as warriors, or bucks who are capable of taking the war-path. In any attack upon the village it will be discovered that there are more than two fighters to each lodge, for women and children will then go into the affray with quite as much disregard of personal safety as the most highly painted brave. On such occasions, too, it is almost impossible to distinguish the squaws from the bucks, as their dress is in many instances nearly the same as that of the men, and the side-saddle is not an article to be found in an Indian village.

An Indian encampment during the winter affords a novel scene. The youngsters are engaged in noisy sport. The bucks are lounging

about, or seated in a semicircle for a smoke and talk. The squaws are busy with their various duties. It is a sort of Indian paradise, watched over by the keen-sighted old warriors, who have perched themselves in the most convenient locations for an extended view, in the contemplation of which they will remain for hours, wrapped in their warm buffalo-robcs. These shrewd old sentinels can distinguish objects at a distance that would seem to the untutored eyes of the white man an impossibility. The safety of the herd and village is the care of these watchers. This is the Indian village during peace time, which, until the past season, was simply winter, or when it was inconvenient for the Indian to go upon the war-path. As a usual thing the Indian, in selecting his winter-quarters, takes care to locate the village where his food is likely to be most abundant. Buffalo, deer, antelope, turkeys, and other game are so plenty on the Plains that the Indian, when allowed to follow his own inclination, will not be likely to suffer from hunger for many years to come. Buffalo may be seen in great herds, spreading over the Plains for miles. Deer are to be met with frequently; antelope

cover the hills to the south of the Arkansas, flocks numbering thousands being by no means an uncommon sight. Wild turkeys, too, are found in droves.

Will it be an easy task to keep on reservations several thousand Indians that have known no other than a roving life, with these vast herds of game as their store of food, and the white man's goods and property theirs if they can take it? It must be remembered, too, that the bravest, best-armed, and most troublesome band of Indians that is on the Plains has escaped without punishment for the numerous depredations which were committed by them during last summer and fall. This one band—the "Dog-soldier Cheyenne"—has committed two-thirds of the depredations that have occurred on the Plains. With these Dog-soldiers at large and unwhipped there is not much likelihood of entire peace on the Plains during this summer, though it is probable that the Indians who were made to feel the power of the United States Government last winter will be somewhat careful about joining as a body in any extended forays against the white brother. But it is not improbable that a number of warriors from the different tribes located by General Sheridan upon reservations will go on hunting-trails which will end somewhere in the immediate vicinity of the camps of the Dog-soldier Cheyenne. This is not surprising either. Wealth is to an Indian the passport to a select location in the happy hunting-ground; and until the "untutored savage" learns by many a hard knock dealt during the winter season, when the Indian admits that he can not fight, there will be Indian troubles. Generals Sheridan and Custer have simply taken a first step

—possibly this will prove a long one, but experience would seem to teach differently.

The moaning and lament that took place in the Cheyenne tribe after Custer's splendid success in punishing them for the long series of outrages upon the whites was, to use an Indian mode of expression, "heard in the wind that blew on many villages;" and the cuts and bruises that the mourners inflicted on themselves are too fresh for these Indians to make haste to merit such condign punishment as Sheridan promised if they did not keep their barber-ous hands off the white brother's poll. The death and burial of a single Indian is an affair of no small importance in a tribe. If the lost one be a child, the mother is tolerably certain to have a joint of one of her fingers amputated. This, it seems, is an intimation that the hands were not quite up to their work, or the child would not have died.

The arrangement of an Indian corpse is a matter that requires time and much mummery; after which the dead are furnished with the necessities—food, arms, tobacco, etc.—to be used during the trip to the much-talked-of happy hunting-ground, and the whole is incased in an outer covering made of willows arranged in a similar manner to that in which the lounges are constructed. More mourning is done; after which the body is placed upon a platform constructed for the purpose in some ancient cotton-wood-tree. The feet of the departed Indian are turned with care to the southward, for it is there that the Great Spirit has his abode—so the Indian will tell you. In some favorite groves trees may be seen the branches of which have been heavily freighted with the remains of departed Indians, and eight or ten

INDIAN BURIAL-TREE NEAR FORT LARAMIE.

bodies may be disposed among the branches. A scaffold located on a prominent knoll or bluff seems to rank next to the tree as a proper place for the last rest of the Indians' dead. The Plain Indians—such tribes as the Comanche, Apache, Cheyenne, Arrapahoe, and Kiowa, the best riders among the Indian tribes, and users of the longest bows and arrows—are the Indians that resort principally to this elevation of the dead, though even these will sometimes dispose of their departed brethren by burying their bodies in the ground. The foot Indians of the Plains are few in number, peaceful, and poor, so the Cheyenne say. These Indians almost invariably bury their dead in the ground—taking care, however, that the departed spirit shall have the usual outfit of food and extra wearing apparel.

The destruction of the trees in which Indian bodies are located is not calculated to make the Indians very peaceful when they next visit the grave-tree; and it is to this wanton destruction of Indian burial-places that much Indian trouble may be traced. The Indian complains that the white destroys the fuel that the Indian could use for many years; and this is very true, for the white man cuts down the tree, where an Indian contents himself with lopping off a few branches. The Indian will make a small fire and warm himself thoroughly; but the white man must make such a blaze as will compel him to warm one side while he freezes the other; and it is quite the same in any fire which either will build for cooking food. Possibly the white man may not enjoy the Indian's favorite method of economizing fuel—that of building a small fire and then sitting down so close to it that a good buffalo-robe will envelop both Indian and fire; but this is an excellent manner to get thoroughly warm, and for the Indian a successful device for the discomfiture of the vermin that infest the race.

ECONOMY.

It is something after this style that the Indian takes the vapor-bath, that seems with him a standard remedy for many diseases. The

mention of this fact brings to mind the excellent collection of botanical and mineral medicines that may be found in the tepe of nearly every redskin. For the collection of these simples the Indian has his stated seasons, during which all the inhabitants of the village are engaged in the preparation of the medicine bags that are to be kept ready for use in case of need. Many of the old hags that one sees in the village are excellent nurses for the sick, and frequently prove themselves capable leeches. It is to these wise old squaws that many a wounded Indian owes his life, for they have most excellent salves and ointments for damaged flesh.

Give the Indian his due, he is, if "left alone"—that is, not tempted by the sight of the white man's goods and stock—entirely capable of taking care of himself in almost any situation that he may choose to locate; for, by following the great herds of game, he has ever at hand as much food as he may desire, and the hides and other portions of the animals will serve for use in the manufacture of such clothing as he may have need of. The last few lines describe completely the condition of the Indian as the earlier adventurers found him. This is not, however, the present situation. Experience of years has taught the redskin that the white man, as a rule, is afraid of him, and much more ready to make peace talks than he is to fight. The knowledge of this fact has been taken advantage of until the Indian has quite convinced himself that no band of white men that wore the blue clothing of Uncle Sam were to be compared with the redskin, who during the summer season was not the wearer of any covering save dirt and paint.

The reader may not be familiar with the Indian's reason for bedaubing himself with paint, and will pardon a little digression from the direct train of the story if he learns that the colors are not used entirely for the purpose of astonishing a foe, but are found valuable in saving the skin from the constant peeling off that the elements would accomplish if the paint was not used. Vermilion is the best color for this use, a single application of the color, followed by an Indian-like disregard of water, will save to a person's countenance many cuticles that would otherwise peel off one after another, until it would seem that the human face is endowed with as many coverings as a cat is supposed to possess lives. Black is the favorite winter color, and reds and yellows may be regarded as fashionable for the summer. Now for the back track until we reach the point where the trail was left, with a naked Indian to mark the spot.

It has been for years a custom of the government, encouraged by the Indians, to undertake an Indian war during the summer season, and learn by the time the Indian summer came, late in the fall, that the Indians were "too well mounted," "too well armed," "too sharp," etc., etc., to be met upon equal ground during grass-time. Peace talks were then in order. These the Indians like, and are ready to engage in, as

it offers an opportunity to air their fine speech, and must be accompanied with presents in order to meet with entire approval. Loaded with plunder and rich with the stock stolen during the summer foray, the Indians bag up the presents and go gayly away to the villages, where the squaws and children learn that the white men are women—how they arrive at such a conclusion is unknown—and can not fight the Indian. Sheridan had some education in Indian affairs while stationed in Oregon previous to the breaking out of the rebellion. Forsyth and his scouts took a rattle at the Dog-soldiers; or, rather, they tried to make his command a skeleton one—and it certainly would have been such had the Indians succeeded in the first charge which they essayed against the scouts that fought with Forsyth on the island near the Chief Creek fork of the Republican. Next General Carr had a hand in, and used his opportunity to the best of his advantage. These fights occurred during the fine weather which precedes winter. It was not that the white men forced the Indians to fight, but an entire willingness on the part of the Indians to make the attack, in which they evidently hoped to crush the white men with the first onset, and failing in this, they were ready to continue the fight with a persistence almost unknown in the annals of Indian warfare. Custer's "Garry Owen" fight on the Wachita was the clincher, and demonstrated to the Indians the fact that a white "walk-a-heap pony-soldier" could and would endure the hardship that an Indian shrinks from—that is, fight in the winter season. This gallant fight of the Seventh Cavalry brought a wail of lamentation from the Indian agents as well as the redskins, for it demonstrated to a certainty the fact that General Sheridan was capable of fulfilling his promise to take care of the Indians for them if the agents should prove incapable of doing it themselves. The tidings of Custer's fight no sooner reached the Indian villages, which were scattered through the game country south of the Arkansas for the winter, than the different bands made haste to heed the invitation extended in the fall to come in and be located upon reservations.

If the Indians can be persuaded (which is doubtful) to remain upon the reservations allotted to them by the government, settlers will hasten to take up the excellent land along such water-courses as Walnut Creek, and the country will in a few years derive sufficient benefit from the land brought under cultivation to repay the enormous outlay that the handling of the Indians will at first require. Let the fact be thoroughly well known throughout the country that the army officer can not with safety engage in any traffic with the Indians and retain his position. The citizen can, and will, sell to the Indians whatever article he can make the most money on. If, then, the Indians are under the charge of civilians, the Indian troubles will be quite likely to continue until the redskin is no more. It is not a pleasant em-

ployment for the soldier, this Indian campaigning, and few officers will be found who are anxious to spend their lives in any long period of service in the Indian country. During the past winter, which was not as hard as is usual on the Plains, officers and men engaged in the Indian campaigns that *seem* to have resulted so successfully have suffered untold discomfort and privation. They led a life more severe than that of the trapper or frontiersman, who is to some extent prepared for the cold. Men and animals were worn down until they were absolutely unfit for further service, and many of the men will feel the effect of the Indian campaign of the winter of 1868-69 until the last moment of a life which will be shortened by it.

General Sheridan, in speaking of the extreme suffering of the troopers under his command last winter, says, "The cold was something indescribable. The men's eyes seemed to freeze up, and their clothing became crisp with the frost which chilled to the bone. Those among the men that suffered from snow blindness resorted to the Indian custom of the buckskin strip, simply a band or ribbon of buckskin with narrow slits cut in it, through which the man may look and not suffer from the dazzling glare of the snow." General Sheridan is confident, too, that Roman-nose, the great war chief of the Cheyenne tribe, was killed in the battle fought last fall by Colonel Forsyth, at the Chief Creek fork of the Republican. Should this prove true, there is every reason to believe that there will be no need of repeating the winter campaign on the Plains, as Roman-nose was the great hater of the white man, and the bravest and best fighting Indian on the Plains.

The endurance of the white man, when fairly tested against that of the Indian, will be found equal, if not superior to it, as not a few small bands of Indians have discovered to their cost, when they have taken advantage of an unguarded moment to stampede the horses of Plainsmen or scouts. Years have passed since the December day when, just at the crack of dawn, a small band of Arrapahoe, that was *en route* from the forks of the Platte toward the south, took every hoof of stock from a party of hunters, whose camp had been for two days some twenty miles west of the island where Forsyth and his scouts made their gallant fight last fall. The Indians did not fire a shot. They were after the stock, and not a fight; so through the camp they went howling like demons—each Indian armed with a buffalo-robe, which he swung through the air, frightening the ponies into breaking lariats and drawing knots and picket-pins. But the stock was not so cheap, after all; two Indians left their remains as a wretched equivalent for nine good saddle animals. Give the devils their due: the stampede was a success, and a little party was afoot that did not take kindly to the situation. Before sun-up that same party was on the trail of the stolen stock, carrying just as little *duffle* (food and

THE STAMPEDE.

clothing) as could be made into a small pack for the back.

The story of that trail would be too long a narrative. Day after day the little band toiled on, the greater portion of the time through snow which had crusted just sufficiently to break through under foot. The suffering for food was intense enough to make any live animal a coveted treasure. But two of that party are now alive. One by one the Indians got them.

During the cold spell, as the Western man is prone to designate winter, the dug-out is a favorite abode of the genuine Plainsman. With his long experience he knows no warmer location than a cave dug into the bluff or bank near running water. It is a safe retreat too; and a great many Indians would hesitate before attempting to unearth a customer whom they prefer to let alone—the frontiersman in his wintering-place on the Plains.

THE DUG-OUT.

MILITARY PYROTECHNICS OF FORMER DAYS.

ENGINE FOR THROWING GREEK FIRE. THIRTEENTH CENTURY.

SEVERAL French works* have been published in late years under the authority of the French Government on the origin and history of the employment of explosive and deflagrating missiles in war, which throw a great deal of light on the subject, and tend to correct many erroneous ideas which have long been prevalent in relation to it.

The predecessor of gunpowder in the history of war has always been considered to be a wonderful combustible known as *Greek Fire*, of which the most marvelous accounts have been circulating among mankind during the past two or three centuries. This Greek fire has been supposed to be a combustible possessed of most astonishing properties. It was capable of being thrown so as to envelop whole buildings, and even to overwhelm and destroy complete battalions on the field. Water would not extinguish it, but only made it burn the brighter. Nothing would put it out but drenching it with vinegar, or covering it with sand. Its composition, it was supposed, was lost in the fourteenth century, and had never been recovered. The fact that the art was lost was inferred from the fact that no substance possessing the won-

derful properties attributed to the Greek fire can be produced at the present day.

It is somewhat difficult at the present day to obtain exact information in respect either to the composition of this substance, the construction of the engines or other apparatus employed in projecting it, or to the effects which it really produced. In respect to the machinery, and the form of the missiles, we must remember that there were no pictorial papers in those days, and no photography to preserve for future generations the exact realities of form and structure connected with the pursuits and usages of men. And in regard to the other points, relating to the properties of the substance, and the actual effects produced, far less reliance can be placed on the statements of even intelligent, cultivated, and careful men than might be supposed at the present day. For the line of demarcation between the natural and the supernatural—between what is and what is not scientifically possible—was then very vague and obscure, even in the highest minds. Ideas of the natural and supernatural were mingled and confused, or rather the supernatural was regarded as a legitimate realm of the natural, so that no tale could be so marvelous as to seem incredible, even to a grave and cautious historian. At the present day the recitals of excited or terrified witnesses, whose imaginations or whose fears lead them entirely to misconceive what they see, are at once corrected by that general knowledge of the relations of cause and effect

* The titles of the principal of these works are: *Sur l'Introduction en France de la Poudre à Canon*. Par M. LACABANE. Paris, 1844; *Du Feu Grégeois et des Feux de Guerre*. Par MM. REINAUD et FAVÉ. Paris, 1845; *Etudes sur le Passé et l'Avenir de l'Artillerie, Continué à l'Aide des Notes de l'Empereur*. Par FAVÉ, Colonel d'Artillerie; and *Histoire des Progrès d'Artillerie*. Paris, 1862.

which now prevails so extensively among all well-informed men that the bounds of the possible can not be very easily transgressed in narrations generally received. But it was not so in those early times.

In respect to the apparatus by means of which the compound of combustibles known as Greek fire was projected into the enemy's works, some representations have come down to us, though only from comparatively modern times. The use of such means of attacking the vessels or fortresses of the enemy seems to have been resorted to in very early times, since allusions to them occur not unfrequently in the works of writers who lived and wrote several centuries before Christ. Indeed, one of the recipes for making such compositions, as they were employed in those early days, is still extant. It is as follows :

"To make an unquenchable fire take pitch, sulphur, tow, manna, resin, and the scrapings or saw-dust of resinous wood, such as torches are made from. Mix these substances well, then light the mass and throw it against whatever you wish to set on fire."

It is obvious that such a mixture as this would form an exceedingly combustible compound ; but it could not possess any of those marvelous qualities which were attributed to the Greek fire. It could not burn under water, though some substances, as will presently be explained, have this property.

The use of combustibles of this character seems to have been first resorted to in the countries lying about the eastern shores of the Mediterranean—unless indeed the Chinese, and some of the other Oriental nations, anticipated the Europeans in this, as they have done in respect

to many other important discoveries. The reason why the use of such a mode of warfare appeared first in these Oriental countries is supposed to be because in that region are found natural deposits of certain combustible fluids, such as naphtha, and other vegetable oils, which were admirably adapted to this use. At any rate the employment of such substances appears first conspicuously in history in the time of the Greek empire. A great many recipes are extant describing the different kinds of composition employed. They all, however, consist of a mixture of simple combustibles, depending for flagration on access to the air.

These substances were placed in barrels, balls, or other receptacles, and thrown by means of various mechanical contrivances known in those days into the works of the enemy.

The *Slinging Engine*, represented at the head of this paper, was constructed to throw a barrel of the combustible compound by means of a gigantic sling, seen in the engraving as thrown open from the end of the beam, after the projection of the barrel. The beam was drawn back by means of the rope wound round the capstan, shown behind and below it. Its elasticity, after being thus brought into a state of great tension, was then suddenly released, when the end of the beam, carrying the barrel of combustibles, previously set on fire, was thrown violently forward and the barrel hurled from the sling, all in flames, into the works of the enemy.

A battering engine, the design and operation of which is obvious, stands by the side of the sling.

The subjoined engraving, copied from an illumination in a Latin manuscript of the thir-

COVERED RAM AND FIRE-SHIP.

CRANE-RIGGED FIRE-SHIP.

teenth century, gives a representation of the mode of employing the Greek fire in naval warfare. The craft here represented seems to be in some sense the prototype of the modern bomb-proof, ram, and fire-ship, all in one. But although this drawing is taken from an ancient work, no absolute reliance can be placed on the details of the construction as represented in it, inasmuch as such drawings were made in those days for purposes of embellishment, and not for instruction, and so only a general resemblance to the natural object, sufficient to suggest its character and use to the mind of the reader, was all that was usually aimed at. It was, in other words, the *ideal* and not the *actual* presentation which the artist had in mind.

All that can be certainly inferred, then, from such an illustration is, that a species of vessel was made use of in those times covered with a roof sufficient to protect the navigators from spears and arrows, and provided with a pointed prow to act as a ram, and projecting beams bearing barrels charged with materials for producing the Greek fire.

Another form of vessel is given in an ancient manuscript, differing materially from the last. In this the barrel containing the fire is suspended from a species of *crane*, by means of which it could be swung over the decks of an enemy's ship when in close quarters. In this, as well as in the other case, all that we can infer from the drawing is the general nature and design of the contrivance, and of the principle

on which it operated. The true proportions of the parts and the details of the construction were purposely disregarded in illustrations of this kind.

Observe in the engraving the extra barrel of combustibles ready upon the deck, and the circular watch-box on the top of the mast, where a look-out-man could be stationed, under protection from the spears and arrows of the enemy, and yet at the same time in a position to observe every thing through the slits in the box, and so to direct the helmsman in guiding the vessel. Weapons of the character of boarding-pikes are placed, ready for use, at the stern.

The damaging and destructive effects of the Greek fire were not confined to its power of setting the enemy's works on fire. It contained substances which emitted fumes of a horribly offensive, poisonous, and destructive character. It was necessary on this account that the wind should be in the right quarter, that is, blowing from the assailants toward the enemy, whenever it was employed. Sometimes the receptacle containing the composition was placed upon the end of a long spar attached to a car, which was to be propelled by hand. The soldiers would pile up a great quantity of wood before the gate of the castle or strong-hold attacked. This car would then be driven by soldiers stationed behind it, where they were protected by an inclined shield from the assaults of the enemy. The shield is perforated with openings, to enable those within

FIRE-CAR DRIVEN BY HAND.

and behind it to see where to apply the fire; and it contains a place of shelter within, forming a receptacle which would be useful in various ways—among others, for the protection and succor of wounded men, and for taking them back to a place of safety.

By this arrangement the wood heaped up before the door of the fortress might easily be set on fire, and if the wind was in the right quarter, and if the wood had been previously prepared by being covered with pitch, naphtha, and resins, the consequence would be an imme-

diately bursting forth of volumes of fierce flame and suffocating smoke, which would drive over the wall, penetrate the works, and make it impossible for the men to draw near for the purpose of doing any thing to arrest the mischief.

The ancient manuscripts referred to above contain illustrations of the use of the Greek fire by foot-soldiers in armor, or by men on horseback or in chariots of war. The torch borne by the foot-soldier, or by the horseman, was used often for the purpose of setting fire to the wooden works of the enemy, or to heaps of combustibles previously piled up before a gate or other point assailed. There are accounts, also, of large bodies of men being thus armed to operate against a hostile force in array upon the open field. But this method of warfare could not be employed with advantage except when there was a strong wind blowing from the position of the assailants toward that of the assailed. In this case the advancing line would be preceded by a cloud of smoke, consisting of the most poisonous and suffocating vapors, before which no human being could stand.

The lances used in these cases were formed with an iron receptacle for the fire at the end. This receptacle terminated in points at the extremity, which formed a very efficient weapon after the fire was exhausted, or even perhaps while it continued to burn. In the case of the horseman the shank of the lance was supported by a ring open at the top, fixed upon the horse's head, and the horse as well as the man was covered with an iron armor, in order to protect them from any sparks or flecks of flame which might be driven against them by the rapidity of the onward motion, notwithstanding the precautions taken in respect to the direction of the wind.*

Of course combustibles carried in this way

FIRE-ARMED SOLDIER.

* As expressed in the Latin manuscript: *Equus semper sit armatus totus, et equus suus totus barbatus, ne a favillis ignis recipiat passionem.*

could not be sufficient in quantity to burn for a long time. It was necessary to calculate the possible duration of the fire very accurately, and to act, after the fires were once lighted, with great promptness and decision. The object of the enemy, it is plain, in case of such an attack, would be to gain time by falling back, or by deceiving the assailants as to the distance, so as to allow the fires time to burn out. One conspicuous example is given in a combat between the forces of the Sultan of Egypt and those of a Mongolian Khan, which took place in Syria, when a body of Egyptians, armed with lances carrying Greek fire, suddenly appeared issuing from the ranks, and advanced across the intervening plain toward the enemy. But they had in some way or other so miscalculated the distance—or the duration of their fires—that the combustion exhausted itself before they reached the Persian lines. The Persian commander then ordered a countercharge upon them. They were thrown into confusion, and in falling back to their own lines carried confusion with them, and their whole army was put to flight.

- The marvelous tales which have been told in respect to the power of the Greek fire to burn under water have a certain foundation in the fact that, in the times when this agency was employed in war, the method of using it was by packing the materials in a spherical receptacle, in such a manner that when thrown into the water the missile could go down to a certain distance without being entirely extinguished, so that on rising again to the surface the flames would break out anew, ready to set fire to any combustible object that they might encounter. The engraving on page 40, copied from one of the ancient illustrations, gives a general idea of

this operation. The balls thrown from a height into the water would of course sink below the surface, until brought back again by their buoyancy; and there would be no great difficulty in so storing so very combustible a material as that it should retain the fire during this brief interval.

Moreover, if a small quantity of water were injected into a large mass of any combustible material fully on fire, the extinguishing power of the water would be overcome by the quantity and intensity of the heat, and the steam suddenly created would act with explosive force in scattering the burning materials all around. Just this we see on a small scale in a candle, when minute quantities of water in the wick, instead of putting out the flame, only produce a series of sputtering explosions. The explanation of the extinguishment of fire by water is the cooling effect of the water in reducing the temperature of the materials below the burning-point. This effect is due, it is true, not to the simple cooling power of the water as water, but to the enormous amount of heat absorbed by it in being converted into steam.

Of course, if the quantity of water thrown upon a fire is not sufficient to abstract from the fire, by its conversion into steam, heat enough to reduce the temperature of the whole mass of burning materials below the burning-point, it will not extinguish the fire.

The process of combustion consists essentially, in ordinary cases, in the combination of the combustible with oxygen by a chemical action intense enough to develop light and heat. Of course unless air is present, or some other supporter of combustion, this process can not go on. Now the Greek fire, so far as is now known, contained within itself no substance

FIRE-ARMED HORSEMAN.

FLOATING FIRE-BALLS.

that could furnish oxygen, but was dependent altogether on a supply from without. It could not, therefore, continue to burn when the air was excluded. Nor could it possibly withstand the cooling effect of any large quantity of water applied directly to the burning mass.

The transition from the manufacture of Greek fire to that of gunpowder in war, it is now found, was not the result of any sudden discovery, but grew gradually out of the incidental introduction of saltpetre among the combustible substances, which was found in some mysterious way greatly to increase the violence of the combustion. Saltpetre is a substance which is found abundantly in a natural state in the countries where Greek fire was most used. The mode of its operation in changing combustion into explosion was not probably at first comprehended, as the science of chemistry was then practically unknown. It is now, however, understood that the result is due to the saltpetre's furnishing a supply of oxygen to the combustibles, and thus making them independent of the air in respect to their burning. It furnishes the supply, too, in such a way, to every particle of the combustible, by means of the fine comminution and intimate commixture of the materials, as to present to every portion of the combustible a portion of oxygen close at hand, and thus increases enormously the rapidity and violence of the action.

There is another important thing to be borne

in mind, which is, that a mixture of combustibles with saltpetre, by containing within itself the supply of oxygen necessary for the combustion, and thus making* the process independent of the external air, allows of the inclosing of the materials in strong and tight receptacles, so that the gases produced by the combustion may be confined, and so made to exert their vast expansive force—enormously increased by the great heat developed—upon the walls of the receptacle which confines them.

The mode in which saltpetre thus operated in promoting rapidity of combustion was not probably at all understood in those days. It was observed, however, by many persons and in many different countries, as a matter of fact, that the admixture of saltpetre with their other pyrotechnic materials greatly increased the effect, until finally an explosive power was developed sufficient for the projection of missiles from the mouths of open tubes, and then artillery began to appear on the field of battle.

Thus the art of producing gunpowder for the purposes of war seems to have been a growth rather than an invention; and so it is not at all

surprising that the origin of it has been attributed to many different men of many different nations. It is as impossible, as a distinguished French writer has said, to answer the question who invented gunpowder as to say who invented the *boat*.

SAID PACHA OF EGYPT.

MOHAMMED SAID PACHA, third Viceroy of Egypt, one of the younger sons of Mehemet Ali, succeeded to the throne in August, 1854, on the murder of Abbas Pacha, in which crime he had no agency. A woman was the Nemesis of that domestic tragedy, as before described*—a bold, bad woman, who anticipated a similar doom at the hands of the kinsman she distrusted and destroyed; and her only accomplices were believed to have been her instruments, whose subsequent fate no man ever knew. In this world she escaped the punishment of her crimes, which could not be proven, and lived, if not respected, at least rich and prosperous, and died tranquilly in her own bed at last.

But no one in Egypt ever suspected Said Pacha of any complicity in the crime; for any act of treachery or cruelty was alien to his bold, frank character. He was a man made rather in a Western than an Eastern mould—impuls-

* *Harper's Magazine*, January, 1869.

ive and rash even to recklessness, but incapable of fraud or treachery or midnight murder. His first public act was to recall from banishment in Central Africa all the state prisoners who had survived the climate of that Eastern Cayenne, and to tempt back such as had fled to Europe, and even to America, to escape the wrath or the avarice of Abbas. A general amnesty and jail delivery of such was granted, and the prisons of Cairo, the wilds of Central Africa, and remote Europe disgorged the long-suffering victims of the tyranny of the despot under whose rule Egypt had groaned for several years. The reign of Said, therefore, was initiated by a kind of general jubilee, and opened under the happiest auspices.

He was an educated man, Mehemet Ali having placed him under the charge of an intelligent and accomplished Frenchman, first his tutor, afterward his life-long friend and most faithful minister, Monsieur König, commonly known as König Bey. A general illumination of the cities of Cairo and of Alexandria, in which both native and foreign residents participated, testified the public sentiment at the change of rulers, and the deliverance of the country from the tyrannical and fanatical rule under which it had groaned for several years. In the accession of Said Pacha the whole population recognized the dawn of a brighter day, and a restoration of peace and prosperity; and the hope was more than realized, though he died early in the prime of manhood, yet not before he had given a fresh impulse to the civilization and to the moral and material prosperity of Egypt.

The traveler, approaching Egypt by steamer, first sees a long low line of sandy shore, with a few hillocks covered with wind-mills, whose white wings keep fluttering and flashing against the clear blue sky. The city of Alexandria seems squatted down, like a Turk on his divan, and the minarets and domes of its mosques, and roofs of its flat-topped houses, are not visible until a very near approach to the harbor. The world-renowned Pompey's Pillar is the first object seen from sea inland, towering in air from its elevated outlook; and a little later Cleopatra's Needle, the forts and the lighthouse, break on the sight. The stranger's eye, roving around to catch the peculiarities of his first Eastern view, can find nothing else to rest upon which strikes it as strange or new, until on rounding a point, and entering the crescent-shaped harbor, a stately palace of marble rises suddenly in view, and, like Byron at Venice,

"He sees from out the wave its structures rise
As though by stroke of an enchanter's wand."

This is the palace of *Ras el Tin* ("Cape of Figs"), one of the show palaces of Egypt—the favorite summer residence of Mehemet Ali, in the days of his glory and decline, carefully shunned by his grandson and successor Abbas, but again made a favorite resort in the early part of his reign by Said Pacha. For as in all

things Said Pacha was and sought to be the opposite of Abbas, so in his residence, as in his tastes, habits, and policy, he sought to mark that opposition. As Abbas had ever made his favorite haunts in the desert, remote from cities or the habitations of man, save the prowling Bedouin whose tent is a movable home, so Said Pacha chose as his chief resort those of his palaces most in public view, and passed his days in the full gaze of publicity, as his predecessor had shunned it. The palace of *Ras el Tin*, commanding the view both of the blue waters of the Mediterranean and of the city of Alexandria, was at first his chief residence; and sitting in his audience-room, at the extremity of a long range of splendidly furnished apartments, he was at all times as accessible to the natives and to the European as ever was Mehemet Ali.

In reversal of his predecessor's policy also, Said encouraged European immigration to Egypt, and surrounded himself with European employés in the various administrations—chiefly French and English, but not to the exclusion of other nationalities—and by removing many of the restrictions on commerce imposed by Abbas, gave a new impulse both to the agriculture and the trade of the country. In fact, he may be said to have initiated a new era for Egypt, and to have made the second step in its revival, as his great father had made the first. What Mehemet Ali created, Said perfected; while under Abbas the movement was retrograde, and Egypt experienced a relapse in the direction of barbarism and the stubborn *passivism* of Turkish government.

Abbas may be regarded, in the Egyptian line, what the Emperor Julian (surnamed the Apostate) was in the Roman, for what the last sought to do for Paganism, the first strove to accomplish for Islamism; and the failure of both was equally signal. Yet the contrast is unjust to Julian, who was a man of high culture, strong intellect, and spotless private life; in all which points his unconscious Egyptian imitator was deficient.

In imitation of his great father, Said Pacha at first courted publicity, gave open audience to all who sought him, and was more easy of access than European monarchs—not to mention the Sultan, who is almost hermetically sealed up in his harem or palaces, and only visible to the eyes of "the Faithful" when he rides to mosque on Friday.

The etiquette of Stamboul is, that the Sultan, except on the occasion of public reception of ambassadors, should be always alone; isolation is the price of his grandeur, and no one is deemed so nearly equal to the "Head of the Faith" as to be worthy of his association. Abbas had sought to imitate the Stamboul régime. Said swept all those cobwebs away with the besom of a reformer, and adopted the habitudes as well as the ceremonials of the European courts in that which he established. For he introduced the plan of giving festivities on a most princely scale, including both his own

pachas, beys, and high officials, as well as prominent Europeans, and the foreign consuls-general and consular corps, in his hospitalities. The gates of the palace of Ras el Tin, at this early period of his reign, were ever open, though guarded by soldiers, and with a strong force of his mounted body-guard always on duty, more as a pageant, however, than a protection. Through those gates the visitor passed up a broad flight of stone steps into a lofty hall, paved with squares of tessellated marble, with a high glass dome throwing down light from above. Through this hall he passed into an ante-room, the first of a long suit of splendidly-furnished apartments, presenting a long vista of lamps, divans covered with rich silk brocades, and a mélange of Eastern and Western furniture—all of the costliest kinds. He who has visited Versailles, and looked down the long range of apartments leading to the ball-room there, may imagine this, its Eastern counterpart, only that the latter presented far the most brilliant *coup-d'œil*, and boasted the richest and costliest furniture, with the Oriental tinge.

The floors of the grand reception-room were composed of squares of cedar inlaid with ivory or pearl, the effect of which was very beautiful, almost pictorial. Long narrow strips of Persian carpeting indicated the pathway across from room to room, and Persian rugs were placed before each divan, or rather sofa, for the furniture was more European than Eastern. Another variation from Eastern habits was observable in the portraits of Mehemet Ali and the different members of his family, which hung round the reception-room—the pictorial representation of the human face being considered irreligious by strict Mussulmans.

In the room adjoining the inner reception-room was a small chamber, in which Mehemet Ali used to sleep. In it was to be seen the state bed, ordered from Paris, supported on massive silver pillars eight feet high, and as thick as a man's leg—a mere show-bed, however—covered with rich damask embroidered in gold, on which neither he, nor any one else probably, ever slept, since Mehemet Ali always, from early habit, slept on the floor, in true Turkish fashion, and Said preferred a less stately and more comfortable French bed, being luxurious in his personal habits, having been born prince.

In the ante-room the visitor found one of the ushers, splendidly dressed in Oriental costume, his jacket stiff with gold embroidery, who took his name, and informed him whether the Viceroy was then giving public reception or not. If already known to the Viceroy, or having any business, or even a petition to present, another official was consulted, who, after hearing the stranger's name and the object of his visit, inquired the Viceroy's pleasure thereon, and generally admitted the visitor to the presence of Said himself, preceding and announcing him. None but the consuls-general or the

consuls were invited to sit in the Viceroy's presence. The visitor on entering made his obeisance by saluting either in Eastern or in Frank fashion, stood still, and awaited the Viceroy's request that he would explain the object of his visit. He usually found the Viceroy attended by half a dozen of the officers of his court, all in bright blue jackets embroidered in gold—the Viceroy sitting in Turkish fashion on his divan, also in Oriental dress, the red fez cap on his head; some of his high officials standing on each side of him with fans to keep off the flies from his august countenance.

The stranger, who had fancied a Turk must be almost a black man, modeled on the popular representation of the Moor that Shakspeare drew, was ever surprised to see in this Egyptian Viceroy a counterpart of the portraits of Henry VIII. of England, in complexion, beard, face, and figure; and the similarity in character, manner, and temper was equally striking; though in many respects, especially in its moral aspects, the advantage was on the side of the Turk, who in every thing but creed was much the better practical Christian of the two, even as regarded multiplicity of wives.

Said Pacha was of a fair, ruddy complexion, with red beard and hair, the latter of which was always shaven in Turkish fashion. His features were regular, and the expression of his face frank and noble, his figure symmetrical, though on a grand scale, and indicating immense strength, until increasing corpulence marred both face and figure in later years. His eyes were clear and bright, and, unlike most Turks, he did not keep them habitually half closed, and avoid a direct glance at his interlocutor, but looked straight into the face of the person with whom he conversed.

Those eyes had none of the lazy languor of the Turk, but flashed with fun, or blazed with anger, as the varying mood of his excitable temper moved him. His conversational power and readiness of repartee were entirely French, and indicated the training and culture he had received. He was one of the readiest men I have ever conversed with, when his mind was at ease and in a good mood. Liberal to prodigality, generous to a fault, and full of warm impulses, his confidence was abused and his liberality preyed upon, until, like all princes, he was taught to distrust and scorn the mass of those surrounding him, who fawned on and flattered, only to deceive and plunder him. But, after a long and intimate acquaintance with him, without being blind to his faults, I can say with truth that, in a widely varied experience of men and countries, I have met with no nobler and more generous nature than his, warped as it may have been in his latter days, and soured by the ingratitude and the treachery of those on whom he lavished favors. In his early prime, before he had tasted the bitters as well as the sweets of power and absolute rule, he was a model monarch, as well as a truly noble man, in mind and manner as well as personal

presence. He spoke French like a Parisian, understood English and Italian, and of course was a Turkish and Arabic scholar—the Turkish being the high court language of Egypt, as well as of Constantinople, with his own people, though the French was the court language for conference with or dispatches to the foreign agents, and that used in their diplomatic communications to each other. The language, however, used in judicial proceedings in the consulates, where courts were held regularly for the trial of civil and criminal causes, was the Italian—many advocates of that nation having lucrative practice at Alexandria.

I have described the informal audiences given by the Viceroy. The formal receptions on the arrival and reception of a new consul-general, or on the occasion of some public ceremony or fête, were very imposing, and would compare favorably with those even in France under Napoleon III., relatively speaking. Thus, when the Viceroy conceived the idea of founding a city at the point on the Nile where it is spanned by the magnificent Barrage, or break-water of the Nile, which cost three or four millions of pounds to construct—commenced by Mehemet Ali, and continued, though never quite completed, by his successors—he made a grand fête, which I shall briefly describe.

All the agents of foreign governments, all the leading European merchants, were invited, and all the leading pachas and beys were commanded to come to this fête, which was to continue for three days and nights. The consular corps, and some of his friends, were invited to be the guests of the Viceroy; and on coming up the river in their *dahabiehs*, or Nile boats, found tents prepared for their accommodation, and obsequious officials, who had orders to supply them three times a day with an abundance of food, and of choice wines of every quality as well. These stewards came regularly to take down in writing their requisitions, and provide without stint or limit for the consuls-general and their numerous suits and friendly visitors.

The Viceroy himself occupied a magnificent tent, where at stated hours he received visitors and entertained them. Booths were erected, in which all day and all night might be witnessed the feats of the jugglers and the dancing women of the country; and the droning chant of the singing girls, accompanied by the monotonous music of the *darabuka* (fish-skin drum), the ear-piercing squeaks of the reed fife, or the tum-tum of the *raab*, or native guitar, rose up, “most musical and melancholy,” upon the air. Feats of horsemanship, and the mimic tournament, in which the Arab horsemen hurl the reed at each other, and exhibit their marvelous skill, equaled only by our Comanche Indians, whom they closely resemble in appearance, were also going on incessantly on an open plain near by, in the midst of clouds of dust under those rainless skies; and the beggars on horseback, such as Solomon saw, in the person of

the ragged Bedouins, mounted on priceless horses, and clad in one priceless garment also, in another sense, performed feats such as no circus ever displayed on its sawdust arena. At night, brilliant displays of those matchless Eastern fire-works lit up the scene; and we sat smoking and sipping coffee and sherbets in the grand tent of the Viceroy, and looking out on the bright, fiery meteors of the show, or turning our eyes upward to the bright, unwinking, lustrous lamps hung high in the Eastern heaven, from whose clear dome of azure hangs not down one single cloud to obstruct those starry splendors from planets large and luminous as lesser moons.

The tents were pitched near the river, and on our return to our *dahabiehs*, on which we slept, as more comfortable than the tents, we would be soothed to slumber by the monotonous murmur of old Father Nile, as he rolled placidly down, whispering among his reeds; to be at sunrise awakened by the martial music which the Viceroy loved, and which sounded the reveille at that fresh and balmy hour. In the East people retire early to rest, and rise early in the morning, and those that are not matutinal elsewhere find it to their advantage to be so in the East; for the most pleasant and the freshest hours of the day are those between daybreak and 9 A.M., before the sun has asserted his full dominion over the land, on which he bestows his most continuous smile.

Said Pacha was much possessed by a military mania; he loved “the pomp and circumstance of glorious war,” and its parade as well, and paid very great attention to the recruiting, drill, and equipment of his soldiers. He largely increased the number of his army, and greatly improved its personnel and discipline also; and in addition to his regular force of some thirty or forty thousand men in baggy breeches and jackets of white with metal buttons, he had also several fancy troops of horse, equipped in costumes adopted from former days. One of the most striking of these troops was one of gigantic Nubians, clad from head to heel in chain armor, and their black Dongola barbs as well, in imitation of the old Crusaders; a grim troop they looked with their jet black barbs and jet black faces, with rolling white eyes and rattling chain armor! Another troop had on bright brass helmets, and shone afar off in glittering breast and back plates of the same metal; and it seemed only by a special mercy of Allah that every man of them had not perished by sun-stroke in that burning clime. Yet the Crusaders survived a similar trial, and they were not “to the manner born,” nor bred up in those fervid climes; so our African friends doubtless did not need our sympathies.

And so for three days and nights this royal revel went on—hundreds of thousands of people flocking to the spot day after day, of all colors, creeds, and every variety of picturesque rag-coverings—the open hand of the Viceroy distributing abundant food to all comers, and a

cloud of smoke from nargileh and chibouque rising up from the spot, like incense from an altar, all the time; for every man, however poor, had his pipe of some kind, and the tobacco to burn in it, that being the Eastern man's first and greatest want, beyond even food or clothes—the one indispensable thing, his substitute for the American “mixed drink,” for he drinks water only, by the Prophet's command and his own simple taste.

And then the Viceroy's tents were struck, the martial music sounded; accompanied by his army he moved on to Cairo, twenty miles distant, and the motley crowd which had made a temporary city in the sandy solitude melted away from the spot, leaving scarcely a trace behind of the busy and crowded scene and thronging multitudes that had made brief holiday there and caused the desert to blossom as the rose.

Just before departing the Viceroy invited all the consuls-general of the Great Powers to his tent to take congé, and, after the usual compliments, pipes, and coffee, presented each a large silver medal, which he had caused to be struck off at the royal mint in commemoration of the festival and the founding of the new city, as a souvenir of the event. This medal was about six inches in circumference; on the one side was a plan of the Barrage; on the reverse an inscription in Arabic, setting forth the fact that on that date Said Pasha had laid the foundation-stone of the new city.

To the best of my knowledge and belief the projected city was soon abandoned, and its corner-stone, laid by Said, may represent one of those proverbial stones which are said to pave the lower regions; the pageant described was the most substantial thing about the enterprise.

But he gave more formal entertainments still, quite in defiance of old Turkish prejudices and usages. He gave great public dinners at his palaces, to which he invited as many as five hundred guests, of all nationalities.

At the end of the great hall would be a raised table, at which the Viceroy and the consuls-general sat alone, with a few of his highest and most favored Egyptian officials, such as his Minister of War and of Foreign Affairs—for he had regular Cabinet officers at the head of each branch of administration, some of whom were Armenian Christians, some French and English renegades, and others Turks, but seldom native Egyptians.

At this higher table the entire service at every remove was of gold—plates, forks, spoons—no baser metal was used or allowed to appear—and the candelabra were of the same precious metal. The dinners were served in the Frank style altogether. Stretching down below, on a lower level, was the long table at which the other guests were seated, to the number of several hundred—European alternating with native—the contrast in costume and appearance being very striking. At the right hand of each European were placed bottles of wine—none near the natives, who did not drink, in public at least,

except in some rare instances. The Viceroy himself enjoyed French cookery, and did not stint Champagne. Many Turks drink ale and Champagne, insisting that the Prophet forbade the use only of “nebeet,” or red wine; and in the Holy Scriptures the reader will remember the injunction, “Look not upon the wine when it is red,” which certainly seems to give color to the Mussulman gloss upon the text of the Koran.

The Babel of languages at these feasts may be imagined; but Said Pasha was really a good entertainer, and an equally good conversationalist, and seemed highly to enjoy these feasts, which were served up in regular French style, and prepared by admirable French cooks.

These state dinners were given chiefly at his palace at Cairo, situated on the bank of the Nile; and the harem apartments, where dwelt the Princess (the Sitta Khaum) and her women, formed a wing of that palace. It was the custom of this favorite wife of Said Pasha, who took the rank and assumed the state of a queen, to invite the wives of the consuls-general to dine with her at the same time; and I have been told that while our banquets were going on bright eyes were watching the scene from a lattice above, where the Princess and her fair visitors could see without being seen, and freely criticise the men and things below.

Although the Mussulman law legalizes the possession of four wives at a time, and custom sanctions the addition of as many “hand-maids” as the happy proprietor may choose to purchase, the children of whom are liberally allowed to be considered legitimate, yet there is always one acknowledged head of the house—the favorite wife for the time being. In the Viceroy's household this favored one is termed the “Sitta Khaum,” or great lady—the same title given the princesses of the blood royal—and she is queen of the country, and never displaced, even though she fail in what in the East is regarded the one great duty of woman, and bears her lord no children. Such was the case with the wife of Said Pasha, who never bore him children—his only son being the issue of a Circassian slave, who was promoted to the rank next to that of the Princess for having given him an heir. The Princess herself was said to be a lovely woman, both in face and figure, and her character and intelligence were exceptionally high. She was a poetess and a musician also, but spoke or understood no European language. It is scarcely necessary to add that, with the exception of these invited ladies above, no women figured at these vice-regal fêtes, the separation of the sexes still continuing complete in Egypt in spite of the reforms and the innovations introduced in that kingdom. Alone of all Mussulmans the Sultan is interdicted from marriage. He can only have mistresses, who, nevertheless, are designated by the title of princesses, and take rank as first, second, and third, and so on; and all his children are regarded as legitimate. Every other son of Islam is by law allowed four legal wives, and an

unlimited number of female slaves, as his caprice or his means may dictate. This exclusion of the Sultan from contracting the rite of matrimony arises from the idea of his superiority to all inferior human beings, after he has been invested with the authority of "head of the faith." He is the spiritual as well as the temporal head of Islam, just as to a lesser degree the Czar of Russia is to the Greek Christian Church.

The Egyptian viceroys not claiming to possess this spiritual function, occupy a lower grade; and it was an affectation in Stamboul for the Sublime Porte, in all communications to its Egyptian vassal, to style him only "Governor-General of Egypt," not Viceroy; until very recently Ismail Pacha, the reigning Viceroy, by a mighty bribe bought the title equivalent to that of king, and obtained a change in the succession in favor of his son from the reigning Sultan, Abdul Aziz.

Said Pacha intrigued much and spent large sums of money at Constantinople to achieve the same results; but either his liberality or the wants of the Sultan were not then so great, and he expended vast sums and made magnificent presents to be repaid only by empty promises, which kept alive while they mocked his hopes.

His son Toussoun, a very pretty and intelligent boy, he was very fond of; and I have often seen him evince much paternal pride in talking with or of him. He was not a debauched or a dissolute man in his habits, and set an example in his domestic life to his pachas and subjects, which, I regret to say, few of them followed; since licentiousness is usually the rule, not the exception, in the East; screened, however, from public gaze by the impenetrable privacy of Oriental life, to which the closely-veiled harem affords its convenient screen.

In public affairs he was as busy as in entertainments. He relaxed many of the restrictions on foreign commerce which the narrow-minded Abbas had imposed; he revised the oppressive system of taxation which ground the faces of the laboring poor, and never plundered the rich; he checked abuses in the administration of justice, and punished unjust judges, or the oppressing pachas in the provinces, when he detected them. He relieved the fellah, or agricultural laborer, from the exactions and imposts levied on him by his predecessor. He went further, and raised to the dignity of independent laborers these fellahs, before treated only as

"The mass of bones and muscles,
Framed to till the soil a few brief years,
Then rot unnamed beneath it,"

by allowing them to become proprietors as well as tillers of the soil. This was the first step made in the direction of the emancipation of this class—slaves in every thing but name—who were not allowed even to change their residence from one village to another without special permission, rarely granted; and who were forced into military service by a process similar to the impressment of sailors formerly practiced in En-

gland. I have often passed on the road, in the time of Abbas, numbers of these fellahs driven along by soldiers, and seen them chained together, with a heavy log of wood depending from the chain, just impressed for the army.

Said Pacha adopted a system of regular recruiting, and gave regular pay to his soldiers, permitting them to return home after their three years' conscription had expired. He also allowed the fellahs to become land-owners, and did for them fully as much, if not more, than the Czar of Russia did for his serfs, whose condition was very similar to theirs. He made strenuous efforts, also, to abolish the slave-trade from the interior and the Red Sea in negro slaves; but it must be admitted that, in several instances which fell within my own knowledge, when he had confiscated a cargo of these "contrabands" he converted the males into involuntary recruits for his army, and sent the females into service in the harems—which, however, they doubtless preferred to returning to their own homes, to be kidnapped and sold again by their affectionate parents.

The "man and brother," as well as the sister, has a hard time of it in the family circle in Ethiopia, Abyssinia, or Nubia, and is ever reluctant to return home when the choice is allowed. And here it may not be amiss to say one word in relation to the great point in which Eastern slavery differs from that "institution" as it had been established in the West, and still languishingly lives in Cuba and Brazil, after its abolition in the United States.

The negro in the East is entirely a domestic, not an agricultural laborer; he is employed exclusively in the house, not in the fields, and is petted and pampered, and has generally a very easy time of it. With the exception of the unhappy class who are made the guardians of the harems, and who are comparatively few in number, they are made pipe-bearers, body servants, or house servants, and well clad and cared for, and grow sleek, fat, and insolent. The agricultural laborers, as before stated, are the fellahs or native peasants, who are copper-colored, not black, and who neither in feature nor physical or mental conformation resemble the negro. The slavery in Egypt was never dependent on caste or color; for a female Greek slave, formerly purchased for a small sum at Alexandria, is now the wife of a well-known French ambassador, and a queen of fashion in one of the most brilliant European courts. A slave, too, was the mother of Said himself, but she was a Circassian woman; and slavery in the East, to this day, fills the houses and improves the population of the great cities by the infusion of the fresh Georgian and Circassian blood into the withered trunk of Islam, like new sap causing the old tree to bloom and blossom again with renewed life. The negro in Africa is the same thoughtless creature, the same grown-up child that he is here; and although no barrier of race or color is regarded as a bar to promotion in the East, yet the high-

est positions he is generally found filling there are in the guardianship of the harem and in domestic service, or as a common soldier. In all my long Eastern experience I never saw the genuine negro filling any high position in the state—for the Abyssinian is not a negro, either in features or configuration of head or form. Whether any of this race are members of the "Parliament" Ismail Pacha has lately convoked in imitation of European forms I do not know, but think it improbable from my previous experience.

By one of those curious inconsistencies which characterize human nature every where, Abbas, while trying to revive the old spirit of Islam, and keep up old Eastern usages as opposed to European, allowed his officials, if it pleased them, to wear the Stamboul or Frank dress, and had his soldiers also arrayed in a mongrel Frank costume called the Nizam.

Said Pacha, who took the opposite policy, strictly enforced the adoption of the Eastern costume in his court, wore it habitually himself, and put all his soldiers in baggy breeches as well. He attempted to establish, and vehemently asserted, an Egyptian nationality as contradistinguished from the Turkish or the European; and even the European merchants, who sought to play the courtier with him, had to wear the red fez cap when visiting him. This was carried so far that I have even seen the consuls of some of the smaller Powers, who were merchants and speculators as well, adopt the same badge in true courtier-like style; for, of all symbols in the East, the hat—the unsuggestive stove-pipe hat we wear—is the unmistakable emblem of the European and the Christian—the badge of the alien in race and religion.

Every one knows how picturesque and graceful the Eastern costume is, with its loose, flowing folds, its bright colors, its rich embroidery, its soft shawls and red tarboosh, relieved by the takea or inner skull-cap of snowy whiteness. Added to these the jewel-hilted Damascus cimeter suspended by its silken cord, and the Eastern cavalier may well deride the costume of the Frank, which, though in his court suit stiff with gold embroidery, makes the wearer look lean, angular, and undignified in its tight and straitened proportions and meagre outline.

I have witnessed the galas and participated in the ceremonials of European courts, but they present a sorry show when compared with similar pageants in the East; and not even the Tuileries can vie with some of those receptions given by the Egyptian Viceroy in the palace on the Nile, either in the dazzling splendor of the halls of reception within, or the reflected light of innumerable colored lamps without, which illuminated the river on the one side, and the gardens, faint with the perfume of exotics, on the other; and when you entered those halls of dazzling light, and saw the Viceroy in his rich robes of state, glittering with gems and costly stones, from the aigrette of diamonds

worth a king's ransom on his red tarboosh, down to the great ruby which glowed like fire on his finger, with the port and presence of one born to rule, you could not but admit that he looked every inch a king. Ranged beside him were his pachas, beys, generals, and ministers—all richly, nay, gorgeously attired, also in Eastern costumes, stiff with cloth of gold, while the European agents, in their uniforms richly embroidered also, with court-swords at their sides, gave the charm of contrast to the scene.

At intervals bright rockets would shoot up into the sky from the water or the gardens, and suddenly bright and continuous displays of fire-works would be made. On one occasion I remember a representation of the destruction of Pompeii was planned by an ambitious Greek pyrotechnist, and a mimic town was built up to be destroyed—the representation in the open air lasting full two hours, and consuming not only the wood of which the model city was constructed, but a very large amount of the Viceroy's gold also. The lucky artist laid the foundation of a large fortune on the ashes of this second Pompeii. But ordinarily the fire-works were not on so elaborate a scale, although superior to those which excite our admiration in Europe or America.

From the river and from the gardens floated in the melodious strains of the European bands, whose music the Viceroy had the taste to prefer to the native music, though ever and anon the wild, monotonous beat of the darabuka, accompanied by the chanting song of the native minstrels, might also be heard from the caugia or dahabieh passing up or down river, reminding the listener that these revels were being held on the banks of that river which is older than history.

To the stranger within those hospitable gates, gazing in mingled admiration and wonder on this brilliant scene, and fancying almost that it was an Aladdin's hall in which he stood, suddenly to dissolve like a dream and fade away, leaving no wreck behind, one want was felt, one void experienced. It was, indeed, almost like an Eastern vision within, and a primitive paradise without; but the wanderer from other lands, while gazing upon all these wondrous things so new and so lovely to him, felt there was one thing wanting to complete it—even as did old Father Adam before he found his Eve. There was no woman there—that refining and softening influence was not visible. The soft voices, bright eyes, and lovely faces and forms, which elsewhere would have added sweeter music, softer light, and more soul-subduing influences, this great prince, with all his power, dare not summon to grace his festival.

Eastern etiquette and inexorable custom, stronger than written laws, more potential than princes, forbade her presence in such a scene; and the enchantment was thus rendered incomplete by the absence of the sole sorceress, who can witch away the selfishness of the sterner sex, and make them for a while, by her fascina-

tion, forget themselves. This is the salient peculiarity of all Eastern fêtes to the Western man, and in consequence of that omission the amusements of the guests are greatly restricted—since there can neither be dancing as at our balls, music and singing as at *soirées musicales*, nor any pleasure in—

“A seat on a silken sofa
By the light of a chandelier,”

when a bearded visage and manly form occupy the place beside you, and the whispers indulged in are of intrigues unallied to love.

I can recall but one exception to this exclusion of the fairer half of creation, and I remember well the novel excitement which was afforded at one of these entertainments by the introduction of the new element of female presence in our midst, under these circumstances.

The Viceroy and some of the consuls-general were sitting together on a small balcony of the palace witnessing the fire-works, and the outer crowd of spectators was very dense, pressing up to the steps. In the very front of the crowd was the unusual apparition of several European women, dressed in their traveling costumes, and escorted by their male companions, in wide-awake hats, shooting-jackets, and the dust-stained garments of Oriental travel. One of the ladies was recognized by one of the consuls-general, who bowed and spoke to her. The Viceroy, turning to him quickly, said: “One of your compatriots—one of your friends!—invite her and her companions in. The sight may amuse them.” The expression of the Viceroy’s wish was a command. The consul-general could only obey the courteous mandate, though much confused at the *contretemps*.

The fair invaders, nothing loth, promptly accepted the invitation, entered the palace, and strolled through the bright scene, affording a curious contrast, in their dusty dresses and general *deshabille*, to all that surrounded them. The incident seemed greatly to amuse the Pacha, but he evidently formed a low estimate of both the beauty and the modesty of the intrepid dames who thus trampled on Eastern prejudices and vice-regal etiquette.

The toleration accorded by the Viceroy to this daring sally was not shared in by the crowd of spectators outside, who indulged in loud comments, happily not intelligible to the intrepid damsels or their escort, because couched in the Arabic tongue, but not over-flattering in their import.

The ears of the fair ones would have tingled, and the hands of their male companions would have clenched, with a contraction of the fist and extension of the arm, had they only comprehended the popular appreciation of the unveiled women who thus obtruded themselves on an assemblage of men. Ignorance certainly is bliss sometimes, and it emphatically was so in this case.

The higher classes in the East also have ac-

quired a great taste for gambling, and play cards with great gusto, and for heavy stakes. At the European entertainments at Alexandria the high officials whiled away the time in this way—baggy breeches and Eastern ideas of dignity not permitting them to join in the dance—and they soon became great proficient in it. So seductive did they find this new excitement that I have seen two consuls-general and two princes of the blood royal, occupying reserved railway carriages during the transit from Alexandria to Cairo, which takes six hours, improvise a card-table by placing the cushions of the seat on their knees, and exchange four thousand Napoleons during the transit. But no such diversion was allowed at the Viceroy’s fêtes, nor any preparation made for it, in which respect the balls of the Tuileries, to which his have been likened, offer superior inducements, for there is always a card-room there for the benefit of the old fogies or inveterate gamblers.

At the Viceroy’s entertainments, again, there was this difference: there was no set supper to which the guests were summoned at a given hour, in the order of precedence to which their rank entitled them. All the evening attendants, bearing on silver trays cakes, sherbets, and various colored preparations which quench Oriental thirst, without vinous or alcoholic admixture, were gliding about with that noiseless, sliding step so peculiar to the Arab, among the assembled guests. For those who sought grosser refreshments there were long canvas-covered tents in the garden, where on a long table was spread out a set supper of solid food, eternally replenished, where the most ravenous hunger might be sated. One of these tents—smaller—was reserved for the more distinguished guests and officials.

To the other entrance was free to all admitted within the gates as guests. A file of soldiers separated the spectators, always assembled in great crowds, from the invited guests, and beyond a certain line the former were not allowed to pass, although they too were permitted to finish the relics of the feast, after the invited guests had departed.

Mention has already been made of the encouragement given by the new Viceroy to the foreigners resident in his kingdom, and his employment of them in his different administrations.

There were several classes of foreigners employed thus; the first class was composed of Europeans who had gone literally body and soul into the Egyptian service—becoming renegades, and adopting the religion and the life, as well as the costume, of the country—and these men, though few in number, obtained high rank and great influence, accumulated large fortunes, dressed, looked, and lived like Turks in all respects, including the harem privileges.

The second class were tempted either by love of adventure or high pay into the Egyptian service, military or civil; but this second class never made so good a thing of it as the rene-

gades, and considered themselves only as temporary residents in Egypt, for the accumulation of wealth sufficient to return home again. This second class was composed chiefly of civil engineers, railroad and telegraph employés, and men like Mariette Bey, who supervised the excavations among the old monuments, prepared the Egyptian Museum of Curiosities founded by Said Pacha.

A third class were the foreign political refugees, whom the storms of 1848 had swept out of Europe. Many of these were men of high birth and culture, such as the Italian Count Galeozzo, Vicomte of Milan, and other Italian, Hungarian, Polish, Austrian, and Venetian refugees. The Chevalier Lattis, of Venice, who, with Manin, was one of the triumvirate of the short-lived Venetian Republic, was one of these exiles. These men, with rare exceptions, did not renounce their religion as well as their allegiance on entering the Egyptian service, and therefore did not rise so high. Many of them have drifted back to Europe since the popular flood-tide has set in there again, and resumed their old places and possessions at home. Nearly all these political refugees were under the protection of the American Consul-General, Mr. De Leon, whose influence with Said Pacha was largely and successfully exerted for them.

A fourth class still of the new employés was to be found among the native Christians—Rayahs, as they are termed—of Greek, Armenian, Coptic, and Syrian blood, belonging to the Greek Christian Church, but born subjects of the Viceroy. These Rayahs, pillaged and persecuted and excluded from position by the bigoted Abbas—whose faith was very much of the Puritan stamp, and exhibited itself in “tender mercies” like those of our “Pilgrim Fathers”—were kindly treated by his more liberal successor, and advanced to high positions.

Thus he made Arakel Bey, an Armenian Christian, Governor of the Soudan—a post second only to his own in power and pay; and his brother, Nubazo, he created a pacha, and made actually his Prime Minister, intrusting all delicate European negotiations to him, as in the case of the Suez Canal controversy at a later period.

Before briefly sketching the strange and romantic stories of some of the most prominent of these European renegades, let us look for a moment at a European who, though a life-long employé in confidential positions in Egypt, and styled a bey, as well as holding the important post of High-Chamberlain at court, and Introducer of Embassadors, yet lived and died a devout Catholic, and an incorruptible man in the midst of corruption. If the poet's dictum be true, that an honest man's the noblest work of God, then may we apply that high estimate to König Bey, first tutor to Said Pacha in his youth, and afterward his faithful friend, counselor, and servant, until death divided them, though he survived his friend and monarch only a few short months. The friendship be-

tween the pupil and the tutor, and which lasted with life, was equally honorable to both; for König Bey, though a man of polished manners and great urbanity of address, was no cringing courtier, but preserved his own manly self-respect toward the Viceroy, even as he had with his prince-pupil—treated the full-grown African lion, after his teeth and claws were fully grown, even as he had the playful young lion's whelp. On the other side, although the enjoyment of unrestrained and unbounded power and wealth wrought great changes in Said Pacha's character, yet he never changed in his treatment of König Bey, who was kept near his person in a high position, and presented with property of considerable value. The intimate relations and influence he enjoyed his former tutor and late confidant used or abused so little that, while all the other employés near the Viceroy grew enormously rich, he left only a modest competency to his family after his death, which followed shortly after the Viceroy's.

The foreign adventurers in Egypt, as a class, were generally so unscrupulous, and so utterly selfish, that a shining example, like that of König Bey, to the contrary, is well worthy of record. Truth compels me to say that I found very few like him among his own compatriots, or the other European attachés to the Egyptian Government. As before remarked, the history of some of these men was very romantic, and worthy of a few words in passing, for their influence in Egypt did much to mould and shape the administration into form.

A remarkable and prominent instance of this was the case of Suleyman Pacha, General-in-Chief of the Egyptian army under the administration of Said Pacha. He was a Frenchman by birth, and held the rank of Colonel under Napoleon I., and was then known as Colonel Sevés. Attached to the French invasion of Egypt in that capacity, when the French occupation ceased, and the army evacuated the country, he resigned his commission, or at any rate remained in Egypt, became a Mussulman, and, like Byron's hero in the “Siege of Corinth,”

“The turban girt his shaven brow.”

The change diminished his license in the way of wine, and increased it in the way of wives; for he rigorously conformed to all the Mussulman rights and usages to the day of his death, which only anticipated Said's by a short period, and his name is embalmed in Mussulman memory as that of one who died “a true believer.”

I knew Suleyman Pacha very well, and a more thorough Turk in appearance, habits, and manner it was impossible to see. But the native French vivacity was irrepressible in his conversation, and when he became excited in argument you recognized the influence of the Boulevards and of the Champs Elysées, as well as the days of the Empire.

On the latter topic, however, I never heard him speak; nor did he ever, when I was pres-

ent, refer to his European souvenirs. He avoided European society as much as he could, and when forced into it by his official position his reticence and reserve were truly Oriental. No stranger seeing the dignified looking old man, with his Oriental costume, snowy beard falling on his breast, and grave, composed manner, could have doubted that he was looking on a high-bred Turk of the old régime; but one who knew his history, and watched him closely, could observe an occasional impatient twitching of the mouth under the heavy mustache, and a flash of the steel-gray eye, which betrayed the excited Gaul masquerading under the Oriental dress and manner, the hot blood which even age could not cool, the fiery temper which even habit could not school, and the French frivolity under the Turkish phlegm.

He was a good soldier and a stern martinet, and both in the matter of drill and equipment improved the efficiency of the Egyptian army, and caused it to make a very creditable display on the occasion of the great reviews. Said was so fond of having—often taking his whole army on a military promenade, and living himself under tents with them for weeks at a time, which, in a climate like that of Egypt, was by no means as disagreeable as under colder and more inclement skies. So, to the best of my knowledge, like Alp, old Suleyman Pacha died, as he had lived,

“Without a hope from mercy’s aid,
Still to the last a renegade”—

probably sharing the easy indifference about religions of all kinds which characterized the first Napoleon, who was Philosopher at Paris, most Catholic at Rome, and a good Mussulman at Cairo.

Another of the most conspicuous of the newly made true believers was Abdallah Pacha, an Englishman by birth, whose aspiration of his *kis*, when he condescended to speak his native tongue in private, indicated his origin most unmistakably. He was one of the most imposing-looking Turks the foreign tourists ever saw, and his imperturbable gravity and self-control were something to marvel at to those who knew his history. As head of the transit through Egypt by railway, an office of great responsibility, he was constantly brought in contact with the tourists and passengers from India and England, and had to listen to and decide upon their complaints and requisitions, which were neither few nor unfrequent. But he spoke no language but Arabic, and had always his interpreter standing by his side to render into that language all that was said, and his own replies. Frequently have I seen him sitting unmoved, and apparently understanding nothing that was said, his Eastern costume and bushy red beard flowing on his breast, calmly smoking his chibouque, while a crowd of angry Englishmen from India, or on their way thither, were uttering their complaints in language most uncomplimentary to the Viceroy

and the imperturbable Abdallah, who they little dreamed comprehended their very emphatic Anglo-Saxon.

“Tell the old Turkish beggar so and so!” “Ask the lazy old Turk to stop making a chimney of himself and attend to his business here, or our Consul-General will have him turned out of his place!” and other such flattering speeches would fall on his unheeding ear, and all the while he would be gravely conversing, with Eastern formality, through his interpreter; though I could sometimes catch a gleam of amusement in his eye when he saw one present who knew the farce he was playing. In private life there was no humbug about him, and his characteristics were very English. He was a bold, bluff, energetic man, despotic to his inferiors, but cordial to his equals, and very proud of his rank and position in the service, which he turned to his profit. He was free enough in his conversation with the few foreigners he associated with, but entertained only in the Eastern fashion, conforming in all respects to the custom of the country and the injunctions of his new religion, whose mandates he scrupulously observed, as well as its social system. He drank no wine, ate no pork, had his harem, and never made or encouraged any allusion to religious topics. He still lives, and is not an old man. Not having enjoyed any early advantages of education or society, this reticence, and the self-respect which prompted it, proves him to have been naturally a man of strong intellect and sound judgment. He was very little of a courtier, and the bluntness with which he ever expressed his opinions, even to his patron the Viceroy, showed that the seeds of his English nature still germinated under his shaven brow. Curious, indeed, was it to witness this sturdy English oak metamorphosed into an Egyptian palm; but its fruit was ever the acorn, though its foliage might cause it to be mistaken for the Eastern tree. There were a great many others whose histories were equally curious, but fearing to fatigue the reader, I reserve them for the present, thinking these two specimens of Orientalized Frenchman and Englishman may serve as samples of the whole.

Recruiting his administration by fresh blood, native and exotic, Said Pacha evoked order out of the Egyptian chaos, and both private and public interests improved and prospered by the change. Not only were the agricultural products immensely increased by the wise step of giving the laborer an interest in the soil, and assuring him of the enjoyment of the fruits of his labor, but the introduction of all the European improvements in agricultural implements, steam-plows, and steam-pumps to force up the water from the Nile—now no longer permitted to overflow its banks—assisted in this development. Commerce, too, was immensely stimulated by the influx of European immigration, and the protection and encouragement given to the mercantile community; and the annual revenues of Egypt, from its imports and

duties alone, rose in the time of Said to £6,000,000. The internal taxes it would be difficult to estimate, for no annual estimates were ever rendered, and taxation was proportionate to the wants of the administration and of the Viceroy, who, like Cæsar, could at any time send an edict "that all his world should be taxed," and that edict was enforced, without protest or whisper of complaint being heard.

Our own civil war was of great benefit to Egypt. Said Pacha had the sagacity to see the opening offered for Egyptian cotton, which more nearly approximates the Sea Island than any raised elsewhere, and said to the Consul-General in Egypt—a Southern man—on taking congé, "If your people stop the cotton supply for Europe, my people will have to grow more and supply them;" and his words were prophetic; for Egypt grew fat and flourished on the demand caused by that war for her cotton, of which she greatly increased the produce, and obtained very high prices for the crop during a series of years.

A tragic event, which caused the Viceroy much uneasiness, and was made the theme of scandalous suspicion, occurred at an early part of his reign. He had invited his kinsmen, the princes of the blood, his nephews, and all the high officials to a fête he was to give at Alexandria in honor of his son Toussoun. The great railway bridge over the Nile had just been completed, which works by a draw-bridge, opening at times for the passage of steamers up and down the river. Through the carelessness of some of the employés, when the special train which was conveying the princes and their suits back again to Cairo was returning, this draw-bridge was left open, the train rushed on in the obscurity of twilight, and the engineer saw, too late to stop the speed and reverse the engine, that the draw-bridge was open, and that he was driving on the train to death and destruction, as a few yards more would hurl them all sheer down into the rushing river—a fall of sixty feet. On thundered the train down the short slope that led to the bridge, and then all saw their danger—too late!

In one of the cars sat the Prince Achmet, a gross, clumsy man, nephew and next in succession to Said, with Prince Halim, one of Said's younger brothers, and much beloved by him—together with generals, courtiers, and officials. Ismail, the present Viceroy, not being on good terms with Said, had feigned sickness, and was thus providentially saved. The Prince Achmet, and all the others save one, stupefied by terror, or stubbornly relying on "kismet," or destiny—the key-stone of Eastern fatalism—sat stupidly still, and were precipitated sheer down with the carriages into the stream, whence their dead bodies were fished up by expert divers the day after the event. One man escaped—the Prince Halim—then in the flower of his youth, and noted for his skill and endurance in all manly sports. Son of a Bedouin mother, he partakes of many of the characteristics of the

race whose blood runs in his veins. Like Nimrod, a mighty hunter, and as "a tamer of horses" worthy of a place beside old Homer's heroes—with the eye of a falcon, the heart of a lion, and the sinewy and supple strength of one of his own desert steeds—he neither lost his presence of mind nor his courage. Calling on his uncle and the others to imitate him, he rose up, as the train rushed rapidly down the slope to the yawning chasm, burst open the door, and on reaching the open draw-bridge plunged headlong into the river. Those who witnessed the spectacle, and saw him sink like a stone into the swollen flood, never expected to see the daring Prince emerge alive again; but his arm, as well as his heart, was strong: he did rise again, buffeting the angry waters which had engulfed his friends, swam safely to the shore, and lives to this day in those charming gardens of Shoubra which were wont to solace the leisure of Mehemet Ali in his old age, as described in a recent number of this Magazine.

The public works of Egypt occupied much of the attention of the new Viceroy. He pushed to completion the railroad from Alexandria to Cairo, and extended it by an additional line from Cairo to Suez, replacing by steam the slow transit over the desert by vans drawn by mules, and thus giving increased facility to the travel between Europe and India. He also established the telegraph wires, extending them over all parts of Egypt, even into the interior and far up the Nile—a startling innovation in the East, for there is no other portion of the country ruled by the Ottoman race where either of these modern improvements exists, with the exception of the very short line of railway from Smyrna to Aidin, in Asia Minor. Constantinople and the realm of the Sublime Porte make their lines and their improvements on paper only. Said Pacha made his working realities. Nay, he did more: improving on an idea of Abbas, the misanthrope, toward the close of his reign, when increasing obesity and disease, finally fatal, made locomotion less easy for him, he had branch lines of his railways run up to the back-doors of his several palaces; and when badly badgered by pertinacious consuls-general seeking formal audiences, or by petitioners seeking to squeeze still more his already shrunken purse, he would quietly order his engine, which was always under steam, and incontinently elope for some other palace. Meanwhile the expectant visitor remained quietly puffing one of the amber-tipped and jeweled mouth-pieces of the host's chibouque in the reception-room, as Said was steaming away and amusing himself with the disappointment of his guest on finding the march which had been stolen upon him.

One of the greatest landmarks of his reign was the conception and commencement of the great Suez Canal project of M. Ferdinand de Lesseps, under his auspices and by his aid. I was with the Viceroy the morning M. de Lesseps first broached the matter to him, and, as

a friend of that gentleman, encouraged the idea, and represented to the Viceroy the honor which would redound to him as the patron of so grand an international work. M. de Lesseps was an old friend of the Viceroy's, having been Acting Consul-General of France at Alexandria when Said was quite a youth, himself then a young man, and familiar with the young Prince. He filled afterward the post of French Minister to Rome, in '48, and quarreled with the Provisional Government, though himself of advanced Liberal politics. On the attack on Rome by General Oudinot, which he denounced as inconsistent with the professions and policy of France, overruled, he resigned in disgust, and returned into private life. On the accession of Said, his old companion, he visited Egypt, his head and heart full of the grand project of cutting a canal through the Isthmus of Suez, and obtained the co-operation of Mougél Bey, an eminent French engineer, who had planned the Barrage across the Nile, and who was high authority in all such matters in Egypt. Encouraged by Said Pacha, who liberally patronized the scheme, both by his concession to M. de Lesseps of the privilege, as well as by very large contributions of money afterward, M. de Lesseps constituted his company, commenced the work, and the rest is known to the world; for both his name and that of the canal have already become part of the history of our time. The canal is now almost complete, and the vexed question of its utility will now soon be tested. That of its practicability, so stoutly contested by English engineers, has long since been successfully demonstrated.

Said did not live long enough to see the completion of this great work, with which his name must ever be indissolubly connected; but he lived sufficiently long to see that the experiment would be successful in which he had spent so much treasure, and which, in its different stages, had caused him so much anxiety and annoyance.

Neither he, nor M. de Lesseps, nor the Peninsular and Oriental Company of Great Britain—their great opponent at that time—while contesting the route to India for England or France, dreamed of the later route across the Pacific Ocean which American enterprise has since established from our Western slope, to tap the extreme East from that side, and draw away her richest produce from them both; for the Pacific route to China and Japan opens a new and virgin Ophir to the commercial world.

At the suggestion of the American Consul-General Said Pacha also sent to America, and obtained samples of American locomotives and railway cars and wagons, as well as steam-pumps and other American machinery.

He was so pleased with those that he afterward sent very large orders to the American engine and car builders; and Americans who have traveled of late years in Egypt must have been pleased, as well as surprised, on finding

themselves transported from Alexandria to Cairo, and from thence to Suez, in American cars, drawn by American locomotives. That peculiar institution, the American rocking-chair, may also now be found in the houses of most of the foreign residents. The only difficulty in establishing a brisk trade between Egypt and America arises from the fact that the products of the former are similar to those of our Southern States; namely, cotton, rice, sugar, and grain; and therefore she has no return cargoes to send us, nor any advantageous barter to propose to the Universal Yankee Nation.

I have thus hastily sketched the outline of the reign of Said Pacha in its earlier period, which was its brightest, for the glories of his morning were succeeded by a cloudy evening. His generosity, which made him the dupe and prey of adventurers, soured in his later days into almost universal distrust of mankind; his gayety was saddened by satiety, and his caprices grew with their indulgence. Flatterers, as numerous and pertinacious as the flies of Egypt, swarmed and buzzed around him, injuring his mental vision as much as those Egyptian plagues do the eyesight of the stranger. Treachery and falsehood dogged his footsteps, and the sound of truth grew strange in his ears. He gradually became less public-spirited, and more intent on his personal indulgence, while his natural tendency to obesity increased, making him unwieldy in body and sluggish in mind. His vivacity was succeeded by petulance and irritable impatience; and the seeds of a mortal disease, long latent in his system, developed themselves, and dragged him down the path which must be trodden by the feet of all mortal men, even though a king's.

But he fought his malady as bravely and as resolutely as he would have encountered any human foe. His European physicians recommended change of air and scene—that last specific when all other arts have failed; and he came to Paris, to seek in that magical city on the banks of the Seine the health denied him by the waters of his native Nile. The last time I ever saw him was in that city, in the summer of 1862, and it was then evident that his days were numbered. His increasing feebleness was only the more perceptible from the contrast with the huge bulk of his body, swollen and flaccid with disease.

But his manner had not lost its old charm, and his greeting was as frank and hearty as of old. His mind, too, seemed as vigorous as ever; and his comments on men and things at Paris, and the specimens of its society he saw, were marked by much acumen and caustic humor.

The impressions made by that artificial life on an Eastern child of nature were both curious and instructive.

He foresaw his own fate, and awaited it with more than Roman stoicism, with the resigned fatalism of the Oriental which is his faith; for Islam means resignation, and predestination is

the cardinal doctrine of its creed. He returned shortly after to Egypt, only to die, and was interred with great pomp at the family burying-place in a vault attached to the crumbling palaces of the old Memlook sultans, in the desert, just outside the Bab el Nasr (or Gate of Victory) at Cairo. He had just reached middle age, and few monarchs, in any country, have been as sincerely mourned, or have left more real friends behind them than did Said Pacha, who, although not without his faults and follies—for he was a man, not an angel—was yet at heart a noble human being, as well as a just, humane, and judicious ruler over the country which Providence had confided to his care.

"Requiescat in pace!" or, as a Turk would phrase it, "Allah Kerim!" (God's will be done).

DELIVERANCE ARMSTRONG.

I WAS nursery governess at Squire Raynham's when I first met George Smith. You see, I was all alone in the world, with nothing but my wits, a good temper, and a fair face, if I do say it, and a willing heart, with which to earn a livelihood. To be sure, I had received a common school education, as the saying is, and a very common one it proved, as it did not enable me to fill the place of governess proper to Squire Raynham's elder children, at that time a situation which I coveted. But I must content myself in the nursery, and it was not a very hard lot either—that is, it wouldn't have been had I been satisfied to remain in it, instead of reaching after greater things; but I was all the time looking forward to the day when I should have educated myself up to the standard of some higher employment; and as you may know, what with taking the entire charge of three roistering children, who never *would* mind a word that was said to them—what with keeping their clothes in order and their faces clean, and telling them stories till they were sound asleep—what with attending to their elementary studies and never losing sight of them from morning till night, my task was no sinecure, and left me precious little time for self-improvement. But I did the best I could under the circumstances. Mrs. Raynham gave me leave to read the books in the library if I chose, and when the children were all in bed and the sewing all done up I used to take my lamp into the ante-room and read till I was almost blind; then I put the book under my pillow, and if I could wake up before the children—for which there was hardly a chance, for they always seemed to see the sun shining in their dreams—but if I was so lucky as to anticipate them, why, there was the book at hand and a nice quiet hour between us. I don't think I ever enjoyed any thing so much as that sweet, early hour, at least not till George came. And it wasn't a story-book either, though goodness knows I was as fond of a story as any young girl who is always expecting one of her own to happen along; and many is the time I have

hesitated between the "Bride of Lammermoor" or some volume of physical geography or astronomy. Now and then, too, I had a holiday; and Sundays I had always the privilege of taking the children to church with me, and of hearing good language and good advice, and here it was that I got into the habit of taking a note of such words as I did not understand, and looking them out in the big library-dictionary, and learning them by heart. And here, too, it was that I sat and listened to the great organ, and to the glorious old chants that rang through the church and stirred all the blood in one's heart till it leaped in answer. And here it was that I first saw George Smith, for he sang in the choir, behind the lattice carved in angels and seraphs' lyres. I don't think this was why I was so fond of church-going though; I believe I should have gone all the same if there had been no such person in the world as George Smith; but that there was, and that *he* went to church too, and sung in a way that thrilled one with the strangest emotions, didn't, at least, make it a lit unpleasant. And, truth to tell, I set my heart upon him at the first glance, but I kept my eyes on the prayer-book, and only stole a look at him by accident, as it were, which, considering the lattice and my distance from the choir, did not do much harm. For, you see, I was afraid that if I looked straight at him my eyes would just up and tell the whole story, and after that I should never dare to go to church again. But I tried not to think of him during services, except at the singing, and then it just seemed as if he spoke to me, and I had a right to let my thoughts wander out to him in reply. One day I overheard Squire Raynham say to his wife, "That young Smith has the finest voice in the choir, I think." And Mrs. Raynham said, "Yes; I wonder how he has found the time to cultivate it! Though, to be sure, people always find time for the things they love. I suppose that accounts for it." And then my face burned so I was obliged to drop little Gab's doll out the window for an excuse to run out of the room. I suppose this was prophetic of that which was to follow.

It was two or three weeks later, when I was taking the children home from church, that a loose horse came galloping headlong down the street, and I had just time enough to catch Gab in my arms, while the others ran for the fences, when he made a dash at us in his horrible playfulness, and would have crushed us beneath his glittering hoofs but for a young man who caught at the bridle and held him till the owner came up. I don't know whether it was the fright or what, but my heart beat so loudly I thought every one must hear it and be astonished, especially when the young man turned to me and asked if I was frightened, and then it beat ten times louder and choked my voice, for the young man was George Smith himself; and he took little Gab out of my arms and sat down on a door-step beside me, and I tried to mumble

out my thanks; and he smiled on me and tossed Gab in his strong arms and asked, "Aren't you the nursery governess at Squire Raynham's?" And it seemed to me that he must have thought of me before to know that; so I answered, "Yes; and you sing in the choir, I believe. I would rather hear you sing than any one else I know." And then he smiled again and said, "I would rather hear you speak than any other." And then he put Gab down and walked home with us across the fields; and shook hands at the door and hoped we should be good friends and meet often; and I ran up to the nursery window and watched him out of sight; and after that it seemed, somehow or other, as if the world was a hundredfold fairer, and the children weren't half so noisy as before, and the sewing went off like magic, while I went humming and light of heart about my work. My books suffered from this rival, however; I could no longer bind my thoughts to them as of yore. But there's one thing that is better than much learning, which every true woman chooses first. And so, in this way, George Smith grew into the habit of walking home with us after church every Sunday. How sorry I used to be when it stormed too hard for church to be considered, or if I were ill or any thing happened to keep me away; and I would have given a great deal to have known if he cared for the omission. And one Wednesday afternoon, as I was out for a stroll with little Gab, who should overtake us but George.

"Were you sick last Sunday, Miss Armstrong?" he asked. "I missed my walk with you fearfully."

I couldn't help showing how pleased I was at that, and I just answered: "Yes, I had a wretched headache, and I could have cried to lose all the beautiful chants, and—" Then I bethought myself and hesitated.

"And what?" said he.

"Isn't that enough?"

"No," laughing, "that isn't enough; is it, Gab?"

"No," said Gab, appropriately, "'t isn't 'nuff—candy too;" and, as George didn't take the hint, she suggested, "Pockets, Mr. Smit." So we sat down on a rustic stile, and Gab began to search all his pockets for the sweet morsels, and amused herself with the odd things she found there; while George and I talked about every thing under the sun, and he explained his work to me, which, after all, I didn't in the least understand, you know, but should have liked all the same to hear him speak had it been in a dead language; for he was a mechanic, and the ideas he had about machinery, and the plans for improvements and inventions, were very magnificent, I have no doubt, but somewhat incomprehensible to me. I really believe that he thought his machines were alive and endowed with the bump of judgment. But there was one thing I did understand, in my feeble way, and that was music; and so, when he ceased speaking for a little space, and sat look-

ing straight into my eyes, to make sure, it seemed to me, that I cared for the things he had been talking of, then I began:

"But, Mr. Smith—"

"My name is George, as you may have heard," he interrupted.

"Your name Jorge?" broke in little Gab, diverted from her play for the moment. "My name's Gab."

"So I should think," he answered. Then to me: "You were going to say something, Miss Armstrong?"

"I was going to ask why you don't give up every thing to music; with such powers as yours you might make a famous public singer, and coin your millions, like Signor Chantilli, whom Mrs. Raynham went to the city to hear."

"I should be able to coin all my notes into gold, shouldn't I? But, you see, I think better of music than to make it my genius, my slave, to fetch and carry for me. When I should have used it for my material needs, I fear I should lose perception of its higher service. *Now* it is my recreation, my solace after hard work of hand or brain—a sort of religion that keeps me out of harm's way."

"Oh yes, one must have a pure heart, I think, in order to sing beautifully; and then there's such a difference in voices—one touches you not at all, while another searches your soul and finds all manner of sweet and holy echoes there," I said.

"Yes," he returned, "that's a very pretty idea of yours, Miss Armstrong. Music is a reminiscence of heaven; and then a man must have something to love, Miss Armstrong—a man who has no wife to make his home happy;" and he looked so hard at me out of his wide gray eyes that I couldn't, for the life of me, keep the blushes out of my face. I am afraid that Gab and I found it all too pleasant, and when we reached home Gab was eloquent on the subject of "pockets and candy and Mr. Smit," though I think candy was pre-eminent in her depraved mind. The following day I had an errand to do for Mrs. Raynham, and I took the same path we had found so sweet on the yesterday—the path across the fields and over the stile and through the tangle of alders into town, for we lived full three-quarters of a mile outside. I stopped on the stile, thinking of George and all the kind things he had said sitting there beside me; and I looked at the great blue sky all sheeted in sunshine, at the ferns and grasses underfoot, and thought, "what if, some day, he should think to love me;" and then the tears gushed into my eyes, and a strong throb of emotion stirred me—a throb which was half of fear lest he never would, and half of joy that he might; and just then something glittered in the grass below, and I sprung down and raised a small gold locket, chased in all manner of lovely designs, and hoarding the picture of a sweet-faced girl. Gab had dropped it from George's pocket, that was plain. There were no longer any tears in my eyes; this smile

ing face had swept away all my visions like dusty cobwebs; I was downright jealous. I'm sure I can't tell how long I may have stood there, growing every instant more desolate and hungry; but at length I put the locket out of sight, meaning to return it to Mr. Smith with the coolest indifference, as if it were a matter of course that he should carry about with him the picture of one woman while making something very much like love to another. It was such a tiresome walk into town and back after that! All the elasticity had gone out of me; the perfumes of the fields, the little winds that shivered through the alders, the lonesome reaches of blue sky, gave me a new sense of isolation. It wasn't at all the same world for the rest of that week; my duties hung about my neck like a millstone; I just dragged through with them as much dead as alive; I don't believe that I answered a single question coherently, and I never once opened a book; but I used to take out the locket and look at it by stealth, and wonder if she were really *his* love, till I was half crazed. You see I was deeply in love, with no mitigating circumstances; a love that is a little *passé* now, I fear, or it seems to me that Arabella would hardly leave the sound of Ernest's voice to go waltzing down the public hall in the embrace of Don Guzman, whom she has met for the first time to-night.

But Sunday came at last; and when I stood in the pew and heard *his* voice chanting in the *Te Deum*, it appeared to me that if I lost him I could never, never, in all the world, give thanks for any thing again, or follow that divine prayer with the strength of my soul; and then I made a great struggle not to indulge jealousy in church, and all the time my mind was so busy with the face in the locket, considering her ways, her circumstances, her prettiness, that before I was aware the congregation was thronging out of church, and little Gab was pulling at my muslin mantle, and George was coming down the broad aisle, while the sun shining in through the painted windows threw little patches of rainbows here and there, and made the church walls resemble the illuminations of an old missal in the Squire's library.

I had never waited for Mr. Smith before; he had always managed to overtake me; but now, I can't tell why, but I shut Gab's little hand in mine, as a sort of stay, and stood still there waiting for him. He was pleased at that, I fancied; and then I was provoked at myself for allowing such a fancy. What business had I to be fancying things about another girl's lover?

"You look like some Catholic saint," he said, giving me a hand; "some Catholic saint, just stepped out of a cathedral window—the patroness of little children."

"I don't know any thing about the Catholic saints," I cried, a little stiffly, for already my heart was melting at the sight, the sound of him, the touch of his cool fingers, the *something* in his tender eyes that was not indifference, and

might be love. I needed all the firmness I could master. "I don't know any thing about the Catholic saints," I repeated. "Good Protestants—"

"Good Protestants look so hard at their prayer-books that they forget to rise in the creed!"

"I didn't—did I?" catching myself up.

"Give me the book; I wish to see what fixed your attention. Ah—two tears," he said, opening it at the place; two tears shut in between the leaves, pressed like sacred flowers, for safe-keeping. I shall take the hint;" and he put my prayer-book into his pocket and gave his own to me.

"Oh, Mr. Smith," I demurred.

"His name's Jorge," corrected little Gab.

"So it is, Gab; do you keep her in mind of that, dear child," said George.

We were out in the lanes now, and the sweet breath of heaven blew fresh in our faces, and for the time I had quite forgotten about the locket, when, happening to put my hand into my pocket, my fingers closed upon it, and the blood began to quicken and my heart to leap and plunge; and I tried to speak, but the words died in a whisper.

"What's the matter, Di?" said George, regarding me. "You were going to say something?"

"Yes. I was going to ask if you had lost any thing—"

"Indeed I have," he answered, with a mischievous drollery in his eyes; "and I hope you have found it, and will value it enough to keep it."

"I *have* found it," I said, answering according to the letter; "but I don't think you can be quite in earnest about my keeping it. And then, besides, it is of no value to me, and it is probably priceless to you;" and here I held the locket up before his eyes.

"Oh, that's it, is it?" he said, and he did not color or look in the least discomfited. "I hadn't missed it at all. Where did you find it?"

"Near the stile where Gab picked your pockets last week."

"Yes, the little foot-pad!" Then touching the spring: "Now I dare say you thought this a picture of my sweet-heart?"

"It is pretty enough to be," I evaded.

"Do you think so? I believe, however, it is a notorious fact that we always prefer other men's sisters to our own. Have you a brother, Di?"

"No, I have no one."

"No one? Don't speak so disconsolately, child. You may be sure there's some one in the world who belongs to you, who is nearer than flesh and blood, who cares for you more than for himself, and he may not be so far off as you imagine either."

"I don't imagine any thing about him," I answered, loftily.

"Don't you? Well, I'm going to imagine a little affair: I am imagining that I see you go-

ing into the city to-morrow with me; that we proceed to the photographer's, where you sit for a picture which shall belong to me, and which I shall inclose in this locket—as a guard, you know, to prevent me from losing it again!”

“My imagination isn't so vigorous as yours; it won't carry me so far,” I said, half pleased and a little doubtful.

“Very well,” he returned, and we walked on some distance in silence; and when I could bear it no longer, “Are you displeased, Mr. Smith?” I ventured.

“Mr. Smith is not displeased, Miss Armstrong; he is merely disappointed. You have a natural and reasonable right to refuse him your picture, if you don't care to have his—which indifference isn't at all surprising.”

“Oh, but—”

“But what?”

“You didn't say any thing about *that*!”

“Because I'm a bashful young man, and expected to be teased for it, you little goose.”

“I am sorry, but—”

“You will go?”

“Maybe. If Mrs. Raynham can spare me.”

“She'll have to spare you one of these days, Di, with a vengeance; she might as well try to get used to it.” And by this we had reached home, and there was no need of replying.

“Mamma!” cried Gab, the instant she was within hearing, rushing into the house and leaving all the doors open. “Mamma, can you spare Di? Jorge wants her!”

Mr. Smith was just going down the yard, and he turned round and laughed, and called to me that Gab was a faithful witness; but I could have sunk into the ground where I stood.

I was, indeed, very happy in those days, when I wore the locket with his picture in it at my throat—the locket which he had bought for me at the time of our visit to the city; when I was sure of seeing him every Sunday, of hearing him sing behind the carved lattice; when he had grown into the habit of dropping in to see me now and then of an evening, when the children had been safely convoyed to the Land of Nod by genii and enchanters, and we sat together in the ante-room and exchanged schemes and sympathies. And he grew dear to me because he believed me worthy to understand his hopes and assuage his fears; and I grew nearer to him, perhaps, because I took them into my heart so entirely and hospitably entreated them. We had great ambitions in those days; he was but a mechanic, and he hoped to become an inventor; I was but a poor little nursery governess, and I strove to climb higher. But I doubt if any merely material success in life could have increased our happiness, when we sat together there with love lingering in our eyes and smothered upon our lips; when the lamp burned dimly, and moths flew in at the open window and scorched their pretty wings at the flame, and my needle grew heavy, and the honey-suckle lent a flavor to the hour; while words came slowly spoken, and meant less than the love-

glances faintly read by that fading light; then the pressure of tender hands, the silences of two confident hearts.

Those were happy, happy days, that waned at length and went out in no effulgence of twilight, in shadows vast and woeful.

I recall the last Sunday on which we walked together through the fields and lanes, lifeless now beneath December snows, beneath pallid winter skies; but I felt no dread so long as he walked by my side; fearing no misfortune, seeing no ghost of trouble in the perspective.

“Well,” said he, as we turned our faces homeward, “you will not hear me sing next Sunday, and I shall not walk this way with you again, perhaps, for many a long day—perhaps never; for when friends part, who can say when or where or how they will meet?”

“When friends part!” I repeated, astounded. “What do you mean, Mr. Smith?”

“I should have told you at first, I suppose; but, you see, the arrangements were not perfected, and I didn't care to speak of an uncertainty.”

A horrible suspicion possessed me then.

“Are you going to be married?” I asked, at first thought, my pulse standing still.

“I don't know,” he answered, laughing. “I wish you would tell me. But it is not *that*. I have received the offer of a more profitable situation in the city, and I have hesitated accepting on many accounts; but on sober thought I perceive that though it will leave me less time to work out my own ideas, still I shall be better paid; and without money, you know, all my schemes will fall to the ground and profit me nothing.”

“I see,” I responded, faintly. Just then neither money nor schemes weighed in the balance with the loss of his companionship.

“You are sorry, little girl,” he said, observing my dejection; “but I don't mean to lose sight of you. I shall come sometimes, if you will let me; at least you will hear from me; you will hear something, perhaps, that you ought to know already.” And he took both my hands in his, and looked in my face silently and earnestly, and said “Good-by;” and I watched him disappear down the crooked path with tears in my eyes that blotted out both road and lover.

That first week, with no hope beckoning at its end, was a dreary week enough to me: storms shut us in upon ourselves; winds raved and shrieked about our ears. I sat by the window and sewed, and watched the white drifts built up, flake after flake, and the wild white whirl of the elements, while little Gab stood at my feet and wondered if they could make a snow man in the yard to-morrow, and the other children ran an imaginary express train through the nursery, ante-room, and entry, with letting off of volumes of steam—im-perceptible except to the ear—with braking up at countless stations, and all the attendant clamor, till it was hard to tell whether one was

in Bedlam or out of it, or expressed for that locality. And Sunday came at last, a miracle of blue and gold, and bells ringing on the frosty air; and with it a chance to me of finding out whether I went to church to worship God or man.

But the following Tuesday I doubt if I ever forget. The wind had only backed round, as they say, and it had come up full as stormy, as bleak, as hopeless as the week before. Gab still hung about my knee with her unanswerable questions, and the others, dissatisfied with railway life and civilization, had indued blankets and wampum, and were rehearsing an Indian war-dance, which had at least the virtue of demonstrating that their lessons were not thrown away upon them. But the wind was no longer a trouble to me, nor Gab a fret, nor the war-hoop a torture, for early that morning the house-maid had brought me up a letter, and Gab had climbed on the back of my chair and followed the lines with her little first-finger, as if she could understand, and Letty had spelled out the direction on the envelope, and Tommy had begged the stamp, before I comprehended that George Smith had asked me to marry him! Storms might do their worst, for I was sheltered in love. What I replied to him it would not be hard to imagine, and I distinctly remember contemplating the superscription of my letter by the light of my candle with intense satisfaction.

"Mr. G. L. Smith" was not a name to be despised, even though it were as common as clay, so long as it represented the one who loved me best—the George Smith I loved.

So the days went by, and I waited in a happy suspense. I heard the children's lessons and washed their faces and mended their rents and endured their prattle without a murmur, without a thought of the work in hand, so wrapped was I in this transparent atmosphere of happiness, through which I saw the outer, everyday world as in a dream, faint and far and picturesquely disposed, and roseate with the color of my thoughts. So the days melted into nights, and night fled before the dawn, and seven times the sunrise crimsoned all the silvery heights and headlands, and brought blue billows of air to arch above, but brought no word, no token, no lover to me. But what did a week's silence signify? He was ill or absent; he was waiting till he could come himself. I knew that he loved me; my response had satisfied him; henceforth we understood each other; if we never met again for a thousand years, nor exchanged a syllable by tongue or pen, still our hearts would beat in harmony—undivided, unchanged.

But, in spite of my sophisms, a little uneasiness crept in upon me as, day by day, I watched the white stretch of road winding out of sight among the whiter hills, if so be he might pass that way; at any moment he might be rounding into view, and a dozen times of an afternoon I left my work and lifted the curtain,

straining my eyes and sending my heart out across the barren waste in pitiful yearnings.

But he did not come or send.

The postman clattered to the door with business dispatches for the Squire, with invitations to the family, with valentines to the children, with scrawls for Bridget, and scented billets for *Mademoiselle*, the governess, but nothing, nothing for me! And all day long the pain seemed growing at my heart and choking my speech, till at night it spent itself in tears that drenched my pillow, and then dropped back at cock-crow to remain a dumb, hard agony at my heart again.

It was a month now since I had mailed my letter.

One day Mrs. Raynham came into the nursery to cut out some work for me; she had been to the city on the yesterday, and I longed to know if she had seen George Smith, but never dared to ask. Little Gab sat thoughtfully at my feet, knitting her pretty brows over the serid of patchwork I had prepared for her, when, Heaven knows what moved the child, but she put down her work—it was all in a snarl, to be sure, from the thread being tied into the needle—and, looking a long way off, said, with a sigh:

"I should so like to see Jorge!"

"Jorge who?" imitated her mother, laughing.

"Jorge," as if there were but one in the world.

"Didi's Jorge."

"Should you?" said Mrs. Raynham, again.

"I asked him to come out and see us, yesterday, when I was in the city, but he pleaded business. How is *that*, Miss Armstrong?" The great, dumb ice-clog at my heart stirred and palpitated and threatened an inundation. "How is that, Miss Armstrong?" she repeated. "I used to think—but there, it's none of my business to think at all about it. Here, Gab, let me measure your sleeve, dear."

So George was still in the land of the living, not ill, not absent, not even meaning to come; too busy, too busy for love. How I longed and ached to ask Mrs. Raynham concerning him, to lead her on to speak of him, to hear how he looked, what he said, something, any thing, every thing. It was plain that she thought me to blame in the affair; well, so let it pass.

Perhaps I was all wrong; perhaps if I had given her my confidence all might have gone well with me yet; at least it would have afforded a healthful vent for sorrow, if nothing else; but I had a sort of horror of pity in those days; rather let me endure alone, with none to mark my sighs or count my tears.

The snows melted from height and hollow; the earth turned its cheek to the warm sun and blushed beneath; birds came back and built their nests, and sung and twittered among the eaves; the brooks called to each, and the echoes replied;

"The sunshine kept its promise true;"

and all the while my sorrow grew with the year

and waxed greener, and strengthened with the sun, and found no voice, no balm. . . What was the spring to me? or the summer's green magnificence? And did it not rather heighten present pain to know, to feel, that as surely as the day this pain would pale with the years to come, would become a dream, a phantom, a feeble, vain regret? Not that pain itself is so sweet, but is it not better than torpidity, than the absence of emotion? For when pain was dead, love too would be stark and cold; for this was its death-throes, and this love had been my treasure, laid up, it may be, where moths corrupt and thieves break in, but still my treasure. It was hard to part even with its semblance, when one had nothing dearer to turn to.

Well, now that I had nothing sweeter to do with my life, I devoted it to work. I did not mope after the fashion of some, in a listless idleness. I did with all my might whatsoever my hands found to do, and I had my reward. Perhaps I cared to show George Smith that the woman he had scorned and wounded was more worthy his regard than he had counted upon, had depths he had never sounded, was a woman who could hide her wound, and smile while it bled inwardly. But after that first summer I turned my back upon the past; I turned my face toward the undiscovered future. Henceforth George Smith was to have no part in my life—why should he usurp my thoughts? So I exiled him. I refused to listen to the beguilings of memory; if my mind reverted to any of those past scenes, while the gloaming fell or the fire-light flickered, I sprang up and lit my candle, and sent my thoughts traveling away into the days of the Merovingian kings, among the Goths and Vandals, and I promise you that George Smith very soon retreated before those barbarous hordes. And the next spring I gave up my situation at Squire Raynham's, and with the pittance I had reserved entered a normal school, in order, at this late day, to finish my education. For four years I delved like any slave, up early, and late to bed; dining off crackers, supping on oatmeal porridge, because it was both cheap and nutritious; sometimes breakfasting on anticipation. They were joyless years too, except that I loved my task, that I meant to conquer; and once during that time I saw *him*—I heard *him* speak. It was in the first year of my novitiate, in the month of March, in a horse-car. His back was toward me, and the thick folds of my veil concealed my features, even had he looked at me. He was speaking with a friend when I entered the car on some improvement in mechanics, and after a little this friend said, leaving the subject:

"You are not married, I think?"

"No, I am not married," in under-tone.

"Well," pursued the other, "with a man of your schemes it is best to remain single. A family is a clog, so to speak—a very agreeable clog, let me assure you, however. But inventions need money, and so do families. You have chosen the one—I the other."

"Perhaps it is an affair of circumstances rather than of choice," I heard him say; and then he pulled the strap, and the little bell pealed, and they left the car together. I never turned my eyes to watch him out of sight. He had dropped a glove, but I did not pick it up, as once I might have done. He had not so much as glanced at me—the stumbling-block, the enemy of the inventive faculty—why should I waste a look upon him? And so he passed out of my life again, unconscious that he had touched it, careless perhaps. My four years of preparation came at last to an end, and one morning I found myself the first assistant at Mount Hope Seminary, with a salary that looked like a fortune. I had traversed the slough, I had climbed the hill without failing; the prospect looked inviting. Was this the Promised Land that opened before me? I was no longer poor and wretched and of no account, doomed to the nursery and the drudgery of a primer; I had emerged from the chrysalis. But even butterflies have their tribulations.

My inaugural day at Mount Hope was any thing but a holiday. The scrutiny of some hundreds of merciless eyes was something just escaping the agonizing, and when the principal turned to consult me—*me*—I could have dissolved into nothingness, and been glad of the relief. For the first time in many years I felt anxious concerning my personal appearance. I wondered if my collar was awry; why I had never thought to wear a pretty ribbon; if those silly, giggling girls were amusing themselves with the fashion of my gown, the arrangement of my hair—very foolish thoughts for an assistant at Mount Hope. But then human nature is very much the same, I suspect, in pupil and teacher, and neither cares to furnish entertainment of that sort for the other. If I could have gone away and cried a little while by myself I might have borne the trial better. As it was, I blundered through the day and had my cry after bedtime. But the battle is not always to the strong; even the weak come in for their share of the spoils.

Mr. Gregory Smith, the principal, sat on his throne-chair and governed at discretion, lectured on his hobbies, attended to the elocution, and wrote witty notes to me, his grand vizier, as to the treatment of refractory subjects, and condescended in a most agreeable and fascinating manner, considering that I bore the burden and heat of the day and he received the credit. But that never occurred to me in those days, when I tied on my bonnet at night and heard him sigh and say:

"This is a dull life for us, Miss Armstrong; it seems to me that we are capable of something less like drudgery." Then I pitied him from the bottom of my foolish heart, and believed *he* was, and told him so, without giving a thought to my own share. And then sometimes he would take my hand and hold it up to the light, saying, "Wearing out in the service, little woman." And once he caught at the ring I wore, and

slipped it off and fitted it upon his own white fourth finger.

"What will *some one* say to that?" he laughed, looking me straight in the eyes.

"It is my own," I said. "Shall I wish it on for you—school-girl fashion?" laughing in my turn.

"Yes, do; wish it on by all means. It must stay there till the wish is fulfilled, I suppose?"

"Certainly; but what shall I wish?"

"Are you so blessed as to have no wish?" he asked, a little sadly.

"Not quite. Shall I wish you a legacy from some East Indian uncle?"

"No; for in that case I should leave Mount Hope."

"But you are tired of Mount Hope, I thought."

"But not of some of its inmates. Come, wish me, Deliverance—"

"From all false doctrine, heresy, and schism?"

"From any thing and any body but yourself."

"That's too sweeping. You have shown yourself incompetent to select a boon. I shall now do as I please about it. I wish that Miss Thornton may commit her French verbs to memory."

"Thank you. The ring's mine, then; for do it she never will: trip-hammers couldn't beat them into her. Shall I walk along your way, Miss Armstrong?" And after that, whenever I kept Miss Thornton beyond hours, he significantly requested me to *ring* if his co-operation was required.

One morning he looked over my shoulder while I signed the note I was writing to the parent of a pupil.

"You write a good hand," he was kind enough to say; "and you have a strong name: Deliverance Armstrong. It's a name I could never forget."

"I should think not; it's impressive, like a nightmare. Think of calling a child Deliverance, when such charming names as Rose and Blanche are running to waste!"

"Possessions look commonplace to the possessor. What do you think of Smith for a name? Thank your stars you are not a Smith—though, to be sure, you are born, but not buried. It's a positive injury to belong to that family, whose name ought rather to be Legion. If you compass the universe, if you have all learning or genius, it doesn't signify. You are a Smith, that tells the story. Nobody believes in the greatness of the Smiths."

"Except in Adam and Sydney Smith."

"Exceptions prove the rule. But then, perhaps, you have a friend among them?"

"I believe that I have," I said, without looking up.

"One, at least, if you will allow it. Did you ever know another?" indolently, as if the question were idle and of no moment to him.

"Yes, I have known another. Mr. Smith, it is nine o'clock. I hear the young ladies swarming in the passage-way. Shall I strike the bell?"

"If you will. I see the Smiths are not agreeable subjects. It illustrates my theory, that's all."

"You beg the question."

"I should be more likely to put it."

And so our daily lives ran on, side by side, for two years more; so we walked together after school, met at the morning exercises, exchanged a word between the classes; so I made him trifling gifts at his birthdays and holidays to keep the balance adjusted; so he lent me his choice books with tender passages underscored; so he made my opinions seem of moment to him and the world; so he made himself acceptable and important to me, till I awoke one day to find that I was doing and thinking every thing with regard to his view of it. I do not think I was in love with him, though I thought so then; I do not think he affected me as George Smith had done; but then sometimes one exhausts one's self in a first love, and perhaps I had nothing but an intense friendship left for any. I am confident, now, that if he had said good-by and gone away I should have experienced no such pain as that other, that I should have missed him, but without that bitter sense of isolation, that aching sense of the irrevocable. Even had he come to me and said, "Miss Armstrong, I am to be married to-morrow; Miss Thornton is going to shrink into a Smith, poor child!" I should have wished him joy—with some surprise, to be sure, since his manner had grown so like a lover's—with only the pain that any interrupted friendship might occasion. I should have blamed my vanity for the mistake, and not him. But when he came to me and said, instead: "Miss Armstrong, I have a gift for you, if you will accept it; it is something that has belonged to you since some months, but you may not think it valuable. Miss Armstrong, I am going to give you my heart." "And I am going to accept it, Mr. Smith," I answered him. I thought that I knew his nature, that I understood his temperament, that at least we harmonized; and I was confidently happy during the weeks that followed; but with such a different happiness from that which a poor little nursery governess had known seven years before—a happiness which had been all made up of sun-lighted perspectives stretching away into enchanted regions. Well, no two eras in the lives of individuals or nations resemble each other in every particular, and perhaps we forget the flavor of joy as well as of pain, and are thus misled by false lights into dangerous quagmires.

Mr. Gregory Smith was a handsome man, with large brown eyes that suggested unfathomed depths of character—just such a man, in short, as school-girls of the more advanced class rave over, and write about in their diaries; and now, since half of those under my charge were blighted in their young affections through him, I come in for a large share of petty jealousies and malice prepense. All things considered, it was exceedingly agreeable to read such dialogue as this on the margin of books given in at recitations:

"Don't you think A——g is spooney to-day?"

"*Extraordinary.*"

"Why is Mr. S—— like Daniel in the lion's den?"

"Give it up."

"Because he's sure of Deliverance!"

It was at least amusing rather than otherwise, and I should have been taught by the fact that my emotions were not genuine.

In the mean time Mr. Smith purchased his house; and I, who had been drifting about on stormy seas all my life, or climbing other people's stairs, felt a little elated, perhaps, at the prospect of being mistress in a house so inviting. He had the carpenters and glaziers in making repairs; he consulted me as to the style of furnishing, while I selected the nappery, and looked at Lyon's silks and *gros grains*. We had been engaged two months.

One night, during vacation, I lit my gas and took up a package of books which Mr. Smith had sent me to read; they had been lying in their wraps some weeks already, as I had not found the moment in which to surrender myself to them. But now I seemed to have nothing better or more urgent to do, so I took them out and run over their contents, in the desultory way one has when one would like to be able to absorb half a dozen at once. They were all of old date, but such as I had never chanced upon, and each bore on the fly-leaf the name of "Gregory Lauriston Smith." They had evidently not been opened for years, and even as I turned the leaves of "Undine" something fluttered out and fell at my feet, some folded sheet, that had perhaps been slipped in to mark the place. I let it lie a little space, while I followed Huldrand through the enchanted forest, till presently it occurred to me to replace this mark before closing the volume. I had no intention of examining it, but as I put it back and was in the act of closing the leaves of the book over it something drew my eye inadvertently, something familiar about a name written there in full—the name of Deliverance Armstrong, in my own hand! I had never indited a syllable to Gregory Smith in my life; there had happily been no need of it, having seen him every day of our acquaintance; and at first thought I fancied it must be some scrid I had thrown aside, and of which he had possessed himself *pour amour de moi*. At least I had certainly the right to inquire into that which concerned me so nearly; and here unfolding it, my gaze grew suddenly blurred and fixed, and my pulses beat double measure, for I held in my hand the letter without its envelope which I had mailed to George Smith seven years before! A thousand thoughts surged across my brain in that instant; illuminations, mystifications. Were George and Gregory Smith one and the same? or how related? Had this volume of "Undine" ever been in the hands of George Smith? Had he ever read a syllable of this response? *And if he had not!* All my

thoughts swayed backward then. I saw George waiting as I had waited, as hopelessly, as painfully, and my heart grew cold in my breast, laboring heavily with this tide of emotion, with this swollen, stormy tide, breaking down all barriers, overleaping all obstacles, delaying for nothing, impatient and reckless so that it brought my ship to shore again. I was once more the same girl who bore the title of nursery governess at Squire Raynham's, who listened in rapt delight to the voices of the choir throbbing through the old church at Raynham village, who walked the fields as light of heart as the bees and birds, inasmuch as I loved George Smith and not Gregory.

I read no more in "Undine." What was Huldrand, or the necklace, or the dismal haunted forest to me? I had found my Huldrand.

I went to bed, and tossed and muttered in my dreams, and longed for the day; and when it came I sent for Mr. Gregory Smith. He answered my summons with lover-like alacrity, merely asking what had procured him such a pleasure. I held the fatal letter crushed in my hand, while I said:

"I sent to ask if you ever knew, or spoke with, or held any communication with a person of the name of George Luther Smith."

"Now, really, love, you are too bad. How can I possibly remember all the Smiths I may have exchanged a word with? George Luther," he repeated, reflectively. "Heavens, what a combination! I don't recall any such monstrosity among my acquaintance, dear. Are you ill to-day?"

"No; I am not ill. I am disturbed. I am perplexed. Perhaps you will be able to help me."

"Without a doubt. I'm a sort of prestigator, who can change all manner of troubles into happinesses."

"I hope so. In the first place, I want to tell you something that happened to me once—something that I ought to have told you before, perhaps."

"In short, you wish me to act as father confessor? I absolve you beforehand, dear."

"Wait till you hear my story. Seven years ago—"

"Excuse me, but the events of seven years ago are myths to-day. What do they signify? They are unsubstantial shadows."

"Perhaps so. But seven years ago I loved a mechanic of the name of George Luther Smith. I received a proposal of marriage from him, by letter, which I answered by letter accepting, and since that day I have had no word from him."

"The scoundrel!"

"No. I have reason to think that my letter never reached him—"

"Oh, nonsense—the wretch! what a refinement of charity on your part! But there—you can't expect me to be severe upon him; he did me a good turn, you must allow!"

"I don't know. Do you keep a dead-letter office, Mr. Smith? I have reason to believe that my letter never reached George Smith, or how could I have found it in your copy of 'Undine?' *How did that happen, Mr. Smith?*"

"The letter you wrote to George Smith!" he cried, "and in *my* book!" after Lady Macbeth.

"You are a greater prestigator than you believed. How did you manage it?" He seemed in no wise agitated, and, leaning against the mantle, let his eye wander over the written page.

"Well, now that I am in for it," he said, in his light vein, "I may as well tell the whole story, I suppose. The father confessor turned penitent, in sackcloth and ashes. This letter isn't a stranger to me, I acknowledge; but I had lost sight of it, positively; didn't know its whereabouts any more than the man in the moon, or, of course, I shouldn't have sent you the book. *Mem.*: never lend books without administering a sound shaking first. Well, you see, before coming to Mount Hope I taught a while in Suffolk County after leaving college. One morning, up comes the postman with my letters, and here's one among them addressed to Mr. G. L. Smith.—You ought to be more particular, my dear, in future. I shouldn't fancy another man reading *my* love-letters.—Of course I opened it—wouldn't you have done so? And of course I read it—who ever refuses to read a love-letter, especially yours? And as I didn't know any other G. L. Smith but my blessed self, and as I was pretty positive I hadn't proposed to any Deliverance Armstrong—that was seven years ago, you know—I was all at sea, so to speak; and that's how I happened to let it lie about among my papers, always meaning to do something about it, never seeing my way clear, and never doing it—for what was the good of sending it afloat again, only to fall into the hands of another Smith than the right one? And so I forgot all about it, and it got slipped into that treacherous book—the deuce knows how, I don't!"

"And you forgot all about it, notwithstanding that 'Deliverance Armstrong is a name you could never forget!'" I quoted.

"I thought that coming events cast their shadows before, without a doubt, when you came across my path. I couldn't swear but there was more than one Deliverance Armstrong in the world; what business had I to show another woman *her* letter? Wasn't it bad enough to read it myself? Besides, what was the use of stirring up old troubles? Very likely Mr. G. L. Smith is married or dead. Shall we forward this letter to him?"

"You may give it to me, if you please." But he still kept it. "Mr. Smith," I continued, "this discovery has changed our relations. I find—"

"Now, really, dear, I don't see *that*."

"But I do not love you any longer. I doubt if ever I did love you. I deceived myself—"

"Preposterous!"

"I thought George Smith had wronged me cruelly; I find that we have changed places, he and I, through no fault of mine; and the love I had buried out of sight has had a resurrection."

"Unfortunate. What are you going to do with it?" he asked, nonchalantly, folding the letter.

"Will you give it to me, Mr. Smith?" I reiterated, holding out my hand.

"I don't see that it is yours, my love; when once you mail a letter it ceases to belong to you. This little epistle belongs to Mr. G. L. Smith, and am I not that inestimable personage? 'Tuesday evening,' he read, referring to the letter again. "No other date of month or year. How very careless of you; but then how very natural in writing to a lover in the same town, don't you see?"

I did not see his motive, nor understand the connection, and my face must have shown it.

"I should like my letter," I persisted, for his manner displeased me. "And I must beg leave to end this, to me, painful interview."

His face paled to an ashen hue, his eyes dilating and glittering like some murderous weapon, some poisoned poniard.

"Do you mean that you wish the engagement dissolved? Do you refuse to fulfill the compact? Now that things have progressed so far? Consider what Mrs. Grundy will say on the subject. What reasonable reasons can you offer that potentate for such a graceless caprice?"

"Not even Mrs. Grundy could constrain me to marry where I do not love," I answered, rising suggestively.

"Not even your word? Come, now, let us be rational, and drop morbid sentimentality. It is improbable that your affection should have survived the test of seven years' absence. By-the-way, have you preserved his letter of proposal?"

I did not pause to consider that the question was unnecessary and an impertinence. In my haste to abridge the scene I would have answered almost any thing in reason, and some things without reason. Thus I returned:

"What would have been the good of keeping it? I burned it, of course."

"Just so. Now what is the good of resuscitating this feeling about the writer? Is it at all probable you will ever meet again? And what if you should, when you have both outlived the attachment?"

"Mr. Smith," I interrupted, "I would rather hear no more of this. I have given you my decision. *I can not marry you.*"

"*But you shall!* Or, as truly as I live and breathe, this thing shall go into court; this letter shall bear witness against you; your name shall be the common property of bar-room loungers and newspaper reporters. This precious love-letter which you so dote upon shall be the taunt of these school-girls who appreciate you. And what board of trustees will engage as a

teacher a character so notorious? Your occupation will be gone. Choose."

I saw it all then in a flash; the evidence was clear against me, if he wished to use it; and he had meant it from the beginning.

"You have shown me that I chose wisely," I said, moving toward the door; for my wrath was struggling for the mastery. "You have shown me that I chose wisely and well; and I leave you to your own wicked devices, and trust that the public will be more merciful than one who has pretended to love me!" And I left him alone, the qualms of conscience with which I had met him fairly dissipated, confident that a nature of such coarse grain possessed no tender sensibilities.

And he kept his word. My letter, which had given me such a thrill of happiness to indite, which had given me so many heart-burnings to endure, was bandied from mouth to mouth, was the tid-bit of gossips over their fragrant hyson, was reported in the newspapers, was cried in the avenues, was the by-word of every urchin in the streets. Even my name contributed to the general amusement, afforded scope for the small wit of paragraph writers. I was pointed out in the horse-cars—for one who earns her daily bread by the sweat of brow or brain can not always hide herself from the vulgar gaze in the shadow of a home: so I was pointed out in the cars, and stared at in the streets, and led a life of anguish and embarrassment, only consoled by the reflection that not all the law of the republic, with Coke and Blackstone at its back, could oblige me to marry Gregory Lauriston Smith. It is an ill wind that blows no one any good, however. When my quondam lover carried his suit into court he rendered the greatest service I could have asked, strange as it may appear. His revenge purchased my reward. His anger was the conducting medium between George Smith and myself. He won the case, to be sure; and so, in another sense, did I; and the damages in the one were not so heavy as the benefits in the other were sweet.

I had sent in my resignation to the trustees of Mount Hope Seminary some time before, and I was engaged one evening in writing an advertisement for a situation of some kind when the bell rang, and a visitor was shown into the adjoining drawing-room, for I was at work in Mrs. Angle's private parlor, and presently the maid tapped on the door and said,

"There's some one to see you, Miss."

"Who is it, Batkins?" I asked.

"Mr. Smith, please."

"Tell him I am engaged." How dared the villain impose himself upon me again? Hadn't I suffered enough from his treachery?

"What are you waiting for, Batkins?" as she still lingered.

"Please, marm, but *I don't think it's the one.*"

"Yes, it is the one," said a breezy voice in the hall. "There, Batkins, you can be excused;" and it was George Smith himself who

closed the door upon her. I dare say she attached herself to the keyhole—and—well, what would you give to know what followed?

"Were you writing to me?" laughed George, when we had exchanged experiences, *et cætera*.

"I was applying for a situation," I returned.

"And the situation has come to you," tossing the sheet into the grate. "Do you know I am comparatively a rich man, Di? I have patented an invention, and it's a paying concern."

"Inventions usually enrich any one but the inventor," I said.

"But mine isn't of that kind. Don't you remember that we used to talk about it in our castle-building in the dear old fields at Raynham? By-the-by, we will go down there on our wedding-tour, and see little Gab."

"Little Gab is a dignified Miss Gabrielle by this time. Dear me, seven years are a little eternity."

"But they are past, dear; and I loved you through every one of them, you and no other. I could never get over it, and I never tried to; and if this blessed breach-of-promise case hadn't made public all the ins and outs I should have died a bachelor."

And just then Mrs. Angle came blundering in.

A CORNISH CARNIVAL.

ON the one hand a great number of people were well acquainted with every phase and feature, every legend and tradition, every supposition and conjecture concerning and respecting the day I had determined to depict. But, on the other hand, a vast number of people were utterly ignorant of every thing about it. Even its name was unknown to them. These latter I resolved to address, feeling sure that in some of their unfamiliar breasts I should be able to kindle an interest in an unfamiliar custom that has flourished for centuries in the far west of England.

More than a year ago I heard from a Cornish man that on the 8th of May was annually held a Carnival of Flowers in the Cornish town of Helston. This year circumstances enabled me to take his advice to share in the festivities held in honor of Flora, and to see for myself how my countrymen and women essayed to carry out so æsthetic an idea.

From a luxuriantly beautiful village in the heart of well-wooded, well-watered, hill-and-valley-diversified Devonshire to the mining districts of Cornwall was a transition that was not pleasant to the eye. The railway route from Plymouth to Truro is fair enough to lead the stranger to hope that the wealth of verdure to which South Devon has accustomed him will last on and joyously add itself to the grand beauty of the rugged Cornish coast, which is generally so well represented at the Royal Academy. The distance from Doublebois to Lostwithiel, especially along the viaducts which run parallel with the many-hued Bodmin woods,

is as fine a specimen of sylvan scenery as the most infatuated lover of his country could desire to show to the most determined depreciator of the same. But after liquid-sounding Lost-withiel is passed the character of the land alters abruptly. Flat tracts of gorse-covered ground stretch away on every side, their monotony unbroken by wood or hill—unbroken, indeed, by any thing save mines at work or mines worked out. The difference between the mines that are in present prosperity and those whose prosperity is passed is apparent to the least initiated into mining mysteries. Around the former well-built cottages and well-kept gardens, the property and habitations of the miners, cluster thickly. The lately prosperous, where hopes and chimneys were alike raised high a while ago, are broken, desolate, deserted; but perhaps more picturesque, on the whole, in their desolation and desertion, in their grim and blackened quiet, which no man cares to disturb now, than are the ones about which hearts are still beating high as the shares they are anxious to buy or sell.

Mention was made just now of the gorse-covered tracts of land. From one end of the county to the other, at this season of the year, Cornwall is on the surface a land of gold. Wherever by some strange accident nature has omitted to plant a gorse-bush, waving branches of the more delicately golden broom supplies the color. But the gorse is the predominant growth. It tips all the hedgerows, and gilds the otherwise arid acres which have not yet been brought into cultivation, throwing a radiance round what is at once the sepulchre of many a mine and many a man's money.

Taken as a whole the nomenclature of Cornwall, both of people and places, is more euphonious than that of any other county. Menen-hoit, Surrier Gate, Gwinnear Road, Marazion—these are but a few of those which fall upon the ear most softly and linger there most pleasantly as the West Cornwall train languishes along at a pace which is in unison with the unhurried, unhurrying nature of its inhabitants. Traces of the old faith, too, are to be found on every side. St. Austell's, St. Cyre's, St. Clear's, St. Ives, St. Burion's, St. Fagan's, St. Germain's, St. Michael's—these are but a few of the saints whose names are perpetuated in this the land of them. Wayside Devotion (Mr. Boughton, you need not have gone to Brittany to make the charming picture to which you gave that title) must have obtained largely in Cornwall. If you come to four cross-roads, then surely at one of the corners will you find an old stone cross more or less mutilated, and more or less perfect in design, but very touching still in the indication it gives of the by-gone reverence and the visible aids which the Romish faith gives to her votaries.

Penzance was very beautiful on the night of the sixth of May this year. Her shore was not tourist-trimmed, and the white horses came

lashing up grandly in the bright moonlight. And about three miles to the left, in mid-ocean apparently, the "castled crag" of St. Michael's Mount frowned over the neighborhood to the full as proudly as that of Drachenfels can frown upon the Rhine. A great rugged mass, in which it was difficult to distinguish where rock ended and masonry began, it gloomed through the moonlight like a pure bit of medieval romance, and imbued beholders with a wholesome respect for the St. Aubyn name.

It is not all easy pleasure to get to St. Michael's Mount. If you snatch the hour of the tide being out you can walk to it over a rocky road from Marazion, and shatter yourself to pieces against boulders. There are a few retainers' and fishermen's houses at the foot of the Mount, and a few boats lying about to take the unwary who suffer themselves to be surprised by the tide back to Marazion. When these are passed the tough ascent commences; and it is sufficiently tough to make me wish that the lord of the castle, who is doubtless a model of courtesy, would have a lift such as is used in lofty hotels for the benefit of the fatigued and ready-to-be-delighted visitor.

A very slippery and precipitous path among rocks leads up to a platform from which about twenty cannon bristle at you. Then a few roughly hewn steps show the way to the little iron-girded black oak door which is the chief entrance. A good deal of the romance of the place is brushed away when that door is passed. For, though there is a good deal that is antique and interesting about both the architecture and furniture inside of the castle, there is nothing that corresponds to the rough, grand majesty of the exterior of it. There is a guard-room with a few quaint old helmets and cuirasses, stirrups and bridles, in it. Side by side with these hang little modern gilded frames containing the autographs of her Majesty and the Prince Consort, the Emperor of the French, and the Prince and Princess of Wales, together with the pens which they used on the occasions. Passing on from this through very narrow passages you are shown the Chevy Chase room, a saloon the walls of which are adorned with grotesque carvings illustrating the story of Chevy Chase. When you have looked at the chapel, which is fine, and an oak bed five hundred years old, a three-hundred-year-old chair, been down into the dungeon, in which a skeleton was found some years ago (another bony illustration of the well-known "kissing-crust and warden pie" and naughty Nan story), and sat in the chair at the summit of the castle, in which whoever sits first, husband or wife, shall be master for life—when you have done these things the inside interest of the castle is pretty well exhausted. Then go out on the precipitous slopes where huge patches of borage, painfully suggestive of claret-cup when no claret was to be had, grow in glorious profusion, or get down among the mighty rocks against which the Atlantic is always dashing itself, and, when you have glanced up at the

castle-crowned heights, own that St. Michael's Mount is as magnificent a private strong-hold as the heart of man could desire or the taste of man design.

The drive from Penzance to the Land's End is not a pretty one. The same flat, barren, mine-interspersed characteristics which belong to the Truro district, as seen from the rail, mark it. But a sight of the Logan Rock cheers travelers on their way—that wonderfully balanced monster stone, which is so nicely poised that a man's strength can rock it, and yet no storm can upset and hurl it from its place. It is a great pity that this region should be so guide-infested; there is something absurd about inquiring-minded tourists and big boulders being introduced to one another by the great sons of the soil, who lurk about for a couple of miles round the rock seeking whom they may devour.

The Land's End welcomed us with such a storm of thunder and lightning and lashing rain as has not been witnessed there for years. It was a superb salute on the part of the elements, which, like many another superb attention, was rather oppressive and alarming, but most strangely beautiful notwithstanding. There is a little hotel down very near to the extreme point of land, in which we sheltered, and in which it seemed to me that it would be a very sweet place to dwell if one had any work on hand that demanded quiet and security against the inroads of society. Standing there in the most magnificent solitude I ever invaded, a faint distaste for the ensuing Flora-day festivities and the world of busy-ness in general came over me, which distaste vanished when hunger set in and cold drove us back to Penzance.

But with the Flora-day came a fresh interest in it. The origin of the carnival is buried in mystery. No one knows whether the institution be due to the Druids, the Romans, or the old Spanish settlers on the Cornish coast. As there is no testimony to the contrary, either in tradition or common-sense, it is as well to award the prize in this competitorship, of which all parties are alike unconscious, to the oldest inhabitants, remoteness in the matter of time having as great a chance as in the matter of space, and sometimes lending an enchantment to the inauguration of a ceremonial which is found to be lacking in the celebration or continuance.

However this may be, there can be no doubt about the fact of the idea of the festival of Flora being a very pretty one. May is an early month in England for outdoor joyances. Easterly winds are apt to blow, and chilling showers apt to fall. But on this last eighth of May the weather-god was well inclined to those who came so far west expressly to see English people carry out an æsthetic idea.

There are three clearly-defined times and

three clearly-defined sets traditionally authorized to dance round and about the town like maniacs with a horticultural turn of madness on this day. The three hours for starting are five in the morning, an hour before noon, and three P.M. Each party of Terpsichoreans is preceded by a band playing the Flora dance—a lively, catching tune that hangs about the ear for days after it has happily ceased to sound on the fifes and drums. A tune that must have made the fame and fortune of some Druidical Jullien or Dan Godfrey, for every street-boy of antiquity must perforce have caught the haunting melody, and whistled it to the distraction of self and friends. The first set is composed of the servants, the second of the aristocracy of the neighborhood and town, and the third of the tradespeople. Each set follows the same route, starts from the same place, and eventually, after a fatiguing progress of nearly three hours' duration, returns to the same goal. The motive, and the manner which the motive compels them to adopt, equalizes the proceedings of the several sets, and causes them to resemble one another as closely as does one dinner-party in the domain of mediocre dullness and good society another. The progress of the aristocratic flock who started at eleven only differed from that of its predecessor in that there is less ghastliness in being gay at eleven than at five.

At about half past ten all those who intend taking part in the dance assemble at the Town Hall—the ladies to be chosen as partners, the gentlemen to choose. The rule of precedence is, that a "Helston bride shall lead, if there be one. If there be no bride the dance must be led by the lady of the highest rank present. Strangers come last." About forty couples started in this strange dance to the strange air, winding first through a bookseller's shop, then into the garden, and away into another street, and so on for about three miles, taking in their course all the principal private houses and shops in the town. All the public buildings are decorated with arches and trophies of evergreens and flowers. The windows of all the private houses are decked with blooms. The emblem flowers for the day are the tulip, the lily of the valley, and the rose; and these are worn wherever a flower can be placed. There is a great deal that is pretty and picturesque and poetical in the practice as well as in the theory of this quaint old custom. Still at times it seems to hang like a foreign garment upon its perpetuators, and lacks the complete abandonment to light-heartedness and flowery gayety which would mark it abroad. But be this as it may, it deserves wider knowledge and greater encouragement from strangers, for, such as it is, it stands alone, unsupported by any similar observance in England.

A BRAVE LADY.

BY THE AUTHOR OF "JOHN HALIFAX, GENTLEMAN."

With Illustrations.

CHAPTER I.

THE STORY.

I AM going back in my history of Lady de Bougainville nearly fifty years.

But before taking it up at that far-away period, so long before I knew her, and continuing it down to the time when I did know her—where I have just now let it drop—let me say a few words.

To give the actual full details of any human life is simply impossible. History can not do it, nor biography, nor yet autobiography; for, even if we wished, we could not tell the exact truth about ourselves. Paradoxical as it may sound, I have often thought that the nearest approximation to absolute truth is fiction; because the novelist presents, not so much literal facts, which can be twisted and distorted to almost any shape, as the one underlying verity of human nature. Thus Lady de Bougainville's story, as I have gradually gathered it from herself and others, afterward putting together all the data which came into my hands, is given by me probably as near reality as any one not gifted with clairvoyance could give it. I believe I have put "the facts of the case" with as much veracity as most historians. Nor am I bolder in discriminating motives and judging actions than many historians, nay, than we all often assume to be, just as if we were omnipresent and omniscient, toward our poor fellow-worms.

But still, any one with common-sense and common perception, studying human nature, must see that certain effects must follow certain causes, and produce certain final results, as sure as that the daylight follows the sun. Therefore when we writers make a story, and our readers speculate about it, and "wonder how it will end," we rather smile at them. We know that if it is true to human life it can end but in one way—subject to various modifications, but still only in one way. Granting such and such premises, the result must follow, inexorable as fate.

And so in course of years I arrived at Lady de Bougainville's history as accurately as if she herself had written it down: nay, more so, for upon various points of it her tongue was, and ever would have been, firmly sealed, while upon other points circumstances and her own peculiar character made her incompetent to form a judgment. But it was easy enough to form my own, less from what she related than by what she unwittingly betrayed, still more by what I

learned—though not till after she was gone—by the one only person who had known her in her youth, the old Irishwoman, Bridget Halloran, who then lived a peaceful life of busy idleness in Lady de Bougainville's house, and afterward ended her days as an honored inmate in mine.

Bridget, as soon as she knew me and grew fond of me, had no reserves; but her mistress had many. Never once did she sit down to relate to me her "history"—people do not do that in real life—and yet she was forever letting fall facts and incidents which, put together, made a complete and continuous autobiography. Her mind, ever dwelling on the past, and indifferent to, or oblivious of, the present, had acquired a vividness and minuteness of recollection that was quite remarkable. I never questioned her: that was impossible. At the slightest indication of impertinent curiosity she would draw in her horns, or retire at once into her shell like any hermit crab, and it was difficult to lure her out again. But generally, by simply listening while she talked, and putting this and that together by the light of what I knew of her character, I arrived at a very fair estimate of the total facts, and the motives which produced them.

Upon these foundations I have built my story. It is no truer and no falsier than our reproductions of human nature in history, biography, and romance usually are, and as such I leave it. The relation harms no one. And it will be something if I can snatch out of the common oblivion of women's lives—I mean women who die the last of their race, "and leave the world no pattern"—the strange, checkered life of my dear Lady Bougainville.

And so to begin:

More than half a century ago the Rev. Edward Scanlan came to be curate of the parish in the small West of England town of Ditchley St. Mary's, commonly called Ditchley only.

At that time the Establishment—especially as it existed in the provinces—was in a very different condition from what it is at present. "Orthodoxy" meant each clergyman doing that which was right in his own eyes, as to rubric, doctrine, or clerical government; that is, within certain limits of sleepy decorum and settled common usage. Beyond the pale of the Church there existed a vague dread of the Pope on one side, and Dissent on the other; and people had a general consciousness that the Establishment alone was really "respectable" to belong to; but within its boundary all went smoothly

enough. Low-Church, High-Church, Broad-Church, were terms unknown. There was not sufficient earnestness to create schism. One only section of new thinkers had risen up, originating with young Mr. Simeon of Cambridge, who either called themselves, or were called, "Evangelicals," and spoke much about "the gospel," which the more ardent of them fancied that they and they alone had received, and were commissioned to preach. This made them a little obnoxious to their old-fashioned brethren; but still they were undoubtedly a set of very earnest, sincere, and hard-working clergymen, whose influence in the English; and more particularly the Irish Church, was beginning to be clearly felt; only it did not extend to such remote parishes as that of Ditchley.

The Ditchley rector was a clergyman of the old school entirely. When still a young man he was presented to the living through family influence, and had fulfilled its duties decently, if rather grudgingly, his natural bias being in a contrary direction, and his natural disposition being from this or some other reason correspondingly soured. He was a man of education and taste; had traveled much on the Continent when he was only a younger brother, and before it was expected that he would have dropped in, as he did, late in life, for the whole accumulation of the family property—alas! rather too late; for by that time Henry Oldham was a confirmed old bachelor.

Since then he had crept on peacefully to septuagenarianism, the last of his race. He never went to live at Oldham Court, but let it to strangers, and kept on his modest establishment at the Rectory, which was a very pretty place, having once been a monastery, with a beautiful garden, in which he greatly delighted, and over which he was said to spend extravagant sums. Otherwise he lived carefully, some thought penuriously, but he was charitable enough to the poor of his parish; and he read prayers now and then, and preached a sermon, fifteen minutes long, regularly once a month; which comprised for him the whole duty of a clergyman.

I have seen Mr. Oldham's portrait, engraved after his death by the wish of his parishioners. He is represented sitting at his library-table, in gown and bands. His sermon lies before him, and he has the open Bible under his right hand, as in the portrait of the Reverend Sir Edward de Bougainville. But he is very unlike that admired individual, being a little spare old man, with a funny scratch wig, and a keen, caustic, though not unkindly expression; more like a lawyer than a clergyman, and more like a country gentleman than either.

Except this monthly sermon, and his necessary charities, which were no burden to him—Mr. Oldham being, as has been said, a very wealthy man, though nobody knew the precise amount of his wealth—the rector left all his parish responsibilities to his curate, whom he had picked up, during one of his rare absences from home, soon after his former assistant in

the duty—a college chum nearly as old as himself—died.

How such a strong contrast as the Reverend Edward Scanlan ever succeeded the Reverend Thomas Heavisides was a standing wonder to Ditchley. He was young, handsome, and an Irishman, belonging to that section of the Irish Church which coincided with the English "Evangelicals," except that in Ireland they added politics to religion, and were outrageously and vehemently "Orange"—a term of which, mercifully, the present generation has almost forgotten the meaning.

Mr. Scanlan had been, in his native country, as Ditchley soon discovered—for he had no hesitation in betraying the fact—a popular preacher. Indeed, his principal piece of furniture in his temporary lodgings was his own portrait in that character, presented to him just before he left Dublin—and he maintained the credit of a popular preacher still. On his very first Sunday he took the parish by storm. He literally "roused" the congregation, who were accustomed to do nothing but sleep during the sermon. But no one could sleep during that of the new curate. He preached extempore, which of itself was a startling novelty, alarming the old people a little, but delighting the younger ones. Then his delivery was so loud and energetic: he beat the pulpit cushion so impressively with his white ringed hand; and his sentences rolled off with such brilliant fluency. He never paused a moment for a word—ideas nobody asked for; and his mellifluous Irish accent sounded so original, so charming! His looks too—his abundance of black hair and large blue-black eyes—Irish eyes—which he knew how to make the very most of. Though he was short of stature and rather stumpy in figure compared to the well-grown young Saxons about Ditchley, still all the Ditchley ladies at once pronounced him "exceedingly handsome," and disseminated that opinion accordingly.

On the top of it—perhaps consequent upon it—came, after a Sunday or two, the further opinion, "exceedingly clever." Certainly Mr. Scanlan's sermons were very unlike any thing ever before heard in Ditchley. He seized upon sacred subjects in a dashing, familiar way—handled them with easy composure; illustrated them with all sorts of poetical similes, taken from every thing in heaven and earth; smothered them up with flowers of imagery—so that the original thought, if there was any at all, became completely hidden in its multiplicity of adornments.

Sometimes, in his extreme volubility of speech, Mr. Scanlan used illustrations whose familiarity almost approached the ludicrous, thereby slightly scandalizing the sober people of Ditchley. But they soon forgave him; when a man talks so much and so fast, he must make slips sometimes—and he was so pleasant in his manner, so meekly subservient to criticism, or so calmly indifferent to it, that

it soon died away; more especially as the rector himself had the good taste and good feeling never to join in any thing that was said either for or against his curate. In which example he was followed by the better families of the place—staunch old Tories, with whom a clergyman was a clergyman, and not amenable to the laws which regulate common men. They declared that whoever Mr. Oldham chose was sure to be the right person, and were perfectly satisfied.

Mr. Oldham was satisfied too, or at least appeared so. He always showed Mr. Scanlan every possible politeness, and professed himself perfectly contented with him—as he was with most things that saved himself from trouble. He had had in his youth a hard, in his age an easy life; and if there was one thing he disliked more than another, it was taking trouble. The Irish exuberance of Mr. Scanlan filled up all gaps, socially as well as clerically, and lifted the whole weight of the parish from the old man's shoulders. So, without any foolish jealousy, Mr. Oldham allowed his charming young curate to carry all before him; and moreover gave him a salary which, it was whispered, was far more than Mr. Heavisides had ever received; nay, more than was given to any curate in the neighborhood. But then Mr. Scanlan was so very superior a preacher; and (alas! for the Ditchley young ladies when they found it out) he was already a married man.

This last fact, when it leaked out, which it did not for a week or two, was, it must be owned, a considerable blow. The value of the new curate decreased at once. But Ditchley was too dull a place, and the young Irishman too great a novelty, for the reaction to be very serious. So, after a few cynical remarks of the sour-grape pattern, as to how very early and imprudently he must have married—the Irish always did—how difficult he would find it to keep a wife and family on a curate's income, and how very inferior a person the lady would probably be—Mr. Scanlan's star again rose, and he was generally accepted by the little community.

It is a mistake to suppose that the Irish are unappreciated in England—especially provincial England. Often the slow, bovine, solid Briton is greatly taken by the lively-tempered, easy, mercurial Celt, who both supplies a want and creates an excitement. A gentlemanly, clever, and attractive young Hibernian will drop suddenly down upon an old-fashioned English country town, amuse the men, captivate the women, and end by putting his bridle on the neck of ever so many of these mild, stolid agricultural animals—leading them by the nose completely for a little while—as did the gentleman who had just made his appearance in Ditchley. For weeks nothing was talked of but the Reverend Edward Scanlan—his brilliant preaching, his good looks, his agreeable manners. Every girl in the town would have been in love with him but for that uncomfortable im-

pediment, his wife. Great was the speculation concerning her—what kind of person she was likely to be. Imagination had full time to develop itself: for the curate occupied his lodgings alone for three months, during which time—as he confidentially, and not without much anxious and husband-like feeling, told the matrons of the place—Mrs. Scanlan was awaiting at his mother's house in Dublin the birth of their second child.

Then he had a mother, and she had a house; two facts which, in the paucity of information concerning him, were eagerly seized upon and discussed exhaustively. Indeed these conjugal confessions seemed to open to the young man all the maternal arms in Ditchley—Ditchley town, that is. The county families still hung back a little, pausing till they could discover something certain about Mr. Scanlan's antecedents.

This was not easy. Fifty years ago London itself was very far off from the West of England, and Ireland seemed a *terra incognita*, as distant as the antipodes. Nor, except letting fall in his conversation a good many titled names, which were recognized as belonging to the religious aristocracy of the period, did Mr. Scanlan say much about his family or connections. He was apparently that odd mixture of candor and secretiveness which is peculiarly Celtic—Highland and Irish. While voluble enough concerning himself personally, of his wife, his parents, and his relatives generally—who could not have been numerous, as he was an only child—he said remarkably little.

It is a curious fact, and a contradiction to certain amusing legal fictions concerning the conjugal estate, that whatever a man may be, and however great a personage theoretically, practically his social status is decided by his wife. Not so much by *her* social status or origin, as by the sort of woman she is in herself. King Cophetua may woo the beggar-maid, and if she has a queenly nature she will make an excellent queen; but if he chooses a beggar in royal robes they will soon drop off, and the ugly mendicant appear; then King Cophetua may turn beggar, but she will never make a queen. And so, in every rank of life, unless a man chooses a woman who is capable of keeping up at home the dignity which he labors for in the world, he will soon find his own progress in life sorely hampered and impeded, his usefulness narrowed, his honors thrown away.

Mr. Scanlan was no doubt a very charming man—quite the gentleman, every body said; and his tastes and habits were those of a gentleman, at least of a person who has been well off all his life. Indeed, he every where gave the impression of having been brought up in great luxury as a child, with ponies to ride, unlimited shooting and fishing, etc.—the sort of life befitting a squire's son; on the strength of which, though a clergyman, he became hand in glove with all the rollicking squires' sons round about.

Ditchley puzzled itself a little concerning his name. Scanlan did not sound very aristocratic, but then English ears never appreciate Irish patronymics. The only time that any one in this neighborhood had ever seen it—(the fact was breathed about tenderly, and never reached the curate)—was upon a stray porter-bottle—"Scanlan and Co.'s Dublin stout"—but that might have been a mere coincidence; no doubt there were many Scanlans all over Ireland. And even if it were not so—if Mr. Scanlan did really belong to the "stout" family—what harm was it? Who had not heard of illustrious brewers? Whitbread in England, Guinness in Ireland—were they not names high in honor, especially among the religious world of the day—the Evangelical set, which, however the old-fashioned, easy-going church people might differ from it, had undoubtedly begun to work a great revolution in the Establishment?

Mr. Scanlan belonged to it, and evidently glorified himself much in the fact. It was such an exceedingly respectable section of the community: there were so many titled and wealthy names connected with it; even a poor curate might gather from his alliance therewith secondary honor. Nevertheless, the county society, which was very select, and not easily approachable, paused in its judgment upon the Reverend Edward Scanlan until it had seen his wife. Then there was no longer any doubt concerning him.

I should think not! I could imagine how she looked the first time she appeared in public, which was at church, for she arrived at Ditchley on a Saturday—arrived alone with her two babies—both babies, for one was just fifteen months the elder of the other—and their nurse, a thorough Irishwoman, very young, very untidy, very faithful, and very ugly. Well could I picture the curate's wife as she walked up the aisle—though perhaps her beauty would at first be hardly perceptible to these good Ditchley people, accustomed to fair Saxon complexions, plump figures, and cheeks rosy and round, whereas hers were pale and thin, and her eyes dark, with heavy circles underneath them. Besides, she was very tall, and slender almost to tenuity; and her early maternity, combined with other cares, had taken from her the first fresh bloom of youth. At nineteen she looked rather older than her husband, though he was her senior by some years. "What a pity!" Ditchley said, in its comments upon her that Sunday; "why will Irishwomen marry so young?"—until they found out she was not an Irishwoman at all.

What she was, or where she came from, they had at first no means of guessing. She spoke English perfectly. Nevertheless, as the ladies who called upon her during the ensuing week detected, she had certainly some sort of foreign accent; but whether French, German, or Spanish, the untraveled natives of Ditchley were quite unable to discover. And even the boldest and most inquisitive of them found—I can

well believe it!—a certain difficulty in putting intrusive questions, or indeed questions of any kind, to Mrs. Scanlan. They talked about her babies, of whom she seemed irrationally proud; about her husband, to whose praises she listened with a sweet, calm, appreciative smile; and then they went away, having found out about her just as much as they knew the week before—viz., that she was Mrs. Scanlan.

Nevertheless she burst upon Ditchley like a revelation; this beautiful, well-bred young woman, who, though only the curate's wife, living in very common furnished lodgings, seemed fully the equal of every lady who called upon her. Yet she made nobody uncomfortable. Those who came to patronize forgot to do it, that was all; while the poorer and humbler ones, who, from her looks at church, had been at first a little afraid of her—doubting she would be "stand-offish" and disagreeable—found her so pleasant that they were soon quite at their ease, and went away to trumpet her praises far and near.

While she—how did she receive this praise, blame, or criticism? Nobody could find out. She had all the simplicity and naturalness of one who takes no trouble to assert a position which she has had all her life; is quite indifferent to outside shows of wealth or consequence, possessing that within which is independent of either; easily accessible to all comers; considering neither "What do other people think of you?" nor "I wonder what you are now thinking of me?" but welcoming each and all with the calm, gentle graciousness of a lady who has been, to use the current phrase, "thoroughly accustomed to good society."

Such was the wife whom, much to their surprise after all—for in none of their speculations had they quite reckoned upon such a woman—the new curate introduced to the parish of Ditchley.

She settled his status there, at once and permanently. Nay, she did more, for, with her dignified candor, she explained at once the facts which he had hitherto kept concealed; not upon her neighbors' first visit, but as soon as she grew at all into friendliness with them, even expressing some surprise that neither Mr. Scanlan nor Mr. Oldham—who treated her with great respect, and even had a dinner-party at the Rectory in her honor—should have made public the very simple facts of the Scanlan family history. Her Edward's father was a wealthy Dublin brewer—the identical "Scanlan and Co."—who had brought his son up to the Church, and was just on the point of buying him a living when some sudden collapse in trade came, the firm failed, the old man died penniless, leaving his old wife with only her own small income to live upon, while the son was driven to maintain himself as best he could. Though he was a popular preacher, and very much sought after, still admiration brought no pounds, shillings, and pence; his fine friends slipped from him; no hope of preferment offered itself in

Ireland. At which conjuncture he met Mr. Oldham, made friends with him, and accepted a fat curacy in the land of the Saxons.

This was the whole—a very plain statement, involving no mystery of any kind. Nor concerning herself was there ought to disguise. When her peculiar accent, and certain foreign ways she had, excited a few harmless wonderings, Mrs. Scanlan satisfied them all in the briefest but most unhesitating way, telling how she was of French extraction, her parents being both of an old Huguenot family, belonging to the *ancienne noblesse*. This latter fact she did not exactly state until her visitors noticed a coronet on an old pocket-handkerchief; and then she answered, quite composedly, that her late father, a teacher in Dublin, and very poor, was the Vicomte de Bougainville.

Here at once I give the clew to any small secret which may hitherto have thrown dust in the reader's eyes, but I shall attempt this no more. It must be quite clear to all persons of common penetration who was the lady I am describing.

Mademoiselle Josephine de Bougainville was the only child of her parents, who had met and married late in life, both being poor *émigrés* belonging to the same family, driven from France by the first Revolution. The mother was already dead when Josephine was given, at the early age of sixteen, to Edward Scanlan. I think, in spite of many presumptions to the contrary, that undoubtedly she married him from love, as he her. Perhaps, considering her extreme youth and her French bringing up, it was not exactly the right sort of love—not the love which we like to see our English daughters marry with, quite independent of the desire of parents or friends, trusting to no influence but that of their own honest hearts; but still it was love, and Edward Scanlan, a good-looking, ardent, impulsive young fellow, was just the sort of lover that would be attractive to sweet sixteen. I believe he fell in love with her at church, violently and desperately; and his parents, who never said him nay in any thing, and who had the shrewdness to see that her beauty and her good birth formed an excellent balance to the Scanlan money—nay, would be rather an advantage to the same—instead of resisting, encouraged the marriage. They applied to M. de Bougainville for his daughter's hand, and the poor old Vicomte, starving in his garret, was glad enough to bestow it—to see his child safe settled in a home of her own, and die.

He might have used some persuasion; she might have thought, French fashion, that it was right to marry whomsoever her father wished, and so bent her will cheerfully to his. But I am sure she did not marry against her will, from the simple fact that, to a nature like hers, a marriage without love, or for any thing except love, would have been, at any age, altogether impossible. Besides, I have stronger evidence still. Once, in discussing, with re-

gard to myself, this momentous question, Lady de Bougainville said to me, very solemnly—so solemnly that I never forgot her words:

"Remember, Winifred, love alone is not sufficient in marriage. But, wanting love, nothing else suffices—no outward suitability, no tie of gratitude or duty. All break like threads before the wrench of the ever-grinding wheel of daily cares. I had a difficult married life, my dear, but it would have been ten times more so if, when I married, I had not loved my husband."

I find that instead of telling a consecutive story, I am mixing up confusedly the near and the far away. But it is nearly impossible to avoid this. Many things, obviously, I have to guess at. Given the two ends of a fact I must imagine the middle; but I shall imagine as little as ever I can. And I have two clews to guide me through the labyrinth—clews which have never failed through all those years.

Every Saturday night, when her children were in bed, her week's duties done, and her husband arranging his sermon, a task he always put off till the last minute, sitting up late to do it—and she never went to bed until he was gone, and she could shut up the house herself—this quiet hour Mrs. Scanlan always devoted to writing a journal. It was in French, not English; and very brief: a record of facts, not feelings; events, not moralizings: but it was kept with great preciseness and accuracy. And, being in French, was private; since, strange to say, her husband had never taken the trouble to learn the language.

Secondly, Lady de Bougainville had one curious superstition: she disliked burning even the smallest scrap of paper. Every letter she had ever received she kept arranged in order, and ticketed with its date of receipt and the writer's name. Thus, had she been a celebrated personage, cursed with a biographer, the said biographer would have had no trouble at all in arranging his data and gathering out of them every possible evidence, except perhaps the truth, which lies deeper than any external facts. Many a time I laughed at her for this peculiarity of hers; many a time I declared that were I a notable person I would take care to give those who came after me as much trouble as possible: instituting such periodical incinerations as would leave the chronicler of my life with no data to traffic upon, but keep him in a state of wholesome bewilderment concerning me. At which Lady de Bougainville only smiled, saying, "What does it matter? Why need you care?"

It may be so. As we decline toward our end, the projected glory and peace of the life to come may throw into dimness all this present life: we may become indifferent to all that has happened to us, and all that people may say and think of us after we are gone. She did, I know. And I might feel the same myself, if I had no children.

Those two children of hers, the little girl and

"THIS QUIET HOUR MRS. SCANLAN DEVOTED TO WRITING A JOURNAL."

boy, were enough of themselves to make life begin brightly for young Mrs. Scanlan, even in the dull town of Ditchley. And it was the bright time of year, when Ditchley itself caught the reflected glow of the lovely country around it—rich, West of England country; wide, green, heaving pasture-lands, and lanes full of spring flowers. The first time her little César came home with his chubby hands holding, or rather dropping, a mass of broken blue hyacinths, his mother snatched him in her arms and smothered him with kisses. She felt as if her own childhood were come over again in that of her children.

Besides, the sudden collapse of fortune, which had brought so many changes, brought one blessing, which was a very great one to Josephine Scanlan. Hitherto the young couple had never had a separate home. The old couple, considering—perhaps not unwisely—that the wife was so young and the husband so thoughtless, and that they themselves had no other children, brought them home to live with them in their grand house; which combined establishment had lasted until the crash came.

It could scarcely have been a life altogether to Josephine's taste; though I believe her father and mother-in-law were very worthy people—quite uneducated, having "made themselves," but gentle, kind, and good. If ever she did speak of them it was always with tenderness. Still, to the poor *émigrés'* daughter, brought up in all the traditions of "blue blood;" taught to take as her standard of moral excel-

lence the chivalry which holds honor as the highest good, and socially, to follow that perfect simplicity which indicates the truest refinement—to such a one there must always have been something jarring in the rude, lavish luxury of these *nouveaux riches*, who, being able to get any thing through their money, naturally concluded that money was every thing. Though her fetters were golden, still, fetters they were: and though she must have worn them with a smiling, girlish grace—she was so much of a child, in years and in character—yet I have no doubt she felt them sometimes. When, all in a day, they dropped off like spiders' webs, I am afraid young Mrs. Scanlan was not near so unhappy as she ought to have been; nay, was conscious of a certain sense of relief and exhilaration of spirits. It was like passing out of a hot-house into the free pure air outside; and, though chilling at first, the change was wonderfully strengthening and refreshing.

The very first shock of it had nerved the shy, quiet girl into a bright, brave, active woman, ready to do all that was required of her, and more; complaining of nothing, and afraid of nothing. Calmly she had lived on with her mother-in-law, amidst the mockeries of departed wealth, till the house and furniture at Merri-on Square could be sold; as calmly, in a little lodging at Kingstown, had she waited the birth of her second child; and then, with equal fearlessness, had traveled from Ireland with the children and Bridget, alone and unprotected, though it was the first time in her life she had

ever done such a thing. But she did it thankfully and happily; and she was happy and thankful now.

True, neither Mr. nor Mrs. Scanlan felt at first the full weight of their changed fortunes. The grand sweep of every thing had not been so complete, or else it had been managed so ingeniously—as wide-awake people can manage these little affairs—as to leave them out of the wreck a good many personal luxuries. By the time the picturesque little cottage—which, being on the rector's land, he had put into good repair and recommended as a suitable habitation for his curate—was ready, there arrived by sea, from Dublin, quite enough of furniture—the remnant of old splendors—to make it very comfortable; nay, almost every lady, in paying the first call upon Mrs. Scanlan at Wren's Nest, said, admiringly, "What a pretty home you have got!"

Then when Mrs. Scanlan returned the visits, and, the term of mourning for her parents-in-law having expired, accepted a few invitations round about, she did so in clothes which, if a little unfashionable in Dublin, were regarded as quite modern in Ditchley; garments so handsome, so well arranged, and so gracefully put on that some of his confidential matron friends said to Mr. Scanlan, "How charmingly your wife dresses! Any one could see she was a Frenchwoman by the perfection of her toilet." At which Mr. Scanlan was, of course, excessively delighted, and admired his beautiful wife more than ever because other people admired her so much.

He, too, was exceedingly "jolly"—only that word had not then got ingrafted in the English language—in spite of his loss of fortune. The result of it did not as yet affect him personally; none of his comforts were curtailed to any great extent. "Roughing it" in lodgings, with every good house in the parish open to him whenever he chose to avail himself of the hospitality, had been not such a very hard thing. Nor was "love in a cottage," in summer-time, with roses and jasmines clustering about the door, and every body who entered it praising the taste and skill of his wife, within and without the house, and saying how they envied such a scene of rural felicity, by any means an unpleasant thing.

In truth, the curate sometimes scarcely believed he was a poor man at all, or in anywise different from the Edward Scanlan with whom every thing had gone so smoothly since his cradle, for his parents having married late in life had their struggle over before he was born. He still dressed with his accustomed taste—a little florid, perhaps, but not bad taste; he had always money in his pocket, which he could spend or give away, and he was equally fond of doing both. He had not, naturally, the slightest sense of the individual or relative value of either sovereigns or shillings, no more than if they had been dead leaves. This peculiarity had mattered little once, when he was

a rich young fellow; now, when it did matter, it was difficult to conquer.

His mother had said to Josephine on parting—almost the last thing she did say, for the old woman died within the year—"Take care of poor Edward, and look after the money yourself, my dear, or it'll burn a hole in his pockets—it always did." And Josephine had laughed at the phrase with an almost childish amusement and total ignorance of what it meant and implied. She understood it too well afterward.

But not now. Not in the least during that first sunshiny summer, which made Ditchley so pleasant and dear to her that the charm lasted through many and many a sunless summer and dreary winter. Her husband she had all to herself, for the first time; he was so fond of her, so kind to her; she went about with him more than she had ever been able to do since her marriage; taking rambles to explore the country, paying amusing first visits together to investigate and criticise the Ditchley society; receiving as much attention as if they were a new married couple; and even as to themselves, having as it were their honey-moon over again, only a great deal more gay and more comfortable. It was indeed a very happy life for Mr. and Mrs. Scanlan.

As for the babies, they were in an earthly paradise. Wren's Nest was built among the furze-bushes of a high common, as a wren's nest should be; and the breezes that swept over were so fresh and pure that the two little delicate faces soon began to grow brown with health—César's especially. The infant, Adrienne, had always been a small fragile thing. But César grew daily into a real boy, big, hearty, and strong; and Bridget showed him off wherever she went as one of the finest children of the neighborhood.

Thus time went on, marching upon flowers; still he did march, steadily, remorselessly. But it was not till the fall of the year, when a long succession of wet days and weeks made Wren's Nest look—as a wren's nest might be expected to look in wintry weather—that the Scanlans woke up to the recollection that they were actually "poor" people.

CHAPTER II.

WHAT are "poor" people—such as I have just stated the curate of Ditchley and his wife to be?

Few questions can be more difficult to answer. "Poor" is an adjective of variable value. I compassionate my next neighbor as a "poor" woman, because she lives in a small tumble-down cottage at the end of my garden, and has nine children, and a sick husband. While my next neighbor but one, who drives about in her carriage and pair, no doubt compassionates me, because in all weathers I have to go on foot. Often when she sweeps past me, trudging along our muddy lanes, and we bow and smile, I can

detect a lurking something, half pity—half—no, she is too kind for scorn!—in her face, which exceedingly amuses me. For I know that if her carriage meets the little chaise and ponies, driven by the lovely Countess whose seat is four miles off, the said Countess will be greatly envied by my wealthy neighbor, whose husband has only one handsome house to live in, while the Earl has six.

Thus, you see, “poor” is a mere adjective of comparison.

But when I call the Scanlans “poor,” it was because their income was not equal to their almost inevitable expenditure. Theirs was the sharpest form of poverty, which dare not show itself as such; which has, or thinks it has, a certain position to keep up, and therefore must continually sacrifice inside comforts to outside shows. How far this is necessary or right remains an open question—I have my own opinion on the subject. But one thing is certain, that a curate, obliged to appear as a gentleman, and mix freely in other gentlemen’s society—to say nothing of his having, unfortunately, the tastes and necessities of a gentleman—is in a much harder position than any artisan, clerk, or small shop-keeper who has the same number of pounds a year to live upon. Especially when both have the same ever-increasing family, only a rather different sort of family, to bring up upon it.

When Mr. Scanlan’s stock of ready-money—that “running account” in the Ditchley bank, which he had thought so inexhaustible, but which ran away as fast as a centipede before the year was out—when this sum was nearly at an end, the young husband opened his eyes wide, with a kind of angry astonishment. His first thought was, that his wife had been spending money a great deal too fast. This was possible, seeing she was still but a novice in house-keeping, and besides she really did not know how much she had to keep house upon. For her husband, proud of his novel dignity as master of a family, had desired her to “leave every thing to him—just ask him for what she wanted, and he would always give it to her: a man should always be left to manage his own affairs.” And Josephine, dutifully believing this, had smiled at the recollection of her mother-in-law’s caution, thinking how much better a wife knew her husband than his own parents ever did, and cheerfully assented. Consequently, she made not a single inquiry as to how their money stood, until there was no money left to inquire after.

This happened on a certain damp November day—she long remembered the sort of day it was, and the minutiae of all that happened on it; for it was the first slight lifting up of that golden haze of happiness—the first opening of her eyes unto the cold, cheerless land that she was entering; the land where girlish dreams and ideal fancies are not, and all pleasures that exist therein, if existing at all, must be taken after a different fashion, and enjoyed in a different sort of way.

Mr. Scanlan had gone into Ditchley in the forenoon, and his wife had been busy making all sorts of domestic arrangements for a change that would rather increase than diminish the family expenditure, and holding a long consultation with her one servant as to a little plan she had, which would lighten both their hands, and indeed seemed, with present prospects, almost a necessity.

For, hard-working woman as Bridget was—and when there is found an industrious, conscientious, tidy Irishwoman, how she will work! with all her heart in it too—still Wren’s Nest in winter and Wren’s Nest in summer were two very different abodes. You can not keep a little cottage as warm as a good-sized house, or as neat either, especially when the said little cottage has two little people in it just of the age when rich parents find it convenient to exile their children to safe nurseries at the top of the house, to be “out of the way.” Wren’s Nest, quite large enough when César and Adrienne were out on the common from morning till night, became small when the poor little things had to be shut up in it all day long. Their voices—not always sweet—sometimes rang through it in a manner that even their mother found rather trying. As to their father—but Mrs. Scanlan had already begun to guess at one fact, which all young married women have to discover—that the more little children are kept out of their father’s way the better for all parties.

Moreover, Josephine’s husband still enjoyed his wife’s company far too well not to grumble a little when she stinted him of it for the sake of her babies. He excessively disliked the idea of her becoming “a family woman,” as he called it, swallowed up in domestic cares. Why not leave all that to the servants? He still said “servants,” forgetting that there was now but one. Often, to please him—it was so sweet to please him always!—Mrs. Scanlan would resign many a necessary duty, or arrange her duties so that she could sit with him alone in the parlor, listening while he talked or read—listening with one ear, while the other was kept open to the sounds in the kitchen, where Bridget might be faintly heard, going about her work and crooning the while some Irish ditty, keeping baby on one arm while she did as much as she could of the household work with the other.

Poor Bridget! With all her good-will, of course, under such circumstances, things were not done as well as they ought to have been, nor were the children taken such care of as their anxious mother thought right. When there was a third child impending some additional household help became indispensable, and it was on this subject that she and Bridget were laying their heads together—very different heads, certainly, though the two young women—mistress and maid, were nearly the same age.

Let me pause for a moment to draw Bridget Halloran’s portrait—lovingly, for she was a great friend of mine.

She was very ugly, almost the ugliest woman I ever knew; and she must have been just the same in youth as in age, probably uglier, for time might by then have ironed out some of the small-pox seams which contributed not a little to the general disfigurement of her features. True, she never could have had much features to boast of, hers being the commonest type of Irish faces, flat, broad, round as an apple-dumpling, with a complexion of the dumpling hue and sodienness. There was a small dough-pinch for the nose, a wide slit for the mouth, two beady black-currants of eyes—and you had Bridget Halloran's face complete. Her figure was short and sturdy, capable of infinite exertion and endurance; but as for grace and beauty, not even in her teens did it possess one single line. Her sole charm was that peculiarly Hibernian one—a great mass of very fine blue-black hair, which she hid under a cap, and nobody ever saw it.

But Nature, which had been so niggardly to this poor woman in outward things, compensated for it by putting into her the brightest, bravest, truest, peasant nature—the nature of the Irish peasant who, being blessed with a double share of both heart and brains, is capable alike of any thing good and any thing bad. Bridget, no doubt, had her own capacities for the latter, but they had remained undeveloped; while all the good in her had grown, month by month, and day by day, ever since, at little César's birth, she came as nurse-maid into the service of young Mrs. Scanlan.

To her mistress she attached herself at once with the passionate admiration that ugliness sometimes conceives for beauty, coarseness for grace and refinement. And, they being thrown much together, as mothers and nurse-maids are, or ought to be, this admiration settled into the most faithful devotion that is possible to human nature. At any time, I think, Bridget would composedly have gone to be hanged for the sake of her mistress; or rather, dying being a small thing to some people, I think she would have committed for her sake any crime that necessitated hanging. Which is still not saying much, as Bridget's sole consciousness of, and distinction between, right and wrong was, whether or not Mrs. Scanlan considered it so.

But I have said enough to indicate what sort of person this Irish girl was, and explain why the other girl—still no more than a girl in years, though she was mistress and mother—held toward her a rather closer relation than most ladies do with their servants nowadays. Partly, because Bridget was of Irish, and Mrs. Scanlan of French birth, and in both countries the idiosyncrasy of the people makes the tie between the server and the served a little different from what it is in England. Also, because the enormous gulf externally between Josephine Scanlan *née* De Bougainville, and Bridget Halloran, nobody's daughter (being taken from a foundling hospital), was crossed easier than many lesser distances, especially by that

slender, firm, almost invisible, but indestructible bond of a common nature—a nature wholly womanly. They understood one another, these two, almost without a word, on the simple ground of womanhood.

They were discussing anxiously the many, and to them momentous arrangements for the winter, or rather early spring—the new-comer being expected with the violets—but both servant and mistress had quite agreed on the necessity of a little twelve-year-old nurse-maid, and had even decided on the village school girl whom they thought most suitable for the office. And then Bridget, seeing her mistress look excessively tired with all her morning's exertions, took the children away into the kitchen, and made their mother lie down on the sofa underneath the window, where she could see the line of road across the common, and watch for Mr. Scanlan's return home.

She was tired, certainly; weary with the sacred weakness, mental and bodily of impending maternity, but she was neither depressed nor dejected. It was not her nature to be either. God had given her not only strength, but great elasticity of temperament; she had been a very happy-hearted girl as Josephine de Bougainville, and she was no less so as Josephine Scanlan. She had had a specially happy summer—the happiest, she thought, since she was married; her husband had been so much more her own, and she had enjoyed to the full the pleasure of being sole mistress in her own house, though it was such a little one. I am afraid, if questioned, she would not for one moment have exchanged Wren's Nest for Merriion Square.

Nor—equal delusion!—would she have exchanged her own husband, the poor curate of Ditchley, for the richest man alive, or for all the riches he had possessed when she first knew him. She was very fond of him just as he was. She greatly enjoyed his having no valet, and requiring her to wait upon him hand and foot; it was pleasanter to her to walk across the country, ever so far, clinging to his arm, than to be driven along in state, sitting beside him in the grand carriage. And beyond expression sweet to her were the quiet evenings which had come since the winter set in, when no dinner parties were possible, and after the children were gone to bed the young father and mother sat over the fire, as close together as lovers, and making love quite as foolishly sometimes.

"I suspect, after all, I was made to be a poor man's wife," Josephine would sometimes say to herself, and think over all her duties in that character, and how she could best fulfill them, so that her Edward might not miss his lost riches the least in the world, seeing he had gained, as she had, so much better things.

She lay thinking of him on this wise, very tenderly, when she saw him come striding up to the garden-gate; and her heart beat quicker, as it did still—foolish, fond creature!—at the sight of her young husband—her girlhood's

"SHE LAY THINKING OF HIM ON THIS WISE, TENDERLY."

love. She made an effort to rise and meet him with a bright face and open arms.

But his were closed, and his countenance was dark as night—a very rare thing for the good-tempered, easy-minded Edward Scanlan.

"What is the matter, dear? Are you ill? Has any thing happened?"

"Happened, indeed! I should think so! Do you mean to say you don't know—that you never guessed? Look there!"

He threw over to her one of those innocent-looking, terrible little books called bank-books, and went and flung himself down on the sofa in exceeding discomposure.

"What is this?"—opening it with some curiosity, for she had never seen the volume before; he had kept it in his desk, being one of those matters of business which, he said, "a woman couldn't understand."

"Nonsense, Josephine! Of course you knew."

"What did I know?"

"That you have been spending so much money that you have nearly ruined me. Our account is overdrawn."

"Our account overdrawn! What does that mean?" she said—not answering, except by a gentle sort of smile, the first half of his sentence. For she could not have been married these five years without learning one small fact—that her Edward sometimes made "large" statements, which had to be received *cum grano*, as not implying more than half he said, especially when he was a little vexed.

"Mean! It means, my dear, that we have not a half-penny left in the bank, and that we owe the bank two pounds five—no, seven—I never can remember those stupid shillings!—over and above our account."

"Why did they not tell you before?"

"Of course they thought it did not matter. A gentleman like me would always keep a banker's account, and could at any time put more money in. But I can't. I have not a penny-piece in the world besides my paltry salary. And it is all your fault—all your fault, Josephine."

Mrs. Scanlan was startled. Not that it was the first time she had been spoken to crossly by her husband: such an idyllic state of con-

cord is quite impossible in ordinary married life, and in this work-a-day world, where men's tempers, and women's too, are rubbed up the wrong way continually; but he had never spoken to her with such sharp injustice. She felt it acutely; and then paused to consider whether it were not possible that Edward was less to blame than she. For she loved him; and, to fond, idealizing love, while the ideal remains unbroken, it is so much easier to accuse one's self than the object beloved.

"It may be my fault, my friend"—she often called him, affectionately, "my friend," as she remembered hearing her mother address her father as "*mon ami*," and it was her delight to think that the word was no misnomer—every woman's husband should be, besides all else, her best, and dearest, and closest "friend." "But if it is my fault I did not mean it, Edward. It was because I did not understand. Sit down here, and try to make me understand."

She spoke quite cheerfully, not in the least comprehending how matters stood, nor how serious was the conjuncture. When it dawned upon her—for, though so young and inexperienced, she had plenty of common-sense, and a remarkably clear head at business—she looked extremely grave.

"I think I do understand now. You put all the money we had, which was a hundred pounds, into the bank, and you have fetched it out for me whenever I asked you for it, or whenever you wanted some yourself, without looking how the account stood—the 'balance,' don't you call it?—and when you went to the bank to-day, you found we had spent it all, and there was nothing left. Isn't that it?"

"Exactly so. What a sharp little girl you are; how quickly you have taken it all in!" said he, a little more good-tempered, having got rid of his crossness by its first ebullition, and being relieved to find how readily she forgave it, and how quietly she accepted the whole thing. For he had a lurking consciousness that, on the whole, he had been a little "foolish," as he called it himself, and was not altogether free from blame in the transaction.

"Yes, I think I have taken it all in," said she, meditatively, and turning a shade paler. "I comprehend that the money I wanted I can not get; that we shall be unable to get any more money for any thing until Mr. Oldham pays you your next half-yearly salary."

"Just so. But don't you vex yourself, my love. It will not signify. We can live upon credit; my father lived upon credit for I don't know how long."

Josephine was silent—through sheer ignorance. Her translation of the word "credit" was moral virtue, universal respect: and she liked to think how deeply her husband was respected in the town; but still she did not understand how his good name would suffice to pay his butcher's and baker's bills, and other expenses, which seemed to have fallen upon

them more heavily than usual this Christmas. To say nothing of another expense—and a strange pang shot through the young mother's heart, to think that it should ever take the shape of a burden instead of a blessing—the third little olive-branch that was soon to sprout up round that tiny table.

"Edward," she said, looking at him entreatingly—almost tearfully, as if a sudden sense of her weakness had come upon her, and instinctively she turned to her husband for help: "Edward, tell me, if we can get no money, not till May, from Mr. Oldham, what am I to do—in March?"

"Bless my soul, I had forgotten that!" and the young man spoke in a tone of extreme annoyance. "You should have thought of it yourself; indeed, you should have thought of every thing a little more. March! how very inconvenient. Well, it can't be helped. You must just manage as well as you can."

"Manage as well as I can," repeated Josephine, slowly, and lifted up in his face her great, dark, heavy eyes. Perhaps she saw something in that face which she had never seen before, some line which implied it was a weaker face, a shallower face than at first appeared. She had been accustomed to love it without reading it much—certainly without criticising it; but now her need was hard. Still harder, too, when wanting it most, to come for comfort and find none; or, at least, so little that it was almost none. "He does not understand," she said to herself, and ceased speaking.

"It is very, very provoking, altogether most unfortunate," continued the curate. "But I suppose you can manage, my dear; laborers' wives do with half the comforts that I hope you will have. Oh dear, a poor curate is much worse off than a day-laborer! But as to the little nurse-maid you were speaking to me about this morning, of course you will see at once that such an additional outlay would be quite impossible. She would eat as much as any two of us; and, indeed, we shall have quite enough mouths to fill—rather too many."

"Too many!"

It was but a chance word, but it had stabbed her like a sword—the first actual wound her husband had ever given her. And, by nature, Josephine Scanlan was a woman of very acute feelings, sensitive to the slightest wound; not to her pride, or her self-esteem, but to her affections and her strong sense of right and justice. She answered not a syllable; she turned away quietly—and stood looking out of the window toward where Ditchley church-spire rose through the rainy mist. Then she thought, with a sudden, startling fancy, of the church-yard below it, where a grave might open yet—a grave for both mother and babe—and so save the little household from being "too many."

It was an idea so dreadful, so wicked, that she thrust it from her in haste and shame, and turned back to her husband, trying to speak in a cheerful voice of other things.

"But what about the two pounds five, or seven—which is it?—that you owe the bank? Of course we must pay it."

"Oh no, they will trust me; they know I am a gentleman."

"But does not a gentleman always pay? My father thought so. Whatever comforts we went without, if the landlord came up for our rent it was ready on the spot. My father used to say, '*Noblesse oblige.*'"

"Your father," began Mr. Scanlan, with a slight sneer in his tone, but stopped. For there stood opposite to him, looking at him with steadfast eyes, the poor Vicomte's daughter, the beautiful girl he had married—the woman who was now his companion for life, in weal or woe, evil report or good report. She might not have meant it—probably was wholly unconscious of the fact—but she stood more erect than usual, with all the blood of the De Bougainvilles rising in her thin cheeks and flaming in her sunken eyes.

"I should not like to ask the bank to trust us, Edward; and there is no need. I paid all my bills yesterday for the month, but there are still three sovereigns left in my purse. You can take them and pay. Will you? At once?"

"There is no necessity. What a terrible hurry you are in! How you do bother a man! But give me the money."

"Edward!" As he snatched at the offered purse, half jest, half earnest, she detained him. "Kiss me! Don't go away angry with me. We are never surely beginning to quarrel?"

"Not a bit of it. Only—well, promise to be more careful another time."

She promised, almost with a sense of contrition, though she did not exactly know what she had to repent of. But when her husband was gone up stairs, and she lay down again, and began calmly thinking the matter over, her sense of justice righted itself, and she saw things clearer—alas! only too clear.

She knew she had erred, but not in the way Edward thought: in quite a contrary direction. How could she, a mistress and mother of a family, have been so unwise as to take every thing upon trust, live merrily all that summer, supplying both herself and the household with every thing they needed, without inquiring a syllable about the money; where it all came from, how long it would last, and whether she was justified in thus expending it!

"Of course, Edward did not think, could not calculate—it was never his way. His poor mother was right; this was my business, and I have neglected it. But I was so ignorant. And so happy—so happy!"

Her heart seemed to collapse with a strange, cold fear—a forewarning that henceforward she might not too often have that excuse of happiness. It was with difficulty that she restrained herself before her husband; and the minute he had left her—which he did rather carelessly, and quite satisfied she was "all right now"—

she burst into such hysterical sobbing that Bridget in the kitchen heard and came in.

But when, with fond Irish familiarity, the girl entreated to know what was the matter, and whether she should run and fetch the master, Mrs. Scanlan gave a decided negative, which surprised Bridget as much as these hysterical tears.

Bridget and her master were not quite upon as good terms as Bridget and her mistress. Mr. Scanlan disliked ugly people; also, he treated servants generally with a certain roughness and lordliness, which some people think it necessary to show, just to prove the great difference between them and their masters, which otherwise might not be sufficiently discernible.

But when she saw him from the window striding across the common toward Ditchley, leaving the house and never looking behind him, though he, and he only, must have been the cause of his wife's agitation, either by talking to her in some thoughtless way, or telling her some piece of bad news which he ought to have had the sense to keep to himself, Bridget felt extremely angry with Mr. Scanlan.

However, she was wise enough to hold her tongue, and devote all her efforts to soothe and quiet her mistress, which was finally effected by a most fortunate domestic catastrophe; César and little Adrienne being found quarreling over the toasting-fork which Bridget had dropped in her hurry, and which was so hot in the prongs that both burned their fingers, and tottered screaming to their mother's sofa. This brought Mrs. Scanlan to herself at once. She sat up, cuddled them to her bosom, and began comforting them as mothers can—by which she soon comforted herself likewise. Then she looked up at Bridget, who stood by her, silent and grim—poor Bridget's plain face was always so very grim when she was silent—and made a half excuse or apology.

"I can't think what made me turn so ill, Bridget. I have been doing almost nothing all day."

"Doing! No, ma'am, it's not doing, it's talking," replied Bridget, with a severe and impressive emphasis, which brought the color to her mistress's cheeks. "But the master's gone to Ditchley, I think, and he can't be back just yet," she added, triumphantly; as if the master's absence at this crisis, if a discredit to himself, was a decided benefit to the rest of the household.

"I know. He has gone on business," said Mrs. Scanlan. And then the business he had gone upon came back upon her mind in all its painfulness; she turned so deadly white once more that Bridget was frightened.

"Oh, ma'am!" she cried, "what in the world has happened?"

(Here I had better state that I make no attempt to give Bridget's brogue. Indeed, when I knew her she had almost none remaining. She had come so early into her mistress's service, and she had lived so long in England, that her Hibernicisms of speech and character had

gradually dropped off from her; all except the warm heart and elastic spirit, the shrewd wit and stanch fidelity, which especially belong to her nation, neutralizing many bad qualities, to which miserable experience forces us to give the bitter adjective—so “Irish.”)

“Nothing has happened,” said Mrs. Scanlan. “I suppose I am not quite so strong as I ought to be, but I shall soon be all right, I hope. Come, Baby, it’s near your bedtime; my blessing! don’t cry so! it goes to mother’s heart.”

She roused herself and began walking up and down with Adrienne in her arms, vainly trying to still her cries and hush her to sleep, but looking herself so wretched all the time, so feeble and incapable of effort, that Bridget at last said, remonstratively:

“You’re not to do that, ma’am. Indeed, you’re not.”

“What do you mean?” said Mrs. Scanlan, turning quickly round; “what am I not to do?”

“Not to be carrying that heavy child about. It isn’t your business, ma’am, and you’re not fit for it. And I’m not going to let you do it, either.”

“I must,” said Mrs. Scanlan, in a tone so sharp that Bridget quite started. Her mistress was usually excessively gentle in manner and speech—too gentle, Bridget, who had a tongue of her own, and a temper also, sometimes considered. Nevertheless, the sharpness surprised her, but it was away in a minute.

Mrs. Scanlan turned round with tears in her eyes.

“I did not mean to be cross, Bridget. I only meant that I must learn to do a great many things that I have not hitherto done.”

What things? Bridget wanted to know. Because *she* thought the mistress did quite enough, and too much; she should be very glad when they had a second servant.

“No, we shall not have a second servant.”

Bridget stared.

“It is quite out of the question. We can not possibly afford it; Mr. Scanlan says so, and of course he knows.”

Josephine said this with a certain air of dignity, by which she wished to put a stop to the “argufying” that she feared; but Bridget, instead, looked so shocked and disconsolate that her mistress took the other tack, and began to console her.

“Really we need not mind much about it. A girl of twelve would have been very ignorant and useless, and perhaps more of a trouble than a help; and I shall be able to help much more by-and-by, and according as I get used to things. I was so very innocent of all house affairs when I came here,” added she, smiling, “but I think I grow cleverer every day now.”

“Ma’am, you’re the cleverest lady I ever knew. And you took to housekeeping like a duck to the water. More’s the pity! you that can play music, and talk foreign tongues, and work beautiful with your fingers—and there you are washing dishes, and children’s clothes, and

children, with those same pretty fingers. I’d like to tie ’em up in a bag.”

“Thank you,” said Mrs. Scanlan, laughing outright now: she and Bridget often laughed together, with their French and Irish light-heartedness, even amidst the hardest work and the cloudiest days. “But seriously, think how many mothers have to take care of their own children without any nurse-maid—without any help at all—and I have yours. And three will not be much more trouble than two; indeed, this morning one of my neighbors consoled me by saying that, after two children, even ten did not make much difference.”

“And we may have ten!” said Bridget, with a very long face, and a grave personal appropriation of the responsibility, which at first made her mistress laugh again—then suddenly turn grave, muttering to herself something in French. For the first time it had occurred to Mrs. Scanlan that circumstances might arise in which these gifts of God were not altogether blessings. The thought was so painful, so startling, that she could not face it. She drove it back, with all the causes which had suggested it, into the innermost corners of her heart. And with her heart’s vision she utterly refused to see—what to her reason’s eyes would have been clear enough—that her husband had acted like a child, and been as vexed as a child when his carelessness came to light. Also that the carelessness as to worldly matters, which does not so much signify when a man is a bachelor, and has nobody to harm but himself (if ever such a state of isolation is possible), becomes an actual sin when he is married and has others depending on him—others whom his least actions must affect vitally, for good or ill.

But as she walked up and down the room, rocking Edward’s child to sleep—Adrienne was the one of her babies most like the father, César being entirely a De Bougainville—Josephine could not think hardly of her Edward. He would grow wiser in time, and meanwhile the least said or thought of his mistake the better. Nor did she communicate any further of it to Bridget, beyond saying that, besides omitting the little nurse-maid, they would henceforward have to be doubly economical; for Mr. Scanlan and herself had decided they were spending a great deal more than they ought.

“Ugh!” said Bridget, and asked no more questions; for she was a little afraid of even her sweet young mistress when it pleased her to assume that gentle reserve. But the shrewd servant, nevertheless, made up her mind that—by fair means or foul, by direct inquiry, or by the exercise of that sharp Irish wit in which the girl was by no means deficient—she would find out what had passed between the husband and wife, to make her mistress so ill. Also, whether there was any real occasion for her master’s extraordinary stinginess.

“It’s not his way! quite the contrary!” thought she, when, while Mrs. Scanlan was hushing baby to sleep, she slipped up and put

to rights the one large room which served as bedroom for both parents and children: finding Mr. Scanlan's clothes scattered over César's little bed; crumpled shirts without end (for he had been dressing to dine out), and half a dozen pairs of soiled lavender gloves. "What busi-

ness has he to wear lavender kid gloves, I should like to know?" said Bridget to herself, rather severely. "They'd have bought Master César two pair of boots, or the mistress a new bonnet. Ugh! men are queer creatures—I'm glad I wasn't a man, any how!"

MY ENEMY'S DAUGHTER.

CHAPTER XVI.

AGAIN—AT LAST!

THIS is not a story of the struggles of a poor artist and adventurer, though so much of my life was indeed just such a story. But lives like mine have been told so often before that I could add little new by dwelling on the professional and adventurous part of my existence, even if I had the art to tell such things as other men have told them. Therefore I frankly intimated to my readers long ago that I do not mean to enter into the details of my struggles, my disappointments, my privations, my temporary success. Of all these I shall only say, like the fair dame pressed to explain the duties of the *cicisbeo*, "I beseech you to suppose them." In brief, the professional story of my life is this: I struggled long and wearily. At last I succeeded, for a time. Then I lost the best of my voice, and I faded back into quiet obscurity, not without comfort. For what Carlyle calls four-and-twenty resplendent months I was a brilliant success in the popular sense. I know myself, and I know that I never was or could be a great singer. I never was in the high sense an artist. I never had a genius for music, or for any thing; but I had my run of success—I had my day. It was a short one, and it is over; and I don't regret it. "I cease to live," says the poet's Egmont; "but I have lived!"

In my days of swift success I came to know a great many authors, sculptors, painters, critics, artists of every class, who had all more or less succeeded in life; and I found that the actor or the singer has some splendid chances which are denied to any other adventurer after popular favor. Worst off of all his brethren I rate the literary adventurer, although Thackeray, with the complacency of recognized and triumphant genius, pointed out the immense advantage the author enjoys in requiring neither patronage nor capital, but only a few sheets of paper and a steel pen. Where is his arena, his tribune? He has written his grand tragedy. Very good. Who is going to play it?—nay, what manager is going to read it? He has finished every chapter of his novel; and then begins the dreariest part of his business. I remember literary friends of mine used to say, when sometimes the author of "Vanity Fair" showed his grand white head among us, that he had had toil enough to persuade the public to read what he had written, that he had hawked about his great book long enough before any

publisher could be induced to run the risk of printing it. The difficulty was to get any publisher to read it. Change "Vanity Fair" into a picture or a statue, and it would at least have found a place in an exhibition, where a crowd, coming for the sole purpose of looking at pictures and statues, would have seen it, and some eye would surely have found out its worth. To read through thousands on thousands of scrawled MS. pages, in the hope of some time coming on a literary treasure, is a wearisome diving process which only stubborn souls long endure; but to hunt through an art-exhibition is a pleasant and easy work. I rate the chances of the painter or the sculptor, then, rather above those of the literary man. But while it is true that not every one can get a chance of exhibiting his picture in any gallery, it is also true that even in the gallery it may pass unnoticed of the crowd, who only run to look at the pictures of men with names, or pictures they have been forewarned to look at. Suppose, however, that every one going into the gallery were compelled to look at every picture in turn—were compelled at least to stand before it, and look at that or nothing for a certain number of minutes, would not the obscure artist's chances be immensely increased in value? But this is precisely the condition of the actor or the singer. Once, at the very least, in his three or five acts he is in absolute possession of the audience. No one may speak or sing but he. It is his chance. If he can speak or sing in any way worth listening to there is his opportunity of doing it. I have known scores of men in other professions who only wanted just one such chance to crown their ambition, or, at all events, to crush it, and who never got the chance, but went along through life disappointed and embittered, girding at the successful, snarling at popular favor, wailing against destiny, and always convinced that if the world could but have seen or heard them it would have fallen in homage at their feet. The public, indeed, will not go fishing for talent, like pearl-divers. It is enough to ask that they shall recognize it when set before them. "Genius," says Mürger, "is the sun; all the world sees it. Talent is the diamond in the mine; it is prized when discovered." This was my chance. I got an opportunity of holding up my poor little artistic diamond. The opening came; I had the stage all to myself for a few moments, and I really had been gifted by Nature with a voice which then, at least, could hardly have failed to make an impression. It made its impression, and I succeeded.

This was in Italy. I came home to England, after an absence comparatively very short, a success. My way began to be clear before me. I began to have friends, admirers, rivals, detractors, satellites, partisans, and enemies. I grew familiar with my own name in print; I became accustomed to the receipt of anonymous letters—some full of praise, not a few full of love, a great many breathing contempt and detestation. I began to judge of journals and critics only according to their way of dealing with myself.

I must say that hardly any kind of life seems to be more corrupting to independent and generous manhood than that which depends upon the public admiration. It is hardly a whit better than that which hangs on princes' favor. The miserable jealousies, the paltry rivalries and spite, the mean, imperious triumph over somebody else's failure or humiliation, the pitiful exultation over one's own passing success, the womanish anxiety to know what is said of one, the child-like succession of exaltation and depression, the absorbing vanity, the sickening love of praise, and the nauseous capacity for swallowing it—all these seem to be as strictly the disease and danger of artistic life as yellow-fever is of the West Indies, or dysentery of the East. I have indeed known strong natures both in men and women which could defy the contagion, and retain their healthy and self-reliant simplicity to the last. I have seen, even in stage-life, virgins who could tread those hideous hot plow-shares of vanity and jealousy, and come out unscathed. I have known men who to the last kept the whiteness of their souls, and never felt a pang of mean joy over another's failure, or of unmanly pride or unmanly grief at success or failure of their own. But such natures are indeed the rarest of phenomena, and only make the general character of the race show more repulsively. You can't help it; I mean, we common natures can not help it. Some of us go in resolving that we will not be like the others, that we will not lay down our manhood, and our courage, and our generosity, and succumb to the poisonous atmosphere of praise, and rivalry, and jealousy. But we soon grow like the rest; we rage at a disparaging word; we swell with pride over the most outrageous praise; our bosoms burst with gall when some new rival is spoken of too favorably or applauded too loudly; we rejoice with a base and coward joy, which our lying lips dare not confess, when some one whom openly we call a friend makes a failure and falls down. Our nature becomes positively sexless; and man detests woman if she outshines him, just as rival beauties of a fribble season may hate each other. I protest I did not, until I came in for some little artistic success, ever believe it possible I could hate—or, indeed, that any man could hate—an attractive and pretty woman who had never either slighted or betrayed him. I soon learned that the wretched creature who lives on the favor of the public can get to envy

and detest any being that stands between him and the sun of his existence.

From my soul I detested the whole thing. I distinctly saw my moral nature becoming contaminated by it, and I despised myself even for the momentary pang of pride and envy which I honestly did my best to crush and conquer. I sometimes thought to myself, "The time must soon come, if one of us does not die meanwhile, when I shall meet Christina. Shall I find her even as one of these? Shall I find that her heart swells with pitiful pride and rankles with paltry spleen; that she hates her rivals; that she can swallow any amount of praise, and gladden in it; that she can cry when some critic disparages her or praises some one else?"

I could not believe it; yet I could not but fear; I could not but sometimes wish that I had been less fortunate in my personal ambition, and that I were still far removed in obscurity out of her possible path.

I heard of her often. She was soon to return to England, where her sudden departure and long absence, after so sudden a success, lent new attraction to her. People said she was married. I had heard the statement almost with composure. She had become like a dream to me. When I saw her last I was little more than a boy; I stood now on the latest verge of my youth: a whole working lifetime lay between. I believed that I had so far disciplined my nature and subordinated early and disappointed passion, that I could meet her now again with unmoved politeness, and even on our first meeting look calmly in her face, touch her hand without tremor, and congratulate her becomingly upon her great success.

Yes, they said she was married; and it was certain that she now described herself as Madame Reichstein, not Mademoiselle Reichstein. Indeed, some maintained that she was not only a wife, but actually a widow. But they said all manner of things about her. Her husband was an *entrepreneur*; he was an Australian adventurer; he was a rich Yankee speculator; he was a scion of a noble Austrian family, who never would look at him after his *mésalliance*; whoever he was, he had deserted her: no, it was she who had run away from him while they were living at Nice, and actually in their honeymoon; he used to beat her; she once tried to stab him: at all events, he was dead now. Nay, there was not a word of truth in all that; the real fact was, that she never was married at all; the young nobleman killed himself for love of her, and left her all his property; and so forth, and so forth. These and countless other stories—equally incoherent, extravagant, and contradictory—passed from mouth to mouth among the people I met who talked about Christina Reichstein.

I found Ned Lambert, when I returned to England, quite established as the household friend of the Lyndons. He used to come and dine with them almost every Sunday, having made a definite arrangement to that effect with

Mrs. Lyndon, who was ready enough, and rejoiced to eke out her housekeeping by such a mode of contribution, and who had indeed quite a genius for cookery. Lambert liked the change immensely. He said he was fond of a good dinner on Sunday, and that when he dined alone at his own lodgings he never ventured to ask his landlady for any thing beyond the cold corpse of a fowl cooked on the Saturday. But it was not his relish for a savory little dinner which brought him all the way to our dreary district; and I saw a marked change, both in him and in Lilla, when I once more joined the little circle. Lilla was more thoughtful, more melancholy, less pleasure-loving than before; he, on the other hand, was generally brighter and more animated, unless when he was studying manners and deportment, which indeed he almost always was. Many a time I saw him furtively glance under his eyes at Lilla, as if to learn from her expression whether he had accomplished a triumph or committed a solecism of etiquette. I could not resist the temptation to make an inquiry once in Lilla's presence about his Sunday evening relief from coat-sleeves; whereat he looked so distressed and confused that Lilla insisted on having the whole story, and had it accordingly, and laughed very much; and Lambert at last gave way, and likewise laughed; and we all laughed a good deal longer than the story deserved. I was glad to have made Lilla laugh at any one's expense, for, poor girl, she laughed less now than of old days, and her face looked pale and anxious. I soon found out the reason.

Between Lambert and myself we had boxes, stalls, and so forth, for some theatre almost at will. One night we went—Lilla, her mother, Lambert, and myself: Lambert would not stir without Mrs. Lyndon—to see a new performer as Claude Melnotte. He, the new Claude Melnotte, was the idol of one of the colonies, and was a statuesque, handsome, deep-voiced, energetic, wooden-headed sort of actor. I thought the whole thing dreadfully tiresome, and Lambert thought so too; but Lilla was quite melted by it, and streamed with tears. A year before I know that she would have laughed at the business, or yawned over it. I saw Lambert's eyes resting on her with profound admiration and sympathy; and he looked up and caught my eye, and gave me a glance, partly whimsical, partly sentimental, partly bashful and apologetic, which would have made quite a picture in itself. She had her depths of sensibility, then, this poor girl, whose bloom the hard coarse grit of London life had so nearly rubbed away. Never did she shed tears at a theatre when I was her companion, or care for any performance which was supposed to demand tear-shedding as its tribute.

I spoke of the change to Lambert himself that night.

"It's true," he replied, slowly and sententiously; "I have often thought that the best test you could have of a woman's intelligence and of her

sympathies would be to watch her demeanor at a theatre. Hear her comments, and observe how she looks; and the fellow who does not know her then is an idiot, who never could know any thing of her. You can't imagine, Temple, how I hate some women I see at a play: they look so cold and stolid and severely proper and self-contained, that I should like to have them expelled from the presence of art altogether. I wonder how you will feel at the sight of such people when you come on our stage, before our unimpassioned creatures here. It is not like Italy, Temple—at least, I fancy so; and indeed I have heard it from—Oh, from many who have felt it."

"From Madame Reichstein, for example?"

I was determined not to shrink from that name, or allow him to suppose that I faltered at it.

"Yes, from her in especial. She was dreadfully chilled here in London, although they gave her quite unusual honors."

"She would be. Her enthusiasm and her really lyric nature would naturally chafe against our British composure."

He glanced at me inquiringly, as if he meant to ask whether this calmness was real or put on. If I had been asked then I could have answered in all sincerity that I believed it real. I know now that it was but an effort of self-discipline.

"We had a sort of scene at a theatre one night," he said, rapidly changing the subject; "I mean Lilla—Miss Lyndon—and I."

"Indeed! What happened?"

"Some fellow—mad, I think—seized her by the arm, just as I was handing her into a cab—her mother was already in—and jabbered some insane nonsense at her. I pushed him away, and the wretched creature flew at me like a wild-cat, and there was quite a disturbance."

"Who was he? What was he like?"

"Oh, quite an *outré*, mad-looking creature, small and old, with a black wig. I could have crushed him; but, of course, I wasn't going to hit a poor old bloke—old man, I mean; and so I only dragged him away, and asked a policeman to take charge of him. But he was near raising a perfect mob about us, shrieking out that I was carrying off his long-lost daughter, and I don't know what other rubbish; and he cut my lip, so that I was a pretty sight, I can tell you."

"What became of Lilla?"

"She comported herself most bravely; neither screamed nor fainted. I got rid of my lunatic as soon as I could."

"Did Mrs. Lyndon see him?"

"No, she didn't. It so happened that she never got a glimpse of him; and I was very glad. She is a nervous woman, and would have been greatly frightened by the sight of so extraordinary a creature. Of course I made nothing of it, and I never heard any more about it."

"You never found out any thing about him?"

WE MEET AGAIN.

"Never; and I never tried to."

I said no more on the subject; I needed no further explanation.

Some days after this, a few of us—Lambert, myself, and one or two rising actors and *littérateurs*—gave a little *fête* to some of our friends at Richmond. It was very early in the season. We dined, of course, at the Star and Garter.

Lilla Lyndon was of the company. We were all very pleasant. I was as happy as a bright sun, delicious air, and joyous company could make any man; and I, at least, never could be insensible to the mere joy of living, of barely living, under such sun and in such air. I was a sort of rising star too, in a very small way, and might have flirted and been flattered a good

deal; and did on this occasion accept my opportunities. I walked through the gardens, after dinner, with a pretty, vivacious girl leaning on my arm; a girl who had just made a brilliant success in light comedy, and promised indeed to be another Abington or Nisbett, until she married, poor thing, and died in her first confinement. Her people lived not far from Norwood; and a short time since, walking out from the Crystal Palace all ringing with music, I strayed into a church-yard, and came upon a tombstone bearing the name of my poor young friend. This Richmond day, however, of which I speak, was darkened by no shadow from the future, and we were all very bright and happy.

"Look there!" said my companion, suddenly, and with a joyous laugh. "See how people make love off the stage."

She directed my attention to two figures in a shady little alley of shrubs and trees not far from us. They were Lambert and Lilla Lyndon. She was leaning on his arm; her eyes were downcast, her cheeks were crimson, her step was slow. He bent his tall figure over her; he was pleading earnestly, passionately—that any one could see—into her ear. It had come, then, just as I thought it would. He loved her; and now he was telling her so; and I could not doubt what her answer would be.

Queer pangs shot through me. I was rejoiced at the prospect of the happiness of both my friends. I thought with delight that Lilla would no longer be poor; that she would have a true home to shelter her, a manly heart to lean on; that he would have a life made warm by love; and I longed to congratulate them both, and tell them how sincerely I gladdened in their love and their happiness. And yet the sight brought with it too a keen sense of isolation and loneliness. I had felt for Lilla just that warm and tender friendship which is to love "as the moonlight to the sunlight." She had been a friend to me when friends were most precious and most rare. She had cared for me when I was sick, confided in me always; begged for me, unasked and almost unthanked, of one who probably despised her and me only all the more for it. And now I was about to lose her; the only woman from whom I could expect a greeting that was more than formal, a glance that was at once friendly and sincere. I don't say that this made me sad. I know I was sincerely glad that things were to be so; but it made me thoughtful. I was moody enough to wish to be alone for a little; and ungallant enough to get gradually rid of my fair and joyous companion. I felt a twinge of remorse at the recollection when I came the other day upon the stone which bore the record of her name, her birth, her marriage, her death, and the inconsolable grief of her afflicted husband—who is now alive and merry with his third wife.

I was glad to be alone. I stretched myself on the grass. The evening was glowingly, gloriously hot. I heard the voices of singers not

far away, and the notes of a piano. I saw nothing but the unflecked sky of blue above my head, and the slender spiral vapor of my cigar. Was I happy? Was I miserable? Happy or miserable, those moments were ecstatic. Are not the sensations produced by extreme heat and extreme cold so much alike that the African brought for the first time into contact with snow fancies it has burned him? I think there are pangs of delight and of pain—where the soul is the medium, not the nerves—which are not easily to be distinguished from each other.

I started at an approaching step. Lilla was close beside me; she looked pale and much distressed. I jumped to my feet.

"I have been looking for you every where," she said; "I want you to take me home."

"Home so soon? Are you going home already?"

"Yes. I should like to, very much; if you don't mind leaving so early. Or I will wait longer, as long as you like, if you will promise to leave a little before the rest, and to come with me."

"Certainly, Lilla, when you please. But where is Lambert?"

"Mr. Lambert? I don't know; at least, I saw him not long since."

"Will Lambert not wish to see you home?"

"If you can't or won't come with me, Emanuel," she said, petulantly, "if you must wait on somebody else, of course I must not worry you about me."

"Why, Lilla, my dear girl, you know very well I will go with you when you please. But I only thought—"

"Dear Emanuel, please don't think any thing; at least, at present. Only do oblige me this once; I am so tired, and I want to get away."

"We will go this instant."

"Thank you; that is kind. And I should like to get quietly out, quite unnoticed, if you please."

"This way, then."

I gave her my arm, and I felt her arm tremble on mine; and could feel that her bosom beat heavily as she leaned on me. Violet circles were round her eyes; and every time she spoke it seemed as if she must break into tears.

There were several hansoms at the door, in which some of our company had come. I meant to take one of them, and convey Lilla home in it. Young ladies don't usually go in hansoms, I believe, with young men; that is, where Respectability reigns. We had no such etiquette in our free and gladsome world. One of Lilla's special delights was, or used to be, a hansom.

But the gardens were full of company. There were many parties there as well as ours. Lilla and I, threading our way outward, were always coming on some brilliant group. It was significant of my poor young friend's state of mind, that she did not even cast a scrutinizing glance at the dresses of the ladies. We hardly spoke at all.

I brought her into a narrow side-path between flowers and plants. We were nearly out now. Toward us there came a group of four or five ladies and gentlemen, straggling along as the width of the path allowed them. One voice struck on my ear, and I knew its sharp and strident tone. I knew it to be the voice of Lilla's uncle. Eminently disagreeable I thought such a meeting would be in a place so narrow that recognition could not be avoided. It was now too late to go back, so we drew up to let the group stream by.

Lilla saw her uncle. She colored, and was a little confused. He did not seem particularly delighted at the meeting.

"Why, Lilla, *you* here?" He gave her his hand rather coldly.

I had been standing silent and stiffly, looking at nothing and feeling highly uncomfortable.

"Yes, uncle; but I am going away now. I have asked this gentleman—don't you know Mr. Temple, uncle?—to take me home."

"Indeed! Yes. How do you do, Mr. Temple?"

I made a formal acknowledgment of his enforced salutation, and in doing so I became conscious that the light of two deep, dark, soft eyes was turned full on me. I became conscious of it—I can use no other phrase—for up to this moment I had positively seen none of the group but Mr. Lyndon alone, and had never looked at the lady who was by his side, and who stopped when he did. But I felt that the light of those eyes was on me, and an electrical thrill ran through me, with which the blood rushed heavily and fiercely to my head, and the pulses of my heart seemed to stand still, and the grass for a moment flickered with changing colors, and the sinking sun appeared to reel in the sky.

And looking up, I saw that Christina Reichstein stood before me.

Not my Lisette! Not my Christina! Beautiful, stately, in the full glow of developed loveliness—no longer a girl; nay, now that the westerling sunbeams fell upon her face, I saw that there was something even of the melancholy beauty of a sunset in her own features and expression. Far more beautiful, far more stately, far more attractive, than when I knew her, but not with the fresh and passionate youth which was her exquisite charm long ago. Long ago! A whole life seemed to lie between that time and this. I thought there was something sad, something even of a prematurely wasted look about those glorious eyes. Youth, and early love, and early struggle lay buried in those lustrous hollows. They were as mirrors to me, in which I saw my own dead youth and disappointed love. I turned toward her, and our eyes met and rested upon each other in an instant of unspeakable emotion never to be forgotten in this world.

Christina recovered her composure in a moment.

"We are fortunate, Mr. Lyndon," she said,

in her clear musical voice, with the old dash of foreign accent still perceptible in it—"we are fortunate in not having left so soon as I wished; for we meet—at least, I do—two unexpected friends. Your niece I know already, though she seems to have quite forgotten me; and in this gentleman I meet a very old friend."

She gave her hand first to Lilla and then to me. Not the lightest, faintest pressure of her glove indicated to me that I was any thing to her but an old acquaintance.

"Indeed!" said Mr. Lyndon, dryly. "I did not know that you were acquainted with this—ah, this—gentleman, Mr. Temple, before."

"Did you not? Oh yes; we were old acquaintances ever so many years ago. How long ago, Mr. Temple?"

"Several centuries ago at least, Madame Reichstein."

"Yes; it must be many, many centuries ago," she said, slightly shrugging her shoulders.

"A good way of evading any confession of the number of years," remarked Mr. Lyndon, with a short dry laugh. "If you are going home, Lilla, I think you had better come with us."

"Thank you, uncle. If you can take me, I shall be very glad; and then Mr. Temple need not be dragged away to take care of me."

"No; we need not trouble Mr. Temple to leave so early. Come, Lilla."

"Good-night, Emanuel," said Lilla, holding out her hand to me. "I am so much obliged to you for offering to come with me; and so glad that I have not to take you away."

"Then I think I shall not go just yet," said Madame Reichstein. "I will go in Mrs. Levison's carriage; she is not leaving for a few minutes. I have not had the pleasure of seeing Mr. Temple for so many years that I can not leave him now, at least until I have exchanged a few words with him, and told him how and when he may see me again. Will you give me your arm, Mr. Temple?"

I offered her my arm without a word. Lilla looked at us both with wondering eyes. This was all the wildest of mystery to her. She forgot for a moment apparently even the trouble that was oppressing her, in the surprise of seeing this unexpected acquaintanceship reveal itself.

"Remember you promised to accept a seat in my carriage," said Lyndon. "We are in no haste; we can wait as long as you please."

"But I don't like the idea of any body waiting for me. No, Mr. Lyndon; pray excuse me this once. Your niece, too, looks quite tired and ill, and I think the sooner you take her out of this the better."

Lyndon scowled and contracted his brow, and looked at Lilla as if he could have found it in his heart to say something rather sharp of her illness, and her presence, and her existence altogether.

"Oh, Lilla's very well," he snarled.—"Are you not?"

"Quite well, uncle.—I am quite well, indeed, dear Madame Reichstein."

"You don't look so, child. No, you must go home, dear; you will come and see me, will you not? I have scolded your uncle before now for not bringing you to me. Good-night, dear." She kissed Lilla quite affectionately.—"Good-night, Mr. Lyndon, and thank you very much."

"Good-night. But you will be at Mrs. Levison's to-night, will you not?"

"Really, I had quite forgotten. Oh yes, certainly—at least, I think so. *Au revoir*, then."

Mr. Lyndon saluted *me* very slightly and formally, and I saw him cast an appealing, disappointed, impatient glance at Christina. It was vain, however. She bowed graciously, smiled sweetly, and then turned and led me away.

All this time I was like one paralyzed of speech. Not even that fiercest stimulus a man's power of self-control can receive, the consciousness that he is making himself ridiculous, could spur me to the mastery of my feelings and the faculty of unmeaning talk. Lately, when it had become apparently certain that I must some time, and that soon, meet Christina, I had rehearsed over and over again the manner in which I should demean myself. Sometimes it was to be a dignified and haughty coldness, sometimes an air of polite, genial, easy indifference. But the one way in which I was never on any account to greet her for the first time was just that which I now found myself driven into—confusion, embarrassment, constraint, and awkward silence.

My throat was dry, my lips were parched; the trail of her rustling dress along the walk was the only sound that seemed to reach my ears; the fragrance of perfumes came faintly from around her; her hand rested on my arm. I did not venture to look at her lest I should meet her eyes, and, stricken by them, give out my soul in some wild outbreak of love or anger.

"Emanuel!"

The word came up low, sweet, and thrilling to my ears. It pierced my heart. It seemed as if between that word and the "*Ade!*" I had heard her call from the window years and years ago there was only an utter void.

"Emanuel!"

"Madame—Madame Reichstein."

"No; not that name, Emanuel. Call me by the name you always gave me—long ago. That at least is mine still."

"Christina!"

"Yes. I am still Christina. You must not think harshly of me, Emanuel."

"I do not. Heaven knows I do not."

"You can not judge me, and you must not attempt to do so. I know by your manner now that you think I have injured you."

"Think you have injured me! Think! I look back on so many years of a life worse ten

times than any death, and you wonder whether I think you have injured me!"

"Emanuel, if we begin reproaching, I too have something to reproach. If we begin talking of years of suffering, do you think life has been all a pleasure and a joy to me? If you were disappointed, was not I? If you were deceived, was not I?"

"By me, Christina? Never. I—I—loved you, you only, and with all my soul—"

"Hush, hush, my friend, no more of that. No, not one word. All that is dead and gone long ago. Let it sleep. Why should we begin raking up the past, and reproaching each other, and making each other miserable? I did not wish or mean to do so. I wished that we should meet like old friends long separated, who are friends in heart still. I have heard of your success, Emanuel, and I congratulate you. I heard of it but now in Italy, where, look you, you have friends. Greater success too you will have yet. I was not surprised; I always knew it. And me—look at me. Well, I have not failed."

"No. You have indeed succeeded. You, Christina, have realized your highest dreams; you have all you ever longed or prayed for."

"And you envy me, perhaps? And look coldly at me? And wonder why I have succeeded so much better than others? And will join with my enemies in finding defects, and blaming the prejudiced public which overrates? No; I do not think you would do that. That would not be like you."

"Christina, that you could even suggest it shows that you do not know me. But, indeed, you never did."

"Did I not? But we will not talk of that. Well, then, I have succeeded; and you are just on the verge of full success. They tell me we are to sing together soon."

"So they tell me."

"Yes, I believe so; I suppose it will be. In fact, I will have it so, although Mr. Lyndon does not seem much to like it."

"What right of judgment has he?"

"Well, you know the right he has"—and she shrugged her shoulders—"the right of the man with the money who stands quietly in the shadow behind the manager whose name is on the bill. That right he has. But to me it matters little; I have my own way, or—"

"Mr. Lyndon is a close friend of yours?"

"I suppose so. I have a great many close friends, and I hope I value them all exactly as they deserve. You look coldly and strangely at me, Emanuel," she said, suddenly changing her tone of flippancy and cynicism, for the old friendly pathetic voice, "and you seem as if you too would judge me only by words, and ways, and externals. If you will, I tell you frankly beforehand that you will judge me harshly—as, perhaps, others do—and you will judge me wrongly, and I shall be disappointed. Do not; oh, do not! We shall have to see each other much in the future, and I should like dearly to have one friend and brother."

Voices were close behind us; and I heard Madame Reichstein's name mentioned as if she were sought for.

"This way, Emanuel, please; I see my friends, and I must go with them. Is it not all like a dream that we have met again? Thank you, Mr. Temple; you will come and see me?—Now, dear Mrs. Levison.—Good-night, Mr. Temple."

She gave me her hand, and said in a lower tone, "Good-night, Emanuel;" and left me.

I sauntered vacuously back into the garden. My brain was all in a whirl. I put between my lips the cigar long since extinguished, and was for a while unconscious that it did not burn. A sense of disappointment mingled with all the confused feelings that came up in my mind. The Christina I had found was not like the Christina I had lost. Something of sharpness, of worldliness, of flippancy, seemed in her which jarred and grated on me; and yet now and then some word or tone brought back all the old memories, the ideal Christina, the strong love. I tried to remember and dwell on only the one delicious, pathetic sound which came from her lips when she spoke my name, and to put aside all association of her with the common world—with Lyndon's coarse and purse-proud ways, with the kind of society in which Lyndon strove to be a dictator, with the paltry spites of cliques and the mean jealousies of rivals. I tried to do this; I did my best to succeed; but the sense of disappointment outlived my efforts.

CHAPTER XVII.

A BREAKING-UP.

I DID not want to meet Lambert or any of my friends any more that night; I had no motive for wishing to be home early; I had no motive, indeed, for wishing to do any thing, except to get away from just the place where I was: so I lighted a cigar and took to the road. I walked from Richmond, choosing all the by-ways and circuitous complicated "short-cuts" that could well be found, so that by the time I arrived in town I was pretty well tired. I looked into a theatre, and found it very dull; I dropped into a small and modest club of artists and journalists and young authors, of which I had lately become a member, and listened to some of the ordinary gabble in the smoking-room, about this man's piece and that man's novel, and this other's overdone "business" in the comic part, and somebody else's anger at the malignity of the critics, who don't see the merit of his wife's novel, and all the rest of the kind of thing which one hears in such a place. It was weary, or I was weary, and I hardly talked to any body.

At last it grew late, and I went home. I had resolved to stay out long enough to be certain that I should find nobody stirring; I was disappointed, however. There were lights in the

little parlor; I let myself in with my latch-key, and would have gone up stairs, if I could, without seeing any body. As I passed the parlor-door, however, Lilla's voice called me; I went in, and found her looking very pale and weary and sad. She was still in the dress she had worn that day at Richmond.

"Not in bed yet, Lilla?"

"Not yet; I have been waiting up partly to see you. Mamma is up too. I am going away to-morrow, Emanuel."

"Going away! Going where?"

"I am going to Paris. I am going to have a hand in a school there—in a kind of partnership with a person I know, a very clever sort of woman, a Miss Whitelocke, who took quite a liking to me, and has a very good opinion of my capacity—no great proof of her cleverness is that, certainly."

"But this is very sudden; you never spoke a word to me of this before."

"No. Because nothing was certain, and I hadn't made up my mind; and we both have our secrets, Mr. Temple, have we not? You always spoke of me as your sister, Emanuel; but you seem to have kept something from me which you would not have kept from your sister, and you allowed me once to exhibit myself in a very ridiculous light."

"Lilla, my dear girl, indeed there was nothing to tell. I did not know myself who she was; who Madame—"

"I don't want to know your secrets, Emanuel, and don't look put out about it, for I am not at all angry, and I think you showed only your good sense in not trusting so silly a creature as I have always proved myself to be."

"Indeed, indeed, Lilla, you don't understand me; you can't understand why I could not be as frank with you as I could have wished to be."

"Please let us not talk any more of that just now. I am going away, Emanuel; I must go from this place. I must try to do something for my mother, and make a home for her. Oh, she has need of every help, and she has no one but me—no one. Every one despises her—and us both—and I don't wonder."

"Your uncle, Lilla; does he know?"

"My uncle? Yes, he does. He scolded me to-day, and—and told me we were a disgrace to him; and so we are. And do you know what he offered, Emanuel? He offered to take me into his house and keep me like a lady—like one of his own daughters, he said—if I would leave my mother, and promise not to see her any more, except once a month, or something of that kind. My poor dear, loving, foolish old mother! She has made a slave of herself all her life for me; and little return I ever gave her."

"What did you tell him?"

"Well, I told him what he will remember. I flashed out upon him, and told him just what I felt; not a word did I spare. I told him I scorned his money and his kindness, and that,

please God, I would stand by my mother while she lived; and I am afraid I added that perhaps some day one of his own daughters might be invited to leave *him*, and might give a different answer from mine. He was quite white with anger. I didn't care—I don't care. I am glad I spoke out; it did me good; perhaps it will do him good."

"Lilla, I always thought you had a fine, noble nature; now I know it."

"Noble nature! nonsense. I am not going to desert my poor mother—now especially—that's all. But I waited up to tell you all this; and I want you not to say any thing to her about the condition my uncle offered, for I haven't told her that; she would worry me to death, poor soul, about sacrificing myself, and stuff. And I want you to back me up; to say that every thing I do is right and wise, and for the best, and all that. You will do this, Emanuel, like a kind, dear fellow, will you not? And don't speak of any thing else, any thing you may know or guess, or that—Oh, you *must* understand me; but just tell her you think I am doing the most sensible thing possible in going to Paris."

"But, Lilla, tell me—do let me ask you—why are you doing this? Do confide in me. You may do so; I know all."

"All?" she said, flushing up.

"Yes, my dear, all. I know, for instance, what happened to-day. I knew it was coming. Now, why can you not stay and make Ned Lambert—that true-hearted, manly, clever fellow—as happy as he asks to be?"

"Emanuel, you have said you know all. If so, you know my reason. I can not bring disgraceful vexation on Edward Lambert; and to marry me just now would bring disgrace on any man. Oh, I am so unhappy, so wretched; and I have been crying all the evening. I have been silly and deceived all my life through, and filled up with foolish and false notions and expectations; and at last I know the whole truth. It is enough to crush any one." And the poor girl burst into tears.

"Have you told Lambert your reason," I asked; "the reason of your leaving London?"

"I have not, I have not; and I am ashamed to say that I have still idle pride enough left in me to conceal the truth from him."

"But really, Lilla, I must ask you—is the thing so bad as all this? Are you not far too sensitive? You can't suppose Ned Lambert could be affected for a moment in his feelings toward you by the fact that—" I stopped, rather embarrassed. What was I to say of her father? This, of course, was the obstacle and the disgrace of which she had spoken.

"No, Emanuel, I don't. Ah, I know him too well; and for that very reason I will not allow him to be victimized."

"But would you not allow him to judge for himself?"

"No, Emanuel, no, no. Don't speak of it

to me; pray don't. And, oh, I beseech of you, I implore of you, don't tell him! Don't let us seem disgraceful in his eyes. Listen: I have not been brought up well, Emanuel; I need not tell you that. I have not been made to care much for truth and religion, and any thing of that sort; and I am not religious, or particularly good; but somehow I never did see this so plainly as of late, when I came to contrast myself with others—and with *him*. I don't think I should have been fit for Edward Lambert at my very best. I don't think poor mother and myself are much the sort of people to make a very delightful home for so good and noble a man. But this last thing I have come to know has decided me. Emanuel, have you seen my father?"

"I have. I have known him for some time."

"And known who he was?"

"Yes, Lilla."

"Yes. And you kept it to yourself, because you did not wish to shame me?"

"No, Lilla; because I did not wish to pain you when there seemed no need of it, or no good likely to come of your knowing it. It does not shame *you*; it can not."

"Not in your eyes, perhaps, for you know us; and you know it is no fault of ours—at least, of mine. Not in your eyes."

"Nor, surely, in *his*."

"Oh no, no; I know that. But it would bring on him endless vexation and humiliation; and I should be a scandal to him, even though he did not say it, or think it; and I can not bring him or myself to such a pass. I could bring him nothing but disgrace, and that I won't bring him; I think too highly of him. I feel that I am doing right; and I think it is the first time in my life I ever resolved upon doing any thing just because it was right. I have been silly and frivolous enough; but I have my feelings, Emanuel, and my sense of honor, and my pride, like other people."

"Lilla, my own," called her mother's voice from below, "it is late, my dear, and you ought to be in bed."

"Yes, mother, I dare say I ought; and accordingly I am not."

Lilla was going to make—nay, had actually made, and in very spirited fashion, too—a great sacrifice for her mother; but she could not keep from occasionally snubbing her. Good Mrs. Lyndon was sometimes a trying dispensation to a quick, impatient young woman; indeed, she was one of those good people who seem made to be snubbed.

She came up herself presently, looking very shaky and flustered.

"We're going away; we're all breaking-up, Emanuel," she said, looking inquiringly at me.

"Lilla's going in the morning."

"I know, Mrs. Lyndon."

"It seems sudden, don't it? And we were just getting all to rights here, after such trouble and difficulty and work. But Lilla thinks it's for the best."

"Yes, mamma; we've argued the point already quite enough, I think."

"She won't give in to her uncle, Emanuel; although you know that he's been so good to her."

"Stuff, mamma! Now do stop, there's a good woman."

"And you've heard something else, Emanuel?—Have you told him, Lilly?"

"Oh yes, mamma—yes."

"She's refused him, although he is so good and kind, and so fond of her. Of course he is not what I should have liked, and what I should once have thought only right and proper for Lilla to have. She ought to be a lady, and of course Mr. Lambert isn't the sort of a person one had a right to expect. Oh dear, there was a time when, if any one had told me that a person in his position would have thought of asking my Lilla to marry him, I shouldn't have thought he could be in his senses—I shouldn't indeed! But you know, after all, people must yield to their circumstances; and what I say is, I never knew a better or more worthy young man—and doing so well, too. I do think it's a pity; but Lilla's so willful."

"I suppose I was always willful, mamma, wasn't I?"

"Yes, my own, that you were; and such a troublesome girl, many a time."

"Yet you were always fond of me, you dear old woman."

"Fond of you, my love? Ah, fond is no name for it!"

"Well, then, you will continue to be fond of me still, though I am much more willful now than ever. Besides, if I was always so, it isn't much use trying to be any thing else now. 'What's bred in the bone,' mother; and all the rest of it."

Lilla was doing her best to carry it lightly, saucily off. The effort was not very successful.

"Have you advised at all with Mr. Temple, Lilla?" And the mother threw an appealing glance at me.

"I have, mamma." And the daughter threw an appealing glance at me.

"Yes, Mrs. Lyndon, I have talked with Lilla. I did at first speak to her as you have done; that is, to something like the same effect. I did think she might have married poor Ned Lambert at once, instead of postponing it. But I must say that she has spoken to me in a way which shows me that she has clear and strong reasons, and a feeling that we must not try to counteract. You must let her have her way, Mrs. Lyndon. I think we may trust her that she is guided right; and I hope and believe I shall see her and you, and Ned Lambert too, happy, quite happy, before long."

"If it please God," said Mrs. Lyndon, with a half querulous sigh, which seemed to say that one couldn't always rely upon Providence to do exactly the sort of thing one wanted.

"You don't mean to see him again, Lilla?" I

said, turning back as I was about to leave them for the night; "not in the morning, before you go?"

"Oh no, Emanuel; it would do no good. I don't want him to know until after I am gone. You will give him this little packet, please, from me; it's only a poor little keepsake; and you may tell him, if you like, how sorry I was for going; and you will put it in the best light you can, and make him see that it can't be helped. And you may tell him, if you like, of my gratitude to him, and—and—of my unchanging love."

She fairly broke down at last into sobs, and signed for me to leave her.

I left her with deep regret, and sympathy, and pity. I confess it seemed to me that she was making a needless and Quixotic sacrifice; but from her point of view what she was doing was clearly right, and I could not but admire the quiet, resolute spirit with which she had chosen her way and walked whither it led her. I felt in this regard a thorough admiration for her. A sort of pariah myself, I always feel a special and natural pride in any brave good deed done by one of my caste. It is the business and the inheritance of the Brahmins to be brave and good, and to think no little of their own bravery and goodness; and they do not want the admiration of such as I am. But when the courage and virtue are shown by one of those from whom we do not expect any thing of the kind, then I am inclined to wave my cap and cheer. We hear of all sorts of self-sacrifice in books, and even in real life; some of it of a very stony, implacable, and self-tormenting kind, which I at least can not find it in my heart either to love or pity, but only shudder at, and pray to be kept forever out of the presence of its silent icy rebuke and self-assertion. Self-sacrifice is indeed the model and pet virtue of the age; and some of us are always inclined to rebel against models and pets. Moreover, it is almost always exhibited by somebody from whom it is naturally to be expected—the *noblesse* of whose virtue, personal and inherited, obliges its owner to such deeds of devotion; it is done under the impulse of lofty religious inspirings, it is preached up by good and authorized preachers, it is sanctified with holy texts, it is illumined and encouraged by hopes of everlasting reward, and the eternal society of harps and seraphs. My poor little London pagan had no such stimulants and encouragements. Her sacrifice was not made as a slave performs a duty, or as a courtier denies himself now that he may have the greater thanks hereafter. It was altogether the impulse of native honor and nobleness and love—above all, love. It thought of no reward, here or beyond; it was all sacrifice. It was foolish, perhaps, in one sense; but there are some of us in whose eyes even Virtue looks most attractive when she is a little irregular and unorthodox in her ways.

CHAPTER XVIII.

"THOU HAST IT, ALL!"

So our dreams had come true at last; our wildest hopes had been realized. We had both succeeded. Christina and I sang together during the remainder of that season at the best house. She was the great success and idol of the hour; I was, in my own way, a success too—greater than I had ever expected. Just think of the changes time had worked for me with unthought-of liberality. Only a little while ago I was poor—horribly, bitterly poor; a man to whom the fare of a hansom was an expense to be avoided and fought against. Now I had, for a bachelor, plenty of money, and spent sovereigns heedlessly where even two years ago I dared not lay out shillings. Now I had a name that was known pretty well every where—that is, where people talk about singing. Now I was once more restored to the society of Christina. We sang together; our names were constantly and of necessity coupled. I saw her almost every night. We were applauded together; I led her before the curtain at every recall; I gathered up her bouquets for her. On the stage I was always associated with her; off the stage I could see her when I pleased. We were now in very reality swimming together, and side by side—the success we used to dream of and rave about years ago.

Was ever mortal so blessed of the gods as I?

Let me answer in a sentence. My life was unhappy, and I was sinking every day in my own estimation deeper and deeper. I was becoming demoralized.

I have already said that during my long separation from Christina her memory was my preservation from any thing mean or low or degrading. How did it happen that association with her now seemed to produce just the opposite effect?

To begin with, I could not any longer understand either her or myself. She was no longer my Lisette. All the freshness of her nature appeared to have been washed away. Her soul seemed somehow to have contracted; the brand of the world was on her. The bloom was off her cheek, and, as I believed, off her heart. Yet she fascinated me as she did others; and I clung to her, and walked in her shadow, and was unhappy without her, and unhappy and disappointed with her.

Except when on the stage. There, and only there, I saw my Christina. I have avoided, and shall avoid, a cold and lengthened description of her as a singer and an actress. But she delighted me, and, I could have almost said, she surprised me. Her voice was as it had always been, more remarkable perhaps for its clear, bright, vibrating strength than for the softer and sweeter tones; but the great charm about her was the perfect unity and harmony of her acting and her singing. She did not quite belong to that grand and classical line of singers which seems for the present to have

closed with Grisi; neither had she any thing in common with the school of the pretty musical humming-top, the warbling butterfly, which is just now our pet ideal. Her voice and her style expressed romantic, not classic, passion and love and tragedy. She was always a woman; never a goddess. But her whole soul was infused into what she sung. She was to the grand classic singers what Victor Hugo is to Racine. Into mere piquancy and prettiness she never degenerated.

I admired her greatly, wholly. In every thing she did there was the unmistakable presence of genius. But when I strove to criticise her calmly, putting myself into the position, as well as I could, of the average public, and asked myself, "Will her fame last?" I was forced to reply, "I do not think so."

In the first place, she was not careful of her voice. She exerted its powers with a generous carelessness, a splendid indiscretion. Each time she appeared on the stage she seemed to have said to herself, "This night I will do my very best, no matter what my state of health or strength: let to-morrow care for itself."

But, again, I doubted for the permanence of her noble, natural, thrilling style in its hold on public favor. It was not the lofty, the goddess-like, the terrible, which made other great singers irresistible in their power; and it had nothing to do with the saucy fascinations and joyous little nightingale trillings which set vulgar audiences, no matter how high their social rank, into ecstasies. There was neither terror nor trick about it.

It was difficult for me to criticise even thus far, for I hung upon her voice and her successes like the most devoted lover. The first time we sang together I was almost indifferent about my own success, so completely was I wrapped up in hers.

On the stage, then, she was all I could have expected, the very danger which I feared for her coming only from the truth and integrity of her artistic genius. But the moment she ceased to be a lyric queen and became Christina Reichstein—I could hardly now call her, even to myself, Christina Braun—she disappointed me while she most fascinated me. I had to go away from her in order to bring the true Christina back into my mind.

She coquetted with any body—every body who paid her homage—with, for a long time, one exception, myself. Of course I hung on to her like an idiot; I did indeed still passionately love her; but it was a long time before one glance of encouragement invited me on. Understand that this in itself was often to me a flattering and a maddening incitement. She seemed, I sometimes thought, to hold me apart from all the rest—seemed to say, "I may flirt with others and play with them, but not with *you*. We stand on different ground. We must be lovers—or nothing." I now believe Christina acted in this from a high deliberate motive; I do believe she thought the memory of our

past too sacred to be profaned by any contact with the commonplace and frivolous flirtations in which it was sometimes her humor to indulge. Then I thought, according to my mood, that she was resolved to repel me utterly, or resolved to make me her slave; and I sometimes adored and sometimes hated her.

Perhaps I might have taken heart of grace and broken loose altogether from her, and stood up and been free, but for the expression with which I sometimes—only sometimes—caught her eye resting on mine. Old, sweet, sad memories seemed to shine in it, and to bring our hearts together for the moment once again. This happened more often when we were on the stage than at any other time. Always the moment my eye thus met hers she turned away, and her expression and manner changed; and when next I met her she was sure to be colder than ever to me, and perhaps to be more ostentatiously friendly than ever to somebody else whom I especially disliked. There were many whom I disliked on her account, believing one week that she surely cared about them, and finding out the week after that she held them in the most absolute and supreme indifference.

Thus, then, the season mooned away. Thus it came about that, though I had succeeded, was the tenor of the season, and at the best house; sang with Christina Reichstein, helped toward her success, and shared it; saw her frequently off the stage—she received her friends at her lodgings in Jermyn Street on Sunday evenings, and one or two off afternoons in the week—was a constant visitor, and perhaps ought to be very happy—I was distracted, disappointed, and miserable.

What on earth was the reason why I so hated to see Christina acting and singing with any body but myself? What was it to me? Nevertheless I always felt keenly annoyed when the chances of the situation flung her literally into the arms of some stout basso, who probably felt no emotion whatever except anxiety about his own part, and its effect on the audience. She acted with such genuine and artistic effect that I sometimes became ridiculously annoyed. She clasped her operatic fathers and lovers with a clasp apparently as fervent and impassioned as if they were genuine fathers or lovers, or only lay and feelingless figures. She never thought of them at the moment, as I knew well who had to embrace her publicly a dozen times a week perhaps, and knew how utterly absorbed in her lyrical art, and how absolutely indifferent to me, she was all the time.

It would be idle to deny that stories of her past life were whispered about which it was torture to hear, even though I knew that there was no word of truth in them. I was got into a silly row with a fellow who named the very year in which he knew, he said, that she was living, *au cinquième* in a house in the Quartier Latin, with a young artist whom she afterward threw over, and who accordingly took to absinthe, and finally to the Montmartre Cemetery. The

story-teller fixed upon the very year before Christina's father died, and when she was living peaceably and working hard, for a girl, in our quiet old town by the sea—before ever she had set foot on Paris pavement. I hardly ever, indeed, heard any story, good or bad, told about her which my own personal and certain knowledge did not enable me to contradict. One reason for this was, that so far as her recent years—her years of growing celebrity—were concerned, nobody had a word to say against her. Her life had left no opening for suspicion, or even for calumny. But a beautiful and attractive woman in that line of life, who has cruelly sinned by her sudden and signal success, must have done wrong some time or other, you know; and as there is nothing to be said against her during the years which were passed under our own observation and those of our associates, the inference is obvious—the error must have been committed in the obscurer years before we came to know any thing about her. Therefore three out of every four of the stories whispered about her referred to those old dear early days when her life surely was one of the calmest and purest that even a German girl could live.

There was apparently some mystery about her marriage. That she was married appeared to be certain; most people said she was a widow. Ned Lambert did not know; he said he always took it for granted that she had married the Italian who had her educated and brought out, and that he had died, or they had separated somehow. This was the only scrap of mystery—if it was mystery—about her; and she lived an open, frank, and fearless life, absolutely like one who had nothing to conceal. A steady, elderly German woman always lived with her; a woman of some intelligence and education, with a great eye for artistic make-up, and a good business memory—a sort of compound of poor relation, paid companion, and lady's-maid.

Christina never talked to any body of her past life, or indeed much of herself at all. She had a great many friends, and was free, friendly, and joyous with most of them.

I made slight allusions several times to the old town of her early life and mine; but she did not seem inclined to go back to any such memories, although she showed not the slightest embarrassment on the subject. Once, at last, when I had again made allusion to it, she seated herself at the piano and sang, as her only answer—I believe to an air of her own composition—a little ill-humored ballad by a German poetess, whose name I now forget, expressing entire disregard and contempt for all the associations of the poetess's native town and early days, except for the memory of an old tree which pleasantly shaded her childhood. I ceased after that to say any word which might remind her of that past from which she had evidently made up her mind to be wholly severed.

What I detested most was to see her haunted by the presence of Mr. Lyndon, M.P. He was always in attendance on her; and I hated him. He ignored my existence when he could; I avoided meeting him when I could. There was something about his manner to me which was always strangely irritating; all the more so because there was nothing in it on which a man could reasonably found any cause of offense. His manner ever seemed to say, "*You* are not a person to be received by me as an equal. I know what you were, and that is what I always choose to think you. Others may regard you as a successful artist, and so, being like myself professed patrons of art, may admit you to their intimacy. I don't choose to see your success, or to care about it. You may be tolerated by Madame Reichstein; that is no reason why you should be tolerated by me. I may make myself a slave to her openly and ostentatiously; that is no reason why I should be so condescending to *you*." I am afraid there was something mean in my dislike of him; my detestation of his cold arrogance, his insolent money-pride, his bearing even among those of our artist's circle whom he specially favored. His very homage to Christina I thought had something offensive in its ostentation. It always seemed to say, "Behold what so great and grand a personage as I can do for beauty and art! I can come down from my serene respectability and be the cavalier in service of a singing-woman."

Christina, however, did not seem to regard his attentions in that light. She encouraged him, flattered him, trifled with him, coquetted with him; sometimes had long and serious talks with him in the corners of crowded rooms. He took her to the Ladies' Gallery to hear the debates on nights when there was no opera. He hardly ever spoke himself, or intended to do so; but he was a steadfast Whig party-man; and people said ministers thought a great deal of him, and that he might have been in office if he liked. He was often on the platform—sometimes in the chair—at Bible-society meetings and missionary meetings; and he was dead against opening places of amusement—or even the British Museum—on Sundays. He had his vices, but they were very quiet and decorous. His looks and his ways with women—the women I usually saw him with—had a cold, consuming sensuousness about them which I thought detestable. He had been married twice, and now had long been a widower; and he had the repute of being the very best of fathers, especially devoted to his younger daughter, who never thwarted him, as her rigidly religious sisters did, on the score of his operas and his singers and his liking for the ballet. I never could quite understand how a man could be greatly devoted to his daughter, and wholly unscrupulous as regarded her sex in general. But it seemed Mr. Lyndon was so. People admired him for the former peculiarity, and thought none the worse of him for the latter. He was

commonly set down as an excellent man, of great ability and influence; and most persons paid court to him accordingly.

He was, I discovered, a great patron of revolution. Refugees from disturbed continental countries were constantly seeking him out and being taken up and patronized by him. Christina, too, seemed always interested in that sort of thing; and they evidently used to have semi-official conferences about it. Observing this, I of course began to detest and despise all continental refugees; to regard them as humbugs, like Mr. Lyndon, and to think oppressed nationalities nuisances and shams. I could not believe that Christina really cared much about such business; and for Mr. Lyndon I set it down at once that he had no other interest in it but that it ministered to his own consequence and importance. In fact, he was a patron, and only kind or even civil to those who approached him as such—except, of course, women, who, when they were good-looking, carried claims of their own about with them which commended them to Mr. Lyndon's attention. Moreover, he seemed to take a sort of pleasure in watching the smallness of human nature even in those he paid court to; and he laughed a short and sharp little laugh over any small humiliation to which his closest favorite might happen to be put.

Thus the man presented himself to my observation. I never knew any thing worse of him than just what I have told or indicated; but I strongly disliked him; and as, thank Heaven, I never approached him as one approaches a patron, or recognized his right of patronage, he never was any thing better than coldly civil to me—and not even that when he could with decency avoid it. If afterward I may have pained or injured the man, not quite without malice, I may at least explain why it was that from the first and to the last I detested and despised him.

Christina sometimes gave suppers at her rooms (please to remember that I am describing the ways of ten or a dozen years ago), and I used to meet some of her sister-singers there, and one or two military men, and a few of the leading critics, whom no actor or singer is ever indifferent about conciliating. I was generally found at these gatherings, chiefly because, although I hated to be there, I could not help myself, and had not the spirit to stay away. They seemed to me entirely frivolous, hollow, heartless. Christina herself appeared to have sunk quite down to the level of her surroundings. The conversation was for the most part mere gabble and gossip and satire. Every one paid court to the ruling artists who happened to be present by sneering at their absent rivals. Hostile critics were denounced and no doubt calumniated. Stories were told of the presents made by such a tenor to such a critic to explain the tremendous puffs with which this or that journal, defying all audiences and musical science and common-sense, flamed in the fore-

head of the morning sky. Counter-insinuations were made about the diamond rings, and other temptations yet more bewitching, with which this or that soprano or contralto had vainly sought to corrupt the impregnable honor of another critic who happened to be one of the company.

The literary gentlemen did not appear to have much more *esprit de corps* than the singers. If the latter babbled all manner of hissing stories against their rivals, the former listened complacently and even assentingly to the keenest insinuations against the honor and the trust-worthiness of brother critics. The critics seemed to have an enormous estimate of their own power; and not an unreasonable estimate, judging from the court paid to them by those who ought to be best able to appreciate their influence. No one seemed to think much about the public at all. It was quite a matter between the artists and the critics. If these approved of and wrote up those, the thing seemed to be done.

From my own point of view it did not thus appear to me. I had always relied on the audience rather than on the critics, and indeed had been somewhat ignored by the latter. I owe them no ill-will on that account. Frankly, they were right. Even then I had arrived at a very fair estimate of my own merits. I knew even then that I had a voice and nothing else. My soul was not in the art; and I felt satisfied that some time or other this must be found out by the public. I was quite aware that I had not one ray of the inspiration which lighted the soul and the eyes of Christina Reichstein in some of her great parts. I knew that I was little better than a musical automaton; but I was a success with the audiences for all that. The opera-house and the concert-room filled for me; and had my voice only endured I must have made a fortune. The critics could not do much to serve me; and they seemed rather too puzzled by my success to go boldly in for attacking me.

One evening I remember in particular. Some dozen or so supped at Christina's rooms. It so happened that this night she took hardly any notice of me—certainly distinguished me in no way from the most commonplace of her ordinary visitors. Mr. Lyndon sat at her right hand, and paid her devoted and undisguised attention, which she took with a quiet assent that half-maddened me. On her left sat a distinguished critic and *littérateur*, who had written successful plays and successful novels, published capital translations of various foreign works, edited scientific volumes, compiled biographies, and even varied the more laborious occupations of his life by appearing occasionally as an amateur actor. He had an astonishing power of conversation; he could talk with marvelous fluency and vivacity on all subjects, and almost in all European languages. To this gentleman Christina always intimated that she owed a great deal. He had been, it would appear, one of the first

to note and to welcome her success. He was, too, as I afterward heard from her many a time, one of the few who understood that she was something more than a mere singer. Indeed, the criticisms he had published about her did show a deep and genuine appreciation of all those qualities of her voice, her lyric style, her dramatic power, which were most truly great and peculiar. There was nothing in him which was not apparently sincere and manly. It did not even then surprise me that he had manifested no particular admiration for *my* genius and merits. He had taken my success, such as it was, quietly, and as one whom nothing on the part of the public could astonish; and he had said nothing ill-natured, or satirical, or even distinctly depreciatory of me, only said just as little of me as might be—habitually recorded the fact that I won applause, and so let me go on my way.

Ordinarily I should have felt little of anger toward any body who, like myself, did not think me a great singer. But this particular night I felt altogether out of humor with myself, and naturally therefore inclined to be put easily out of humor with every body else. I was beginning of late (for reasons to be more fully explained presently) to doubt myself, to suspect that I was capable of playing a mean and ignoble part, to look on myself as capable of servile love and low-minded rancor. I was beginning to be ashamed of my slavish hanging after Christina's skirts, and to feel abashed and perplexed by other weaknesses too. I thought I saw myself sinking, and that others too must see it. So I came prepared, despising myself, to resent any slight from another.

I soon became exasperated when I saw that to the critic I have spoken of Madame Reichstein ostentatiously paid special attention this night. She flirted with him in the most fearless and determined manner; it appeared to me, with some definite purpose: whether for the discomfiture of myself or Mr. Lyndon I could not determine. The critic, who had flirted doubtless with all the *prima donnas* of the previous ten years, entered very vivaciously into the game, and of course took it in precisely the spirit in which it was started. But I chose to be deeply offended; and the more deeply I drank for comfort and desperation. I paid extravagant attention to a little Frenchwoman (a new singer) beside me, who was herself drinking Champagne with amazing zest. I either saw, or thought I saw, some smiles passing around at both of us, and especially it seemed to me that a look of surprise and contempt came up on the face of Christina's pet critic. Impelled by Heaven knows what idiotic impulse, I jumped on my feet and proceeded to address the astonished little company. I complained that I had been insulted; I poured out some frantic nonsense, especially composed of denunciations of critics and literary men. I saw Mr. Lyndon raise his double eye-glass, survey me coolly for a moment, and then drop his

glass and resume his conversation with his neighbor, as if nothing I could do ought to be surprising or worth any particular notice. Looks of anger, contempt, pity, or disgust were on every face, and one I could see even then wore an expression of such surprise and shame and sorrow, that it might almost have brought me back to my senses.

I believe I displaced the mirth, broke the good meeting. But I really am not quite certain how the matter ended, except that I was assisted to a cab by a brother artist and the very critic I had been so absurdly denouncing. And I have a pretty clear idea, as shame flashed a gleam of consciousness over me, that I heard the former say to the latter: "Never saw him like this before, I'm sure; can't think what came over him. He is a very good fellow generally, I can assure you."

And the critic replied: "Yes; I have no doubt he is a good fellow, and he has an uncommonly fine voice; but what a confounded fool he must be!"

LEO AND LUTHER.

THERE was joy at Rome in the year 1513, for Pope Julius, II. was dead. It was no unusual thing, indeed, for the Romans to rejoice at the death of a Pope. If there was any one the people of the Holy City contemned and hated more than all other men it was usually their spiritual father, whose blessings they so devoutly received; and next to him his countless officials, who preyed upon their fellow-citizens as tax-gatherers, notaries, and a long gradation of dignities. But upon Julius, the withered and palsied old man, the rage of the people had turned with unprecedented vigor.¹ He had been a fighting Pope. His feeble frame had been torn by unsated and insatiable passions that would have become a Cæsar or an Alexander, but which seemed almost demoniac in this terrible old man. His ambition had been the curse of Rome, of Italy, of Europe; he had set nations at enmity in the hope of enlarging his temporal power; he had made insincere leagues and treaties in order to escape the punishment of his crimes; his plighted faith was held a mockery in all the European courts; his fits of rage and impotent malice made him the laughing-stock of kings and princes; and the cost of his feeble wars and faithless alliances had left Rome the pauper city of Europe.

And now Julius was dead. The certainty that his fierce spirit was fled forever had been tested by all the suspicious forms of the Roman Church. The Cardinal Camerlengo stood before the door of the Pope's chamber, struck it with a gilt mallet, and called Julius by name. Receiving no answer, he entered the room, tapped

the corpse on the head with a mallet of silver, and then falling upon his knees before the lifeless body, proclaimed the death of the Pope.¹ Next the tolling of the great bell in the Capitol, which was sounded upon these solemn occasions alone, announced to Rome and to the Church that the Holy Father was no more. Its heavy note was the signal for a reign of universal license and misrule. Ten days are always allowed to pass between the death of a Pope and the meeting of the conclave of cardinals for the election of his successor, and during that period it was long an established custom that Rome should be abandoned to riot, bloodshed, pillage, and every species of crime. The very chamber of the dead Pope was entered and sacked. The city wore the appearance of a civil war. The papal soldiery, ill paid and half fed, roamed through the streets robbing, murdering, and committing a thousand outrages unrestrained. Palaces were plundered, houses sacked, quiet citizens were robbed, murdered, and their bodies left in the streets or thrown into the Tiber. "Not a day passed," wrote Gigli, an observer of one of these dreadful saturnalia, "without brawls, murders, and waylayings." At length the nobles fortified and garrisoned their palaces, barricades were drawn across the principal streets, and only the miserable shop-keepers and tradesmen were left exposed to the outrages of the papal banditti.²

Meantime the holy conclave of cardinals was summoned to meet for the election of a successor to St. Peter. The whole of the first-floor of the Vatican, an immense range of apartments, now no longer used for electoral purposes, was prepared for the important occasion. Within its ample limits a booth or cell was provided for each cardinal, where he lived during the sitting of the assembly separate from his fellows. The booths were distributed by a raffle. A certain number of attendants, called conclavists, were allowed to the cardinals, who remained shut up with them during the election, and whose privilege it was to plunder the cell of the newly chosen Pope the moment the choice was announced.³

Before the final closing of the assembly to the world the Vatican presented a gay and splendid scene. All the great and noble of Rome came to visit the cardinals in their cells. Princes and magnates, foreign ambassadors and political envoys from the various Catholic powers, aspiring confessors and diplomatic priests, hurried from cell to cell on that important afternoon, whispering bribes, flatteries, or threats into each sacred ear; electioneering with all the ardor of a village politician for their favorite candidate, or the choice of their mighty courts at home; or indicating in distinct menace those

¹ He was in the habit of using his pastoral staff to punish dull bishops—probably its original design. De La Châtre, Hist. des Papes. Dèsque Jules II. eut terminé son exécrable vie. Roscoe and Ranke are more favorable to Julius.

¹ I have assumed that all the usual formula were employed at the death of Julius.

³ The physician of the Cardinal de' Medici was admitted to attend him.

persons whom Austria, France, and Spain would never suffer to wear the triple crown. At three hours after sunset a bell was heard ringing loudly, and the Master of Ceremonies coming forward called out, *Extra omnes*. The vast and busy throng was slowly and reluctantly dispersed. The last persuasion was offered, the last bribe promised, the last threat of haughty Bourbons or Hapsburgs whispered, and the gorgeous assembly of electioneering princes and ambassadors melted away along the dusky streets of Rome.

The cardinals were now shut up in close confinement.¹ All the windows and doors of the lower floors of the Vatican had been walled up except the door at the head of the principal staircase, which was secured by bolts and bars. By the side of this entrance were placed turning-boxes like those used in convents or nunneries, through which alone the imprisoned cardinals were allowed to hold any intercourse with the outer world; while whatever passed through these was carefully inspected by officers both within and without. Guards of soldiers were posted around the palace to insure the isolation of the holy prisoners, and the anathema of the Church was denounced against any cardinal or conclavist who should reveal the secrets of the inspired assembly. To insure a speedy decision, however, a somewhat carnal device had been lighted upon. It was ordered that if after three days the cardinals should have made no choice, they should each be confined to a single dish at every meal; if they remained obstinate for five days longer they must be restricted in their diet to bread, wine, and water alone as long as the session continued.

All the cumbrous forms employed at a papal election have been gradually introduced by the Popes themselves, and were designed to strengthen and complete the supremacy of the Chief Pontiff.² In the early ages of the Church the Popes were elected by the assembled clergy and people of Rome, and the sacred privilege was cherished by the turbulent Romans as their most valued possession. But the pontiffs, as they advanced in earthly power and grandeur, began to disdain or dread the tumultuous throng from whence they derived their holy office; and Nicholas II., in 1059, under the guidance of the haughty Hildebrand, snatched the election of the Popes from the people and placed it in the hands of the cardinals alone. None but the college of cardinals from that time have had any vote in the choice. But France, Austria, and Spain are each allowed to veto the election of some single cardinal. Custom, too, has sanctioned that none but a cardinal shall be chosen, and the bull of Nicholas II. promises or suggests that the successful candidate shall come from the bosom of the Roman prelacy.³

Pope Alexander III. added the provision that a vote of two-thirds of the college should be necessary to a choice; while Gregory X., elected in 1271, called together a General Council at Lyons (1274), where many abuses of the past were reformed, and the ceremonial of election arranged nearly in the form in which it now exists. Each cardinal has a single vote, and his right of suffrage can scarcely be taken from him even by the Pope himself. It is looked upon as a privilege almost immutable. Cardinals covered with crimes and shut up in St. Angelo have been taken from their prison to the sacred college, and then, when they had voted, were sent back to their dungeon. Cardinals convicted of poisoning or attempts to murder have regained, on the death of a Pope, their official privilege of aiding in the election of a successor to St. Peter. But Cardinal Rohan was degraded from all his offices for his share in the affair of the Diamond Necklace; and during the French Revolution two cardinals renounced their sacred dignity, and were held to have lost even their right of voting. Yet the cardinals, the princes of the Roman Church, form an immutable hierarchy independent in some respects of the Chief Pontiff himself; from their body the new Pope must be chosen; to them, on the death of a Pope, falls the selection of his successor; and their elevated position as the creators of the vicegerent of Heaven would seem naturally to require that they should display in the highest degree the purest traits of Christian virtue.

In the sacred college that assembled on the death of Julius II. were gathered a band of men corrupted by power, avaricious, venal, unscrupulous, and capable of every crime. One had been engaged in the plot for the assassination of Lorenzo de' Medici. One was a poisoner and a murderer of old standing. Most of them had been educated in the horrible school of the Borgias.¹ Scarcely one that was not a shame and horror to the eyes of pious men; scarcely one who was not ready with the dagger and the bowl. Ambitious of power, eager for the plunder of the Church, the conclave resolved to choose a Pope who would give them little trouble, whom they could mould and intimidate, and from whom they could extract at will the largest revenues and the richest benefices.² Such a man seemed the Cardinal de' Medici, the second son of Lorenzo the Magnificent, of Florence. He was the most polished and elegant prelate of his time. His disposition was mild and even, his person graceful and imposing, his generosity unbounded, and his love for letters and his familiarity with literary men had thrown around him an intellectual charm which was felt even by the coarsest of his contemporaries. But above all it was believed in the sacred college that his nature was

so soft and complying that he would readily yield up the government of the Church to the bolder spirits around him. Yet the contest within the walls of the Vatican lasted for seven days,¹ during all which time the bland Cardinal de' Medici, with the usual policy of his race, was engaged in secretly or openly promoting his own election. He softened and subdued his enemies by flatteries and promises; he was seen talking in a friendly and confidential way with Cardinal San Giorgio, the assassin of his uncle; he won Soderini, the persecutor of his race, by ample expectations; all the cardinals connected with royal families were especially favorable to the descendant of a line of princely money-lenders; the holy college yielded to the claim of the graceful Medici, and a majority of ballots inscribed with his name were found in the sacred chalice. Then a window in the Vatican was broken open, and Leo X. proclaimed Pope to the assembled people of Rome. He was placed in the pontifical chair and borne to St. Peter's, followed by the rejoicing populace, the excited clergy, the holy conclave; and as the procession passed on its way cannon were discharged, the populace applauded, and the long train of ecclesiastics, transported by a sudden fervor, broke out into a solemn strain of praise and glory to the Most High.

Giovanni de' Medici was the descendant of that great mercantile family at Florence which had astonished Europe by its commercial grandeur and elegant taste, and whose founders had learned complaisance and democracy in the tranquil pursuits of trade.² Their fortunes had been built upon industry, probity, politeness, and a careful attention to business. They had long practiced the virtues of honor and good faith when their feudal neighbors had been distinguished only by utter insincerity. The Medici had increased their wealth from father to son until they became the richest bankers in Europe, and saw the mightiest kings, and a throng of princes, priests, and warriors, suppliants at their counters for loans and benefits, which sometimes they never intended to repay. At length Lorenzo, the father of Leo X., retired from business to give himself to schemes of ambition, and to guide the affairs of Italy. His immense wealth, pleasing manners, prudence, and good sense made him the most eminent of all the Italians: unhappily Lorenzo sank from the dignity of an honest trader to share in the ambitious diplomacy of his age, and lost his virtue in his effort to become great. Giovanni was his favorite son—the only one that had any ability; and Lorenzo had resolved, almost from his birth, that he should wear the triple crown.

At seven years of age Giovanni was made an abbot. His childish head was shaven with the monkish tonsure. He was addressed as Mes-

sire, was saluted with reverence as one of the eminent dignitaries of the Church, and was supposed to control the spiritual concerns of various rich benefices. The child-abbot soon showed an excellent intellect, and, under the care of Politian, became learned in the rising literature of the day. All that the immense wealth and influence of his father could give him lay at his command. He was educated in the magnificent palace of the Medici which Cosmo had complained was too large for so small a family, shared in those lavish entertainments of which Lorenzo was so fond, was familiar with the wits, the poets, the painters of that gifted age, and learned the graceful skepticism that was fashionable at his father's court. When Giovanni was thirteen¹ Lorenzo resolved to raise him to the highest dignity in the Church below that of the Supreme Pontiff. He begged the Pope, with prayers that seem now strangely humiliating, to make his son a cardinal. He enlisted in his favor all whom he could influence at the papal court. "It will raise me from death to life," he cried, when the Pope seemed to hesitate. The boon was at last obtained, and the boy of fourteen, the child of wealth and luxurious ease, with no effort of his own, became one of the chief priests of Christendom. The Pope, however, with some show of propriety, required that the investiture should not take place in three years, during which time the young Medici was to give his attention to study. Politian still directed his studies. Giovanni was grave, graceful, formal, ambitious; and at seventeen, in the year 1492, so fatal to the glory of his family, he took his place in the sacred college at Rome, and was received in the Holy City with a general respect that seemed not unworthy of its future master.

Meanwhile, far away in a little hamlet of Germany, a beggar-child was singing mendicant songs from door to door, and living upon the insufficient alms which he won from the compassion of the charitable. It was a delicate and feeble boy, to whom childhood offered no joys, whose youth was a perpetual woe. Luther was a peasant's son, and all his ancestors had been peasants.² His father was a miner in the heart of the Thuringian forest. The manners of the peasants were harsh and cruel: Luther's parents drove him out to beg; his mother sometimes scourged him till the blood came for a trivial offense; his father punished him so severely and so often that the child fled from his presence in terror; and his little voice, as he chanted his mendicant hymns, must often have been drowned in tears. Yet so sweet and tender was the heart of the great reformer that he ever retained the most sincere love and reverence for the parents whom poverty and their own sufferings had made so severe. He was ever a fond and dutiful son. He wept bitterly,

like Mohammed, over his mother's grave. He was proud to relate that his father won a hard and scanty living in the mines of Mansfield, and that his mother carried wood from the forest on her back to their peasant home; and when he came to stand before Europe the adversary of the elegant Leo, and the companion of kings and princes, he was never weary of modestly boasting that he was a peasant's son.¹

Luther was eight years younger than the Cardinal de' Medici. He begged his education at Eisenach, a small German town, until he was thirteen, and was then maintained by a charitable relative. Afterward his father, who had thriven by industry and toil, was enabled to send his son to the university at Erfurth, and hoped to make him a lawyer.² But now that mighty intellect, which was destined to spread its banyan-like branches over Europe and mankind, began to flourish with native vigor. Luther's rare versatility embraced every form of mental accomplishment. He loved music with intense devotion; his sensitive frame responded to the slightest touch of instrumental sounds; he believed that demons fled at the sound of his flute; and when he had fallen into one of his peculiar trances in his cell, his fellow-monks knew that music was the surest medicament to bring him back to consciousness and activity.³ He was a poet, and his religious impulses often expressed themselves in sacred songs—rude, bold, and powerful—that have formed the germ and model of those of many lands. His love for pure literature was in no degree inferior to that of his elegant rival, Leo X.; he studied day and night the few works of classic or medieval writers that were then accessible to the humble scholar or the penniless monk; and his craving mind was never sated in its ceaseless appetite for knowledge. Yet his disposition was never saturnine or desponding; as a student he was often gay, joyous, and fond of cheerful company; his tuneful voice was no doubt often heard at convivial meetings at Erfurth; his broad and ready wit must have kept many a table in a roar; and his loving heart seems to have gathered around him many friends. So varied were his tastes, so vigorous his powers, that in whatever path his intellect had been directed he must have risen high above his fellow-men. He might have shone as a lawyer and a famous statesman; he might have been the Homer of Germany, or the author of a new *Nibelungenlied*; his classic taste might easily have been turned to the revival of letters; his musical powers have produced an earlier Mozart; or his rare and boundless originality have been expended in satiric or tragic pictures of that world around him of whose folly and dullness he had so clear a conception.

One day Luther was walking through the

fields with one of his young companions from his father's home in the forest to Erfurth.¹ It was July, and suddenly a fierce storm gathered over the bright sky; the mountains around were hid in gloom; the lightning leaped from cloud to cloud; all nature trembled; when a sharp bolt from heaven struck Luther's companion dead at his side, and left him for a time senseless beside him. He wandered home on his solitary way, oppressed with an intolerable dread; he believed that he had heard the voice of Heaven calling him to repent; he vowed that he would give his whole future life to asceticism and monastic gloom. The next evening, with the impulsive inconstancy of youth, he passed with his young companions in the pleasures of music, wine, and song, anxious perhaps to try if he could drown in the joys of the world the pains of a wounded spirit. But the next day he hastened to the convent of the Augustines at Erfurth, and took the irrevocable vow.² He resolved, by the practice of the severest austerity, to escape the pains of purgatory. He was the most faithful of ascetics. All his great powers, all the joyousness of his youthful spirit, all the abundant growth of his fertile intellect, were shut up in a narrow cell and wasted in the closest observance of monkish rites. And the result was sufficiently appalling. He was weighed down by an ever-increasing consciousness of sin. Despair and death seemed his only portion. His life was agony, and sometimes he would sink down in his cell in a deep swoon, from which he could only be aroused by the gentle touch of a stringed instrument.³

While Luther was thus passing through the rude ordeal of his painful youth his companion spirit, the elegant Cardinal de' Medici, had glided gracefully onward in a career of unsullied prosperity.⁴ His sins had never given him any trouble. His conscience was soothed and satisfied by the united applause of all his associates. The learned Politian, a polished pagan, wrote in the most graceful periods of his piety and decorum. His father, Lorenzo, had never been weary of spreading the report of his early fitness for the highest station in the Church. He was looked upon as an especial ornament to the sacred college of cardinals; and the Cardinal himself seems never to have doubted his own piety, or to have shrunk from the responsibility of holding in his well-trained hands the destiny of the Christian world. For him purgatory had no terrors; the future world was a fair and faint mirage over which he aspired to spread his sceptre in order to rebuild St. Peter's or to immortalize his reign; but beyond that he seems scarcely to have looked within its veil. That future upon which Luther gazed with wild, inquiring eyes, for Leo

seemed scarcely to exist. He was more anxious to know with Cicero what men would be saying of him six hundred years from now; or more engaged in speculating upon his own prospect of filling with grace and dignity the chair of St. Peter.

At eighteen the young Cardinal seems almost to have attained the maturity of his physical and mental powers. He was tall, handsome, graceful, intellectual. His complexion was fair and florid, his countenance cheerful and benignant. He was famed for the magnificence of his entertainments, his love of display, his unbounded extravagance, his open generosity. He wasted his father's wealth, as afterward his own, in feasts, processions, and deeds of real benevolence. He was the spendthrift son of an opulent parent; he became the wasteful master of the resources of the Church. Like Luther, he was passionately fond of music. He played and sang himself; he studied his art with care; and his leisure hours were seldom without musical employment. Like Luther, too, he loved letters with a strange and surpassing regard. Reading was his chief pleasure, and he seldom sat down to table without having some poem or history before him, or without lengthening his repast by reading aloud fine passages to his literary friends. He had some imperfect sense of the real power of the intellect, and the man of letters was always to Leo a kind of deity whom he was glad to worship or to approach. But his own productions are never above mediocrity, and the real genius that glowed in the breast of Luther was an inscrutable mystery to the ambitious Pope.

Calamity in a magnificent form at length came even to the prosperous Cardinal. In 1492 his father Lorenzo died, and two years afterward the Medici were driven out of Florence. Savonarola,¹ the Luther of Italy, the gifted monk whose fierce eloquence had transformed the skeptical Florentines from pagan indifference to puritanic austerity,² who had preached freedom and democracy, who had inveighed against the vices of the clergy and the despotism of Rome, and whose fatal and unmerited doom must have been ever before the mind of his German successor, became for a time the master of his country. Florence was once more a republic, the centre of religious reform. The theatres were closed, the spectacles deserted, and the churches were filled with immense throngs of citizens who were never weary of listening to the stern rebukes of the inspired monk. But in 1494 Savonarola fell before the intrigues of his enemy, Alexander VI., the Borgia; he was hanged, his body burned, and his ashes cast into the Arno.³ The Church triumphed in the destruction of its saintly victim; but the Medici were exiles from their native city

for eighteen years, and were only restored in 1512, by the favor of Julius II. and the arms of the Spaniards. During this long period of misfortune the Cardinal lived in great magnificence, and wasted much of his fortune. Poverty even threatened him who had never known any thing but boundless wealth. In the fearful reign at Rome of Alexander VI. and Cæsar Borgia he wandered over Europe, visited Maximilian in Germany, and his son Philip in the Low Countries; passed over France, paused a while at Marseilles, and then returned to Italy.¹ Here, at the town of Savona, met at table three exiles, each of whom was destined to wear the papal crown: Rovere, afterward Julius II.; the Cardinal de' Medici, Leo X.; and Giuliano de' Medici, afterward Clement VII. When Julius was made Pope the Cardinal de' Medici returned to Rome, and became the chosen adviser of that pontiff. He shared in the various unsuccessful attempts of his family to regain their control over Florence, was often in command of the papal armies, and shone in the camp as well as the court; saw in 1512 the restoration of the Medici to Florence; and the next year, on the death of his friend Julius II., was enthroned as Pope at Rome—the magnificent Leo X.

In the close of the reign of Julius, Luther visited Rome. The poor monk, worn with penances and mental toil, was sent upon some business connected with his convent to the papal court.² He crossed the Alps full of faith and stirred by a strong excitement. He was about to enter that classic land with whose poets and historians he had long been familiar: he was to tread the sacred soil of Virgil, Cicero, and Livy. But, more than this, he saw before him, rising in dim majesty, the Holy City of that Church from whose faith he had never yet ventured to depart, whose supreme head was still to him almost the representative of Deity, and whose princes and dignitaries he had ever invested with an apostolic purity and grace. Rome, hallowed by the sufferings of the martyrs, filled with relics, and redolent with the piety of ages, the untutored monk still supposed a scene of heavenly rest. "Hail, holy Rome!" he exclaimed, as its distant towers first met his eyes. His poetic dream was soon dispelled. Scarcely had he entered Italy when he was shocked and terrified by the luxury and license of the convents, and the open depravity of the priesthood. He fell sick with sorrow and shame. He complained that the very air of Italy seemed deadly and pestilential. But he wandered on, feeble and sad, until he reached the Holy City, and there, amidst the mockery of his fellow-monks and the blasphemies of the impious clergy, performed with honest superstition the minute ceremonial of the Church. Of all the pilgrims to that desecrated shrine none was so devout as Luther. He was determined, he said, to escape the pains of purgatory, and win a plenary

¹ Jovius admits the eloquence of Savonarola.

² Walch, xxiv. p. 102 *et seq.*

indulgence: he dragged his frail form on his knees up the painful ascent of the Holy Stairs, while ever in his ears resounded the cry, "The just shall live by faith." He heard with horror that the head of the Church was a monster stained with vice; that the cardinals were worse than their master; the priests, mocking unbelievers; and fled, heart-broken, back to his German cell.

On the 11th of April, 1513, Leo X. opened his splendid reign by the usual procession to the Lateran, but the magnificence of his pageant was such as had never been seen at Rome since the fall of the Western Empire. It was the most imposing and the last of the triumphs of the undivided Church. The Supreme Pontiff, clothed in rich robes glittering with rubies and diamonds, crowned with a tiara of precious stones of priceless value, and dazzling all eyes by the lustre of his decorations, rode on an Arab steed at the head of an assembled throng of cardinals, ambassadors, and princes. The clergy, the people of Rome, and a long array of soldiers in shining armor, followed in his train. Before him, far away, the streets were spread with rich tapestry, spanned by numerous triumphal arches of rare beauty, and adorned on every side by countless statues and works of art. Young girls and children, clothed in white, cast flowers or palms before him as he passed. A general joy seemed to fill the Holy City; the sacred rites were performed at the Lateran with a just decorum; and in the evening of the auspicious day Leo entertained his friends at a banquet in the Vatican, whose luxury and extravagance are said to have rivaled the pagan splendors of Apicius or Lucullus.

And now began the golden age of Leo X.¹ The descendant of the Medici ruled over an undivided Christendom. But lately his spiritual empire had been enlarged by the discoveries of Columbus and Gama, and the conquests of the Spaniards and Portuguese. India and America lay at the feet of the new Pope. In Europe his authority was greater than that of any of his predecessors. The Emperor of Germany, the kings of England, France, and Portugal, became at length his obedient vassals. Henry, Charles, and Francis looked to the accomplished Leo for counsel and example, and paid sincere deference to the court of Rome. He was the master-spirit of the politics of his age, and the three brilliant young monarchs, whose talents seemed only directed to the ruin of Europe and of mankind, were held in check by the careful policy of the acute Italian. With the clergy Leo was still more successful. He was the idol of the priests and bishops of the Continent and of England. In Germany his name stood high as a man of probity and dignity; Luther avowed his respect for the pontiff's character; in England

Wolsey led the Church to his support. A common delusion seems to have prevailed that Leo was either sincerely pious or singularly discreet. The people, too, so far as they were familiar with the pontiff's name, repeated it with respect. Compared with the passionate, licentious Julius, or the monster Alexander, he seemed of saintly purity; while the scholars of every land united in spreading the fame of that benevolent potentate whose bounty had been felt by the humblest of their order, as well as the most renowned.

The age of Leo X. was golden with the glories of art.¹ He was the most bountiful and unwearied friend of intellect the world has ever seen. His most sincere impulse was the homage he paid to every form of genius. Ambitious students and impoverished scholars hastened to Rome with their imperfect poems and half-finished treatises, submitted them to the kindly critic, were received with praise and just congratulation, and never failed to win a rich benefice or a high position at the papal court. Leo read with fond and friendly attention the first volume of Jovius's history, pronounced him a new Livy, and covered him with honors and emoluments. He made the elegant style of Bembo the source of his wealth and greatness. He made the learned Sadoleto a bishop; he cultivated the genius of the graceful Vida. For Greek and Latin scholars his kindness was unwearied; he aided Aldus by a liberal patent, and sought eagerly for rare manuscripts of the Greek and Latin classics. His hours of leisure were often passed in hearing some new poem or correcting some unpublished manuscript; his happiest days were those he was sometimes enabled to spend amidst a throng of his friendly authors. For science he was no less zealous, and mathematicians, astronomers, geographers, and discoverers were all equally sure of a favorable reception at Rome. Leo was always eager to hear of the strange adventures of the Spanish and Portuguese in the unknown lands, to converse with the brave Tristan Cunha, or to listen to Pigafetta's unpolished narrative of Magellan's wonderful voyage.

Thus for eight years Rome echoed to the strains of countless rival or friendly bards who sang to the ever-kindly ear of the attentive pontiff, and a vast number of poems in Latin or Italian rose to renown, were quoted, admired, praised as not unworthy of Virgil or Catullus, and then sank forever into neglect. Of all the poets of this fertile age scarcely one survives.² The historians have been more fortunate. Machiavelli, Guicciardini, perhaps Jovius, are still remembered among the masters of the art. Castiglione is yet spoken of as a purer Chesterfield; the chaste and gifted Vittoria Colonna still lives as one of the jewels of her sex. But it is to its painters rather than its poets that this illustrious epoch owes its im-

¹ Jovius. Auream ætatem post multa sæcula condidisse.

¹ Jovius, p. 109.

² Roscoe, Leo X.

mortality. It is to Raffaello that Leo X. is indebted for many a lovely reminiscence that aids in rescuing his glory from oblivion. The traveler who wanders to Rome is chiefly reminded of Leo by the graceful flattery with which the first of painters has interwoven the life of his friend and master with his own finest works. He sees the portrait and exact features of Leo X. in the famous picture of Attila; discovers an allusion to his life in the Liberation of St. Peter; or remembers that it was to the taste and profuse liberality of the pontiff that we owe most of those rare frescoes in the Vatican with which Raffaello crowned his art.

All through the brief period of scarcely seven years, so wonderful and varied were the labors of Raffaello, so constant the demands of the friendly but injudicious Pope, that we might well suppose the two friends to have been incessantly occupied in their effort to revive and recreate the ancient glory of Rome. To Raffaello these years were spent in fatal toil. His fancy, his genius were never suffered to rest.¹ Gentle, loving, easily touched, and fired by artistic ambition, soft and luxurious in his manners, unrestrained by moral laws, the great painter yielded to every wish of the eager Pope with an almost affectionate confidence, reflected all Leo's high ambition and longing after fame, toiled to complete St. Peter's, to adorn the Vatican, to perfect tapestries, paint portraits, to discover and protect the ancient works of art, to rebuild Rome; until at last, in the spring of 1520, his genius faded away, leaving its immortal fruits behind it. Other painters of unusual excellence took his place, but an illimitable distance separates them all from Raffaello.

Two great names are wanting to the splendid circle of Leo's court, and neither Ariosto nor Michael Angelo can be said to have belonged to his golden age. They seem to have shrunk from him almost with aversion. Ariosto was the only true genius among the poets of his time.² His varied fancy, his brilliant colors, are the traits of the true artist. He had early been the friend of Leo before he became Pope; he went up to Rome to congratulate the pontiff on his accession; but some sudden coldness sprang up between the poet and the Pope which led to their complete estrangement. Ariosto was never seen at the banquets and splendid pageants of the Holy City; his claims were neglected, his genius overlooked; and the author of Orlando Furioso lived and died in poverty, while Accolti and Aretino glittered in the prosperity of the papal court. Michael Angelo, too, stood aloof from the pontiff. His clear eye saw through the jewels and gold with which Leo had decked himself to the corruption of his inner life. Luxurious, licentious Raffaello might consent to obey the imperious will of the graceful actor, but his rival and master lived in a stern isolation. He preferred the conversa-

tion and the correspondence of the dignified Vittoria Colonna to the luxurious revelry of Leo and his satyr train.

But Leo cared little for the absence of those whose deeper sensibilities might have disturbed the progress of his splendid visions. It was enough for him that he was the Sovereign Pontiff; that he wore the tiara to which he had been destined from his birth. His life was to himself a complete success. It was passed in revelries and pageants, in the society of the rarest wits and the greatest of painters, in the government of nations and the defense of Italy. He was almost always cheerful, hopeful, busy, full of expedients. He lived seemingly unconcerned amidst a band of poisoners who were always plotting his death, and a circle of subject princes who might at any moment overthrow his power. He smiled while the glittering sword hung over his head, and snatched the pleasures of life on the brink of a fearful abyss. To carry out his favorite plan, the elevation of his family to the regal rank, he had done many evil deeds. He robbed a Duke of Urbino of his patrimony through war and bloodshed; had driven the Petrucci from Siena; was the relentless despoiler of the small states around him. Italy mourned that the Medici might become great. Yet so shrunken in numbers was the famous mercantile family that of the direct legitimate descendants of Cosmo, Leo and his worthless nephew Lorenzo were all that were left. Lorenzo, a drunkard and a monster of vice, was the ruler of Florence, and for him Leo despoiled the Duke of Urbino; to advance Lorenzo was the chief aim of his politics. He married him, at length, to Madeline of Tours; he incurred a vast expense to make him great; but, happily for Florence, Lorenzo not long after died, leaving a daughter, the infamous Catherine de' Medici, the persecutor and the murderess; and thus a descendant of Cosmo de' Medici became the mother of three kings of France.

In the eyes of Europe Leo seemed the most fortunate of men, the most accomplished of rulers, a model Pope. The manners and the gayeties of Rome and Florence were imitated in the less civilized courts of England, France, and Germany. The respect which Leo ever paid to artists, scholars, and men of letters led Francis, Charles, and Henry VIII. to become their patrons and their friends. Literature became the fashion. The polished student Erasmus wandered from court to court and was every where received as the companion of kings and princes. Henry VIII. aspired to the fame of authorship and wrote bad Latin. Francis cherished poets and painters. Even the cold Charles V. caught the literary flame. Yet the manners of the court of Rome can scarcely be called refined. Leo was fond of coarse buffoonery and rude practical jokes. He invited notorious gluttons to his table, and was amused at the eagerness with which they devoured the costly viands, the peacock sausages, or the rare

¹ Roscoe, Leo X., ii. p. 110.

² Id., p. 122.

confections.¹ He was highly entertained by the sad drollery of idiots and dwarfs. A story is told of Baraballo, a silly old man of a noble family, who wrote bad verses and thought himself another Petrarch. Leo resolved to have him crowned like Petrarch in the Capitol. A day was appointed for the spectacle, costly preparations were made, and the silly Baraballo, decked with purple and gold, and mounted upon an elephant, the present of the King of Portugal, was led in triumph through the streets of Rome, amidst the shouts of the populace and the clamor of drums and trumpets.² At the bridge of St. Angelo the elephant, more sensible than his rider, refused to go any further; Baraballo was forced to dismount; all Rome was filled with laughter; and Leo commemorated his unfeeling joke by a piece of sculpture in wood, which is said to be still in existence. Leo was also passionately fond of hunting. No calls of business, no inclemency of the weather, could keep him from his favorite sport. He was never so happy as when shooting partridges and pheasants in the forests of Viterbo, or chasing wild boars on the Tuscan plains. To the fine ceremonial of his Church he is said to have been unusually attentive. He fasted often, intoned with grace, and his love for music led him to gather from all parts of Europe the sweetest singers and the most skillful instrumental performers to adorn the Roman churches.

Thus Leo glided gracefully onward, an accomplished actor, always conscious that the eye of Europe was upon him, and always elegant, polite, composed. Yet there must often have been moments when his gracious smile covered an inward agony or a secret terror. His handsome, stately form was always internally diseased; he suffered fierce pangs of pain which he told to few; and often, as he presided at the gay banquet or some stormy meeting of his holy college, he must have mastered with iron energy the terrible agony inflicted by a hidden disease. But far worse even than actual suffering was the constant dread in which he must have always lived. He was surrounded by poisoners who sought his life. His daily associates were those most likely to present to him the deadly draught. It was the holy college that had resolved upon his destruction.

The cardinals formed a plot to poison the Pope.³ He had disappointed them in living when they had looked for his speedy death, and he had never been able to gratify the boundless claims they had made upon the sacred treasury. They were the most resolute and unwearied of beggars. "You had better at once take my tiara," said the weary pontiff when he was once surrounded by the holy mendicants; and he ever after was hated by most of his cardinals. Among them, too, were several who had some private reason for seeking Leo's death. The author of the plot, Alfonso Petrucci, had lost his revenues

at Sienna by the fall of his family in that city, and had vowed revenge. He was a young man, fierce, dissolute, gay, feeble. He was accustomed to proclaim openly among his wild companions his hatred for Leo and his plans of vengeance. Often he came to the meetings of the sacred college with a dagger hidden in his breast, and was only withheld from plunging it in Leo's heart by the fear of seizure. At length he concerted with a famous physician the plan of poison. The most eminent man in the college of cardinals was Riario, Cardinal San Giorgio. He was the wealthiest of his order. He had been a cardinal for forty years. In his youth he had shared in the plot to murder Lorenzo de' Medici, and now in his old age he aided Petrucci in his design against Leo. He hoped on the Pope's death to become his successor. Another conspirator was the Cardinal de' Sauli, who had furnished Petrucci with money. Another, Soderinus, the enemy of the Medici, from Florence. The last was the silly Adrian of Corneto. This foolish old man had been assured by a female prophet that the successor to Leo would be named Adrian, and felt sure that no one but himself could be meant. It was observed that the soothsayer spoke truly, and that the next Pope was Adrian; but not the poisoner. How many others of the college were engaged in the plot is not told. Happily Leo had been watching Petrucci for some time, and intercepted a letter that revealed the whole design. Petrucci was absent from Rome, and Leo, in order to get him into his power, sent him a safe-conduct, and even assured the Spanish ambassador that he would observe it. The conspirator came laughing boastfully to the city. He was at once seized and shut up in the castle of St. Angelo with his friend De' Sauli; and Leo excused his own bad faith by alleging the enormity of the crime.

Pale, agitated, trembling, the Pope now met his cardinals in the consistory. There was scarcely one to whom he could trust his life. He was surrounded by secret or open assassins, and he might well fear lest a dagger was hidden beneath each sacred robe.¹ He addressed them, however, with his usual dignity; he complained that he, who had always been so kind and liberal to them, should thus be threatened by their conspiracies. Riario, the head of the college, was already under arrest; Petrucci and De' Sauli were confined in horrible dungeons. The Cardinal Soderini fell down at Leo's feet, confessing his guilt, and the foolish Adrian was equally penitent. In his punishment of the offenders Leo showed all the severity of his nature. Petrucci was strangled in prison, De' Sauli was released on paying a heavy fine, but died the next year, it was believed of poison. Riario, the venerable assassin, was also fined heavily and forgiven. Poor Adrian fled from Rome, with the loss of his estate, and was never heard of more. Thus Leo broke forever the power of his ene-

¹ Jovius, p. 99. ² Id., p. 97. ³ Id., p. 88, 89.

¹ Jovius, p. 89. Guicciard., xiii.

mies, the sacred college, and at the same time replenished his treasury by the confiscation of their estates. Soon after, by a vigorous stroke of policy, he created thirty-one new cardinals; in many cases the office was sold to the highest bidder, and thus Leo was once more rich and happy.¹ He was now (1517) at the height of his power. The Church was omnipotent, and Leo was the Church. His cardinals never afterward gave him any trouble; every heretic had been suppressed or burned; the city of Rome was the centre of civilization as well as of religion; money flowed in upon it from all the world; and the lavish pontiff wasted the treasures of the Church in every kind of magnificent extravagance.

It was because Leo was a splendid spendthrift that we have the Reformation through Luther. The Pope was soon again impoverished and in debt. He never thought of the cost of any thing; he was lavish without reflection. His wars, intrigues, his artists and architects, his friends, but above all the miserable Lorenzo, exhausted his fine revenues; and his treasury must again be supplied. When he was in want, Leo was never scrupulous as to the means by which he retrieved his affairs; he robbed, he defrauded, he begged; he drew contributions from all Europe for a Turkish war, which all Europe knew had been spent upon Lorenzo; he collected large sums for rebuilding St. Peter's, which were all expended in the same way; in fine, Leo early exhausted all his spiritual arts as well as his treasury.²

Suddenly there opened before his hopeless mind an El Dorado richer than ever Spanish adventurer had discovered, more limitless than the treasures of the East and West. It was Purgatory. Over that shadowy realm the Pope held undisputed sway. The severest casuist of the age would admit that the spiritual power of the Church was in that direction limitless. It was nearly a hundred years since Tauler, the German reformer, had suffered martyrdom for denying that the Pope could condemn an innocent man to eternal woe or raise the guiltiest to the habitations of the blest; and from that hour the authority of the pontiff had been constantly increasing, until now he was looked upon as nothing less than Deity upon earth. He held in his polluted hands the key of immortality. But even had a doubt arisen as to the efficacy of the keys, the pious Aquinas had shown by the clearest argument that the Church possessed a boundless supply of the merits of the saints, and even of its Divine Head, which might be applied to the succor of any soul that seemed to require external aid. Leo seized upon the notion of the schoolmen and extended it to an extreme which they perhaps had never anticipated. He pressed the sale of his indulgences. He offered full absolution to every criminal who would pay him a certain sum of money, joined with contrition; without con-

trition, and for a similar payment, he offered to diminish the term for which any person was condemned to purgatory, or to set free from the pains of purgatory the departed spirit whose friends would pay a proper remuneration.¹ Over the shadowy land, in whose existence he can scarcely have believed, the pontiff presumed to extend his earthly sceptre—to divide it into periods of years, to map it out in distinct gradations, and to sell to the highest bidder the longest exemption or a swift release. It was a dreadful impiety, a horrible mockery, it was selling immortal bliss for money.

The indulgence was first used by Urban II., in the period of the first crusade, to reward those who took up arms for the relief of the Holy Land. It was then granted to any one who hired soldiers for the war; and was next extended to those who gave money to the Pope for some pious purpose. Julius II. had employed it to raise money to rebuild St. Peter's, and Leo X. sold his indulgences upon the same pretext.² But Leo's indulgence, as set forth by his agents in Germany, far excelled those of his predecessors in its daring assumption. It pardoned all sins however gross, restored its purchaser to that state of innocence which he had possessed at baptism, and at his death opened at once to him the gates of Paradise. From the moment that he had obtained this valuable paper he became one of the elect. He could never fall.³ Whatever his future crimes his salvation was assured. The honor of the Pope and the Church was pledged to secure him against any punishment he might merit in a future world, and to raise him at last to the society of the blessed. But probably the most attractive and merchantable part of the indulgence was that which set free departed spirits from purgatorial pains. This ingenious device played upon the tenderest and most powerful instincts of nature. What parent could refuse to purchase the salvation of a dead child? What son but would sell his all to redeem parents and relatives from purgatory? It was upon such themes that the strolling vendors of indulgences constantly enlarged. They gathered around them a gaping throng of wondering rustics; they stood by the village church-yard and pointed to the humble graves. "Will you allow your father to suffer," Tetzels cried out to a credulous son, "when twelve pence will redeem him from torment? If you had but one coat you should strip it off, sell it, and purchase my wares." "Hear you not," he would say to another, "the groans of your lost child in yonder church-yard? Come and buy his immediate salvation. No sooner shall your money tinkle in my box than his soul will ascend to heaven." Thus Leo made a traffic of immortal bliss. There is something almost sublime in his presumption. From his gorgeous

throne in the eternal city he stood before mankind claiming a divine authority over the world and all that it contained. Kings, emperors, princes were his inferiors and his spiritual serfs. He divided the globe between the Spaniards and Portuguese. His simple legate was to take the precedence of princes. It was the fashion of the churchmen of the day to magnify their office, to claim for it an immutable superiority, as if the office sanctified the possessor.¹ Conscious of their own impurity and hypocrisy, they sought, as is so often the case with immoral priests, to raise themselves above public scrutiny, and to create for themselves a position amidst the clouds of imputed sanctity, where, like their prototypes, the heathen gods, they might sin unchallenged. They looked down with contempt upon the too curious worshiper, who was unfit to touch their garments; they veiled themselves in the dignity of the office they degraded. But the earthly state assumed by the haughty priests was as nothing compared to their spiritual claims. The Popes professed to concentrate in themselves all the power and virtue of the Church. They were its despots.² The evil Alexander and the fierce Julius had condemned to eternal woe whoever should appeal to a council. Leo spoke to the world as its divine ruler. He was the possessor of all the merits of the saints and martyrs, and of the boundless sufficiency of Calvary. He ruled over the future world as well as the present;³ he could unfold the gates of paradise and snatch the guilty from the jaws of hell; his power extended over countless subjects in the shadowy world, whose destiny depended on his pleasure, and who were the slaves of his caprice.

The indulgences at first sold well. But their sale was chiefly confined to Germany.⁴ Spain, under the control of Ximenes, had long before refused to permit its wealth to be drained into the treasury of Rome. France was hostile to the Pope. England yielded only a small return. But over the dull peasants of Germany the acute Italians had succeeded in weaving their glittering web of superstition until that unhappy land had become the El Dorado of the Church. Every year immense sums of money had flowed from Germany to Rome for annats, palliums, and various other ecclesiastical devices; and now the whole country was divided into three great departments under the care of three commissions for the sale of indulgences.⁵ Itinerant traders in the sacred commodity passed from town to town and fair to fair, extolling the value of their letters of absolution and pressing them upon the popular attention. They were followed wherever they went by great throngs of people; and their loud voices, coarse jokes, and shameless eloquence seem to have been attend-

ed with extraordinary success. They are represented as having been usually persons of worthless characters and licentious morals, who passed their nights in drinking and revelry at taverns, and their days in making a mockery of religion; who proved the value of the plenary indulgence by the daring immorality of their lives. They were secure in the shelter of Rome, and had a safe-conduct to celestial bliss.

The Elector Frederick of Saxony was now the most powerful of the German princes. His dominions were extensive and wealthy; he was sagacious, firm, and honest; and he had always opposed with success the various efforts of the Popes to draw contributions from his priest-ridden subjects.¹ Frederick was already irritated against the Elector of Mentz, who had in charge the sale of indulgences; and he openly declared that Albert should not pay his private debts "out of the pockets of the Saxons." He saw with indignation that his people were beginning to resort in great numbers to the sellers of the pious frauds. But the resistance of Frederick to the religious excitement of the day would have proved ineffectual had he not been aided by an humble instrument whose future omnipotence he could scarcely have foreseen. It was to a poor monk that Saxony and Germany were to owe their deliverance from Italian priestcraft. Five years had passed since Martin Luther had returned from his pilgrimage to Rome with his honest conscience stricken and horrified by the pagan atmosphere of the Holy City. During that period the poor scholar had risen to eminence and renown.² He had become professor in the university at Wittenberg, which the Elector Frederick had founded; his eloquence and learning, his purity and his vigor, had given him a strong control over the students and the people of the small scholastic city. Already he had wrought a lesser reformation in the manners and the lives of the throngs who listened to his animated preaching; already he had even planned a general reform of the German Church. But as yet Luther had entertained no doubts of the papal supremacy. He still practiced all the austerity of penance, and still clung to all the formulas of his faith. The Pope was still to him a deity upon earth; Rome, the city of St. Peter and the martyrs; the fathers, an indisputable authority; and although he had learned to study the Scriptures with earnest attention, he yet interpreted them by the light of other consciences than his own. His honest intellect still slumbered under that terrible weight of superstition beneath which the cunning Italians had imprisoned the mind of the Middle Ages.

A shock aroused Luther from his slumber; a shock startled all Germany into revolt. The loud voice of the shameless Tetzels was heard in Saxony extolling his impious wares, and claim-

² Luther's *Briefwechsel*, by Burkhardt, 1866. He soon begins to correspond with the highest officials.

ing to be the dispenser of immortal bliss. His life had been one of gross immorality; he was an ignorant and coarse Dominican; his rude jokes and brutal demeanor, his revelries and his licentious tongue, filled pious men with affright. He ventured to approach Wittenberg, and some of Luther's parishioners wandered away to the neighboring towns of Jüterbock to join with the multitude who were buying absolution from the dissolute friar.¹ It was the decisive moment of modern history. The mightiest intellect of the age was roused into sudden action; the intellect whose giant strength was to shiver to atoms the magnificent fabric of papal superstition, and give freedom to thought and liberty to man. Luther rose up inspired. He wrote out in fair characters his ninety-five propositions on the doctrine of indulgences, and nailed them (1517) to the gates of his parochial church at Wittenberg. He proclaimed to mankind that the Pope had no power to forgive sin; that the just must live by faith. Swift as the electric flash which had won him from the world his bold thoughts rushed over Germany, and startled the corrupt atmosphere of Rome. It is related that just after his daring act the Elector Frederick, as he slept in his castle of Schweinitz, on the night of All Saints, dreamed that he saw the monk writing on the chapel at Wittenberg in characters so large that they could be read at Schweinitz; longer and longer grew Luther's pen, till at last it reached Rome, struck the Pope's triple crown, and made it tremble on his head. Frederick stretched forth his arm to catch the tiara as it fell, but just then awoke. All Germany dreamed a similar dream; it awoke to find it a reality.²

Germany was then no safe place for reformers or heretics. It was in a state of miserable anarchy and barbarism. The great cities, grown rich by commerce and honest industry, were engaged in constant hostilities with the robber knights whose powerful castles studded the romantic banks of the Rhine and filled the fastnesses of the interior.³ Often the long trains of wealthy traders on their way to Nuremberg or the fair at Leipzig were set upon by the lordly robbers, who sprang upon them from some castled crag, their rare goods ravished away, their hard-earned gains torn from them, and the prisoners hurried away to torture and dismal dungeons until they had paid an excessive ransom. Often rich burghers came back to their native cities from some unfortunate trading expedition impoverished, with one hand lopped off, and showing their bleeding arms to their enraged fellow-citizens. Even poor scholars were often seized, tortured, and the miserable sums they had won by begging torn from them by the brutal nobles. The knights, like Götz von Berlichingen, boasted that they were the wolves, and the rich traders the sheep upon whom they preyed. But terrible was the revenge which the citizens were accustomed to take

upon their despoilers. When their mounted train-bands issued forth from the gates of Nuremberg the tenants of every castle trembled and grew pale. The brave Nurembergers swept the country far and wide. They scaled the lofty crags, swarmed over the tottering walls, and burned or massacred the robbers in their dens. Noble birth was then of no avail; knightly prowess awoke no pity; the castle was made the smouldering grave of its owners. Yet the knights would soon again renew their strongholds, and once more revive this perpetual civil war. Every part of Germany was desolated by the ruthless strife.

Above the knights were the princes and electors, who preyed upon the people by taxes and heavy contributions. At the head of all stood the Emperor Maximilian, who seized upon whatever he could get by force or fraud. Yet the influence most fatal to the prosperity of Germany was that of the Italian Church. Rome ruled over Germany with a remorseless sway. Heresy was punished by the fierce Dominicans with torture and the stake. The Church, it is estimated, held nearly one-half of all the land, and would pay no taxes. Every church was an asylum in which murderers and malefactors found a safe refuge, and the church establishments in the rich cities were looked upon by the prosperous citizens as fatal to the public peace. They were dens of thieves and assassins. The characters of the German priests and monks, too, were often vile beyond description, and the classic satire of Erasmus and the skillful pencil of Holbein have portrayed only an outline of their crimes.

In such a land Luther must have felt that he could scarcely hope for safety. He must have foreseen, as he took his irrevocable step, that he exposed himself to the inquisition and the stake. He was at once encountered by a host of enemies. Tetzl declaimed against him in coarse invectives as a heretic worthy of death.¹ Priests and professors, the universities and the pulpit, united in his condemnation. He was already marked out by his enemies as the victim whose blood was to seal the supremacy of the Pope. Yet his wonderful intellect in this moment of danger began now to display its rare fertility. He wrote incessantly in defense of his opinions; his treatises spread over Germany; and very soon the reform tracts, multiplied by the printing-press, were sold and distributed in great numbers through all the fairs and cities of the land. The German intellect awoke with the controversy, and all true Germans began to look with admiration and sympathy upon the brave monk who had ventured to defy the power of the papal court. At Rome, meantime, nothing was less thought of than a schism in the Church. Leo was at the height of his prosperity. He had just dissolved the Lateran Council, which had yielded him a ready obedience; his cardinals were submissive; he was

¹ Ranke, Ref., i. p. 343. ² Id., i. p. 343. ³ Id., i. p. 223.

¹ Ranke, Ref., i. p. 347.

the most powerful and fortunate of Popes. From dull and priest-ridden Germany he looked for no trouble, and when he first heard of the controversy between Luther and the Dominicans he spoke of it as a wrangle of barbarous monks. The fierce storm that was gathering in the north was scarcely noticed amidst the gay banquets and tasteful revelries of Rome. But this could not continue long. It was soon seen by the papal courtiers that if Luther was permitted to write and live a large part of their revenues would be cut off; and Leo himself felt that if he allowed his dominion over purgatory to be called in question he must soon cease to adorn the Vatican or subsidize Lorenzo. If he lost his shadowy El Dorado where could he turn for money? The remedy was easy; he must silence or destroy the monk. He issued a summons (July, 1518) for Luther to appear at Rome within sixty days to answer for his heresies before his Inquisitor-General. Soon after, as he learned the extent of his danger, he sent orders to his legate in Germany to have the monk seized and brought to the Holy City.

If this arrogant decree had been executed there can be little doubt as to what must have been Luther's fate. He must have pined away in some Roman dungeon, have perished under torture, or have sunk, like the offending cardinals, beneath the slow effect of secret poison. The insignificant monk would have proved an easy victim to the experts of Rome. But, fortunately for the reformer, all Germany was now become his friend. In a few brief months he had become a hero. Never was there so sudden a rise to influence and renown. His name was already famous from the Baltic to the Alps; scholars and princes wrote to him words of encouragement; the common people followed him as their leader; and the great Elector of Saxony, the most potent of the German princes, was the open patron of the eloquent monk. Germany was resolved that its honest thinker should not be exposed to the evil arts of Rome; and Leo, obliged to employ milder expedients to enforce his authority, consented that his chief adversary should be permitted to defend his opinions before Cardinal Cajetan at Augsburg. It was Luther's first great victory.

Still, however, he was in imminent danger. If Germany was on his side, yet all the Italian Germans were more than ever eager for his destruction. The corrupt priests, the dissolute monks, the fierce Dominicans, the Pope, the Church, even the Emperor Maximilian, were arrayed against the true-hearted monk. He lived in the constant presence of death. Yet his spiritual agonies were no doubt to Luther more intolerable than any physical danger; for he was still only a searcher after truth. His nights and days were passed in an eager study of the Scriptures; he moved slowly onward through an infinite course of mental improvement; he was forced to snatch the jewels of faith from the dim caverns of superstition; he

groped his way, painfully toward the light. Yet so admirable was the disposition of this renowned reformer that through all his dangers he was always hopeful, often joyous and gay. Sickness, pain, mental or physical terrors could never deprive his gallant nature of its hidden stores of joy and peace. His clear voice often rose high in song or hymn; he was often the gay and cheerful companion, always the tender friend; his lute often sounded cheerfully in still nights at Wittenberg or Wartburg; and his love for poetry and letters soothed many an hour he was enabled to win from his weary labors. Compared with his persecutor, Leo, Luther's was by far the happier life. His joys were pure, his impulses noble, his conscience stainless; while Leo strove to find his joy in coarse buffoonery and guilty revels, in outward magnificence and idle glitter.

There now began a series of wonderful intellectual tournaments, the successors of the brutal encounters of chivalry and the Middle Ages, in which the true knight, Luther, beat down his pagan assailants with the iron mace of truth.¹ It had become the custom in Germany for scholars to dispute before splendid audiences abstruse questions of philosophy and learning; but the questions which Luther discussed were such as had never been ventured upon before. Was the Pope infallible? Could he save a guilty soul? Could not even councils err? Was not Huss a true martyr? Knights, princes, emperors, gathered round the pale, sad monk as he discussed these daring themes, heard with a strange awe his eloquent argument which they scarcely understood, and were still in doubt whether to accept him as a leader or to bind him to the stake. The first of these noted encounters occurred (1518) at Augsburg, where the graceful Cardinal Cajetan, fresh from the Attic atmosphere of Rome, came to subdue the barbarous German by force or fraud. Luther came to the hostile city full of fears of the subtlety of his polished opponent.² He felt that it was by no means incredible that the Cardinal was commissioned to seize him and carry him to a Roman prison; he knew that Maximilian, who was still Emperor of Germany, was not unwilling to gratify the Pope by his surrender. Yet so poor and humble was this object of the enmity of prelates and rulers that Luther was obliged to beg his way to Augsburg. Sick, faint, dressed in a borrowed cowl, his frame gaunt and thin, his wild eyes glittering with supernatural fire, the monk entered the city. The people crowded to see him pass; he was protected by a safe-conduct from Maximilian and the patronage of Elector Frederick; and he met the Cardinal boldly. Yet it was hardly an equal encounter; for Luther was sick, faint, poor, and in peril of his life, while Cajetan, in the glow of wealth and power, was the legate and representative of infallible Rome. At first, in sev-

¹ Walch, xxiv. p. 434. ² Ranke, Ref., i. p. 427.

eral interviews, the Cardinal consented to argue, but when Luther completely confused and overthrew him, the enraged combatant, with a false and meaning smile, commanded the monk to submit to the judgment of the Church. Luther soon after fled from Augsburg, conscious that he was no longer safe in the hands of his enemies. Leo, in November, issued his bull declaring his right to grant indulgences, and the monk replied, with bold menaces, by an appeal from the Pope to the decision of a council of the Church.

Maximilian died, and an interregnum followed, during which the Elector of Saxony became the ruler of Germany. Safe in his protection the monk continued to write, to preach, to advance in religious knowledge; and a wild excitement arose throughout the land. Melancthon joined Luther at Wittenberg, a young man of twenty, the best Greek scholar of his time, and the two friends pursued their studies and their war against the Pope together. But a second grand intellectual tournament soon summoned the knight-errant of religious liberty to buckle on his armor. It was at Leipsic, a city devoted to the Papacy, that Luther was to defend the Reformation.¹ His chief opponent was Eck or Eccius, a German priest, learned, eloquent, ambitious, corrupt, and eager to win the favor of his master at Rome. He had assailed the opinions of Carlstadt, one of Luther's associates at Wittenberg, and now the reformer was to appear in defense of his friend. The Leipsic university was bitterly hostile to Wittenberg and reform, and Eck rejoiced to have an opportunity to display his eloquence and learning in the midst of the most Catholic city of Germany. It was whispered that Eck was too fond of Bavarian beer, and that his morals were far from purity; yet he was welcomed by the students and professors of Leipsic with joy and proud congratulations as the invincible champion of the Church.

Soon the Wittenbergers appeared, riding in low, open wagons to the hostile city, in the pleasant month of June. Carlstadt came first, then Luther and Melancthon, then the young Duke of Pomerania, a student and rector of Wittenberg, and then a throng of other students, most of them on foot and armed with halberds, battle-axes, and spears, to defend themselves or their professors in case of attack; and it was noticed as a mark of unusual discourtesy that none of the Leipsic collegians or teachers came out to meet their literary rivals. Yet every necessary preparation had been made by the good-natured Duke George for the mental combat. A spacious hall in the castle, hung with tapestry and provided with two pulpits for the speakers and seats for a large audience, was arranged for the occasion; and the proceedings opened with a solemn mass. A noble and splendid audience filled the room.² The interest was intense; the champions, the most renowned theologians

in Germany; their subject, the origin and authority of the papal power at Rome.¹ Carlstadt commenced the argument, but in a few days he was completely discomfited by his practiced opponent. The Wittenbergers were covered with confusion. Eck's loud voice, tall, muscular figure, violent gestures, quick retort, and ready learning seemed to carry him over the field invincible. But on the 4th of July, a day memorable for another reform, the interest was redoubled as Martin Luther rose. He was of middle size, and so thin as to seem almost fleshless. His voice was weak compared to that of his opponent; his bearing mild and modest. But he was now in his thirty-sixth year; his intellect, worn by many toils and ceaseless labor, was in its full vigor; and his eager search after truth had given him a strength and novelty of thought that no intellect of the time could equal. He ascended the platform with joy, and it was noticed that the fond lover of nature carried a nosegay in his hand. Luther, at once neglecting all minor topics, assailed the authority of the Pope. With perfect self-command he ruled his audience at will, and princes and professors listened with awe and almost terror as they heard the daring novelty of his argument. From denying the authority of the Pope he advanced to the denial of the supremacy of a council; he unfolded with eloquent candor the long train of progressive thought through which his own mind had just passed; to the horror of all true Catholics, he suggested that Huss might have been a martyr. The audience was appalled; Duke George, startled, uttered a loud imprecation. The discomfited Eccius exclaimed, "Then, reverend father, you are to me as a heathen and a publican."

The Wittenbergers returned in safety and triumph to their college. But the corrupt nature of Eck, exasperated by Luther's bold defiance, led him to resolve on the destruction of his opponent. Nothing would satisfy him but that the brave monk should meet the fate of John Huss or Jerome of Prague. Eck, like Luther, was a German peasant's son;² his persistent malignity now decided the destiny of the Church. He hastened to Rome, and aroused the passions of Leo by his fierce declamations against Luther; the prudent pontiff seems to have been forced into extreme measures by the violence of the corrupt German; and Eck returned to Germany armed with a papal bull condemning Luther's writings to the flames,³ and commanding him to recant his heresies within sixty days or to be expelled from the Church. But Luther had already resolved to abandon the Church of Rome forever. He proclaimed his decision by a remarkable act. On the 10th of December, 1520, in the presence of an immense throng of students, magistrates, and persons of every rank, the bold monk cast into a blazing fire, without the walls of Witten-

berg, the Pope's bull and a copy of the papal decrees. From their smouldering ashes sprang up the Church of the Reformation.

Leo, enraged beyond endurance, now issued the bull of excommunication, the most terrible of the anathemas of the Church. Luther was declared accursed of God and man. There had been a time when such a sentence would have appalled the greatest monarch in Christendom; when the excommunicate had been looked upon by all men with horror and dread; when he was cut off from the society of his fellows, and was held as an outlaw deserving of instant death. But to Luther no such fatal consequences followed. His friends gathered around him more firmly than ever; men of intellect in every land acknowledged his greatness, and Germany rejoiced in the fame of its hero. Yet nothing is more remarkable in the history of this wonderful man than that he escaped death by poison or assassination; that in the midst of a land of anarchy and crime, surrounded by powerful enemies, cut off from the Church, accursed by the Pope, he should yet have been permitted to pursue unmolested his career of reform, to succeed in all his designs, to baffle all his foes, and finally to die in peace, surrounded by his loving family, in the very town where he was born. Another mighty foe had now suddenly started up as if to complete Luther's ruin. Charles V. had become Emperor of Germany. He was a young man of twenty, cold, grave, sickly, unscrupulous; he had been educated in the remorseless school of the Dominicans, and was the most devoted servant of the Church. To Charles Leo now appealed for aid against the arch-heretic, and the young monarch summoned Luther before him at the famous Diet of Worms."¹

Far and wide over Germany spread the news that the reformer had been cited to appear before the Emperor, and all men believed that the crisis of his fate was at hand. Every eye was turned upon the humble monk. The peasant's son was about to stand before princes, and every true German heart warmed with love and pity for him, who seemed certain to fall before his mighty foes. Luther's friends strove to prevent him from venturing within the hostile city. "You will be another Huss!" they exclaimed.² They suggested the subtle cruelty of the Italians and the implacable enmity of the priests. But Luther seemed urged on by an irresistible impulse to go to Worms and plead his cause before the Emperor, the princes, Europe, and all coming ages. "I would go," he cried, "though my enemies had raised a wall of fire between Eisenach and Worms reaching to the skies!" "I will be there," he said again, "though as many demons surround me as there are tiles on the roofs of the houses!" In his

rapt, half-inspired state he believed that Satan and his angels had encompassed him on every side, and that their chief object was to prevent his reaching the city. It is certain that all the evil passions, every corrupt desire, every immoral impulse of the age hung like raging demons over the path of the reformer.¹

Never was there a more memorable journey than that of Luther over the heart of Germany, from Wittenberg to Worms. It was Daniel going to the lion's den; it was a hero traveling to his doom; it was the successful champion of many an intellectual tournament couching his gallant lance against the citadel of his foes. It was spring, and the early leaves and flowers were clustering around the pleasant paths of Germany. Sturm, the Emperor's herald, appeared at Wittenberg, and said, "Master Luther, are you ready?" The monk assented cheerfully, and at once set out. He traveled in a very different way from that in which he had entered Augsburg two years before, begging his subsistence from town to town. Now he was the renowned champion of a new Germany; the harbinger of a brighter era. The herald, clothed in gay attire, rode before him. Luther followed in a low wagon or chariot, accompanied by several friends. By his side was the learned Doctor of Laws, Schurf, his legal adviser, and several theologians. As he passed the population of the cities came out to meet him; princes and nobles greeted him on every hand, and pressed money upon him to pay his extraordinary expenses; even hostile Leipsic offered him as a pledge of hospitality a draught of rare wine; at Weimar the good Duke forced gold upon him; at various places he was forced to preach before immense congregations. Yet in every city he saw posted in the public streets the bull condemning his writings to the flames. He paused a while at Erfurth, and wept as he revisited his little cell, with its solitary table and small garden, and remembered the wild July morning when the angry lightning-flash had won him from the world.² He passed through Eisenach, was taken very ill there, and had nearly died in the town where, a beggar-child, thirty years before, he sung his mournful melodies from door to door. He saw his relatives from Mansfield, his peasant family, and parted in tears from the well-known scenes. And thus, as if to prepare him for his doom, or to arm him for the fight, in this memorable journey, Luther's vivid mind must have pictured to itself a perfect outline of his by-gone life.

On the 16th of April Luther saw in the distance the towers of Worms. The fiery furnace lay before him.³ He firmly believed that he was going to his death, but his only fear was that his cause might perish with him. Tradition relates that, as he saw the city afar off, Luther rose up in his chariot and sang, in a res-

onant voice, a noble hymn which he had composed on the way, "God, our strong tower and defense, our help in every need." It is a poetical thought; it stirs the fancy as we narrate it. The venerable city of Worms was now thronged with all the great and powerful of Germany: the Emperor, the bishops, the papal legate, the princes, and a host of armed men, citizens, and priests. As the monk approached in his wagon he was met by a wild enthusiasm greater than ever princes or bishops had awakened. He was surrounded by throngs of people; the roofs of the houses were covered with eager spectators; his pale, worn countenance must have been brightened by a sentiment of gratitude and triumph as he felt that the people were his friends.¹ He was taken to the lodgings prepared for him by the careful Elector Frederick; but even there he could have found little repose from the constant throng of visitors of high rank who pressed in to see him and cheer him with encouraging words.

The next day toward evening the setting sun flashed his last rays through the great hall at Worms over an assemblage of the Emperor and princes of Germany. On a throne of state, clothed in regal robes, a collar of pearls around his neck, the insignia of the Golden Fleece glittering on his breast, sat the youthful and impassive Charles. Every eye in the splendid assembly had been turned with eager interest to his grave, young face, for to his narrow intellect was committed the decision of a cause that involved the destiny of ages. On his right sat a dignified array of the electoral bishops of the empire.² Each was a lesser pope, a spiritual and temporal lord, the firm opponent of heresy, the persecutor of the just. The bishops in gorgeous attire, their red and blue robes bordered with ermine, with all the imposing decorations of their order, assumed the highest places next to their imperial lord. On the left hand of the Emperor the temporal electors, mighty warriors, and imperious rulers had their seat. They, too, wore robes bordered with ermine, and glittered with diamonds and rubies; but the lustre of their almost regal power and ancient state was more imposing than any external pomp. Among them was seen the calm, firm countenance of Frederick, Elector of Saxony. On lower seats were gathered six hundred princes, lords, and prelates. There were fierce Dominicans from Spain, with dark, menacing eyes, the sworn extirpators of heresy.³ There were brave German knights, renowned for valiant or cruel deeds, seamed with the scars of battle. There were jurisconsults in black; monks with cowl and shaven heads;

abbots, orators, and priests. There a mighty throng of all whom Germany had been accustomed to fear and to obey awaited in stern expectation the approach of an excommunicated monk. But the spectacle without was far more imposing; it was a triumph of the mind. Every roof, tower, or convenient place was covered with people waiting to see Luther pass. A great multitude had gathered to devour with eager eyes the form and features of one whose humble brow and shaven head were made illustrious by the coronal of genius.

So dense was the throng that Luther was obliged to go through gardens and private ways in order to reach the Diet. As he entered the magnificent assembly he heard friendly voices on all sides bidding him God-speed. He pressed through the throng; he stood in the presence of the Emperor. Every eye was turned away from Charles and fixed upon the humble monk; he seemed confused by the scrutiny of the princely throng, and his voice, when the proceedings began, was faint and low. Little was done at the first meeting; Luther was required to admit that he was the author of the writings published under his name, and to recant his heresies. By the advice of his counsel, Schurf, he asked for time to reply to the demand. The assembly broke up, to meet again the next day; and the Emperor, deceived by Luther's modest bearing, said to his attendants: "That man will never make me a heretic." In his old age Charles V. was suspected of having adopted the opinions of the reformer whom in his youth he had despised. That evening Luther's room was again filled with princes and nobles, who came to press his hand and congratulate him upon his courageous bearing. He passed the night in prayer, and sometimes was heard playing upon a lute. But the next afternoon, about six o'clock, when torches had been lighted in the great hall and flashed upon the glittering jewels and stern countenances of the assembled diet, Luther arose, in the conscious pride of commanding eloquence and a just cause, to defend the Reformation. He was assailed and interrupted by the constant assaults of his opponents; he replied to every charge with vigor and acuteness; he spoke with a full flow of language, whether in German or Latin.¹ "Martin Luther," said the imperial counselor, "yesterday you acknowledged the authorship of these books. Do you now retract or disown them?" Luther fixed his inspired eyes upon the Emperor and the long array of dignitaries around him, and replied:² "Most serene Emperor, illustrious Princes, most clement Lords, I claim your benevolence. If in my reply I do not use the just ceremonial of a court, pardon me, for I am not familiar with its usages. I am but a poor monk, a child of the cell, and I have labored only for the glory of God." For two hours he spoke upon conscience and its privileges, of its superiority to the claims of Popes

² Id.

or councils, of the right of private judgment, of the supremacy of the Scriptures. The assembly listened with eager interest to his wonderful voice as it rose and fell in natural cadences, reflecting the varied novelty of his thoughts. The honest German princes heard with pride and joy an eloquence which they could scarcely understand. Erick of Brunswick sent him a tankard of wine through the press of the crowd.¹ "How well did our Doctor Luther speak to-day!" said the calm Elector Frederick, in a moment of unusual enthusiasm. But to the Emperor and his papal followers Luther had spoken in vain. They said the monk was imbecile; they did not know what he meant when he appealed to conscience and the right of private judgment. Meantime the torches were burning low in the great hall, and night gathered around the assembly. Luther's enemies pressed upon him with new violence; they commanded him to retract his heresies in the name of the Pope and the Church; they threatened him with the punishment of the heretic. Then the reformer, once more confronting the hostile Emperor, the persecuting bishops, the frowning Spaniards, and the papal priests, said, in a bold and resonant voice: "Unless, your Majesty, I am convinced by the plain words of the Scriptures I can retract nothing. God be my help. Here I take my stand."²

It was the voice of awakening reason; the bugle-note of modern reform. Never since the days of the martyrs and the apostles had that noble sound been heard. Never had the right of private judgment been so generously asserted; never had the apostolic doctrine of conscience been so distinctly proclaimed. Luther's bold words have since that time been ever on the lips of good, great men. Latimer and Cranmer repeated them in the midst of the flames. Hampden and Sydney followed in his path. The freemen of Holland and America caught the brave idea. The countless victims of the inquisition, the martyred foes of tyranny, the men who died for human liberty at Gettysburg, as well as the men who died at Bunker Hill, a Warren or a Lincoln, have said in their hearts as they resolved on their path of duty, "God be my help. Here I take my stand."

Luther left the assembly resolved never to enter it again. He was now in great danger of his life. The Spaniards had hissed him as he left the diet; he heard that the papal agents were urging the Emperor to violate his safe-conduct and try him for his heresy. Nor would Charles have hesitated a moment to destroy the reformer and gratify the Pope had he not been held in check by the menacing array of German princes and knights. They at least felt that it was Germany, not Luther, that had been on trial at the Diet of Worms. They declared that if the reformer were burned all the German

princes must be burned with him.¹ The knights and the peasants formed a secret league to defend Luther, and the Emperor and his courtiers trembled in the midst of the excited throng. He was suffered to leave the city unharmed. A sentence of condemnation, however, was forced through the assembly; he was placed under the ban of the empire, together with all his friends and adherents; his works ordered to be burned; and a severe censorship of the press was established to prevent the publication in future of any heretical writings. But Luther was now hidden in his Patmos, concealed from friends and foes.² As he was traveling cheerfully toward Wittenberg, defiant of both Emperor and Pope, in a thick wood near Eisenach, he was set upon by a band of armed men with visors down, who carried him away to the grim castle of Wartburg, where he remained in a friendly imprisonment until the danger was over. It was a prudent device of the sagacious Elector Frederick.

Once more, in December, 1521, Rome rejoiced over the death of a Pope; once more the Cardinal Camerlengo had risen from his bended knees to proclaim the certainty of the event. Again the great bell on the Capitol tolled heavily, and riot and disorder reigned in the sacred city. Leo was dead. An inscrutable mystery hangs over the last days of his life, and it is still in doubt whether the poisonous draught which his cardinals had prepared for him in the opening of his reign did not finally reach his lips. His people, impoverished by his excesses, exulted in his death. "Oh, Leo," they cried, "you came in like a fox; you ruled like a lion; you died like a dog!" Posterity has been more favorable to his memory, and men of intellect have ever looked with sympathy upon that graceful pontiff who was the friend of Erasmus and Raffaello, and who, if he had lived in a less corrupt atmosphere, might have yielded to the reforms of Luther. But the golden age of Leo X. is chiefly memorable as the period when the magnificent Church of the Middle Ages began swiftly to wane before the rising vigor of the Church of the Reformation.

THE TRAGEDIES OF A FEATHERED FAMILY.

THE other morning a cry of lamentation, loud and long, broke in upon the self-imposed quiet of my early hours, to my instant excitement and vexation—for I may as well confess that before breakfast, and occasionally after that mollifying meal, I am the least in the world cross, or, to use a word that sounds better, *nervous*.

This time, if I did not "do well" to be startled, there was at all events a justifying cause: "Oh, mamma! Dandy Jim is dead under the big cherry-tree!"

Alas! alas! that beautiful little Fuss-and-

¹ Andin, ii. p. 129. Ranke, Ref., i. p. 538.

² Ranke, Ref., i. p. 536.

¹ Ranke, Ref., i. p. 538.

² Walch, xv. p. 2327.

Feathers, so saucy on my window-sill the evening before, was brought in cold and stiff, the keen eyes closed, the pretty "double-rose" comb dull and drooping, the long, flashing plumes "sorrowfully trailed in the dust."

Dandy Jim—so called because the most finished coxcomb of the walk that ever strutted before admiring pullets—was a bantam rooster, after the Seabright persuasion. He was remarkably small, exquisitely feathered (black and gold and green, with a thousand *bizarre* pencilings), and so full of conceit, jaunty capers, and Beau Brummel airs, that from the first he took all our hearts by storm.

But the little fellow was doomed! If he ever had a serious moment he must have been conscious of an impending fate, handed down to him as an heir-loom. The taint of violent death lurked in his blood, and I doubt not lay at the root of every precious pin-feather that padded his plump body. And yet, for all, to think how dashing he carried it off!—how he crowed and capered, with emblazoned wings coquetishly drooped, and that bright banner of a tail, swaying the least bit to the left for very vanity! It is almost as provoking as sad to reflect that while our coarse denizens of the poultry-yard, devoted to spit or gridiron, live on, and, like the geese in the ballad,

"Accumulate much grease, eating corn, eating corn!"

this pet of the parterre, with nothing to do but to be merry and multiply his prettinesses, must needs fall or fly from his roost, and die of no one knows what—not so much as a ruffled feather to declare the mystery. Nothing indeed but, as I said before, the fatality in his family.

How many victims to this fell destroyer may have suffered in past generations I shrink from even surmising; my experience dates back only so far as Dandy Jim of Caroline's grandfather, known in his own social sphere as Billy.

This bantam cock, far less distinguished for personal brilliancy than his fascinating but somewhat degenerate grandson, was nevertheless no mean example of that fidelity, pluck, and gallantry for which his race is conspicuous among all the feathered peoples. He and his little white hen, Biddy—with her bright coral comb, ivory bill, and one tiny black feather on her left wing—were our original stock, a present from among the pet chickens of a farm.

This conjugal pair roamed the Eden of a flower-garden (under the rather sentimental tradition that bantams "do no harm") like another Adam and Eve, all constancy and connubial content. Billy industriously scratched and called his pretty mate at every fresh discovery of grub or grain, and Biddy as punctually rewarded his exertions by the evident relish with which she swallowed each pleasant morsel. But this interesting little drama of wedded bliss came to a sad and sudden termination one midsummer day. Biddy was going her solitary rounds in the accustomed haunts; no cheerful call saluted her willing ears, no skillful toes

scattered the mellow soil on every side that she "weel might fare." Such a state of things could not fail to rouse the alarmed attention of the family. For three days, in spite of search, conjecture, and inquiry, no trace of Billy. Then we learned his melancholy fate: in flying upon or over the well, he had fallen into its depths. Dead and dripping he was pulled up in the "moss-covered bucket," and laid away in the orchard where he had spent so many happy hours.

The little widow consoled herself by "stealing" a nest, cunningly hid between rose-bushes and a grape-vine that climbed a western wall. There she laid five delicate white eggs, scarce larger than a pigeon's, and in due course of time, which means just three weeks and a day, two small chicks crowned her patience and delighted her friends. One was pure white, the other black as any crow; wonderfully alert, quick-witted, and self-reliant, although such wee mites of chickies. The usual precautionary measures were taken: Mrs. Biddy, nervously clucking, every feather rustling with fussy importance, anxious, but too intelligent to be alarmed at our interference, was installed in a slatted box, with every convenience for the successful rearing of her young family. Fresh "salt hay," warm feed, pure water in abundance, and crisp, tender grass up to her very front-door. What more could hen-mother's heart desire?—unless, indeed, the free range of the garden, and that was allowed her after the first week of precarious chickenhood.

Now if it had not been for the Wise Man of our family we should never have known that the black chick was a rooster, and the white one a hen; and we were the more indebted to him because it promised us an exact reproduction of the first pair, for the black male bird undergoes several changes and additions of color to his sombre plumage, till he becomes often positively brilliant. This little couple were entering upon the satisfactions of their sixth week, perhaps, when the family fatality laid low their filial hopes. Whether the bereft Biddy, now that her maternal duties were almost ended, was re-attacked with passionate grief for her lost lord, or whether "railway accident" claimed her, in common with so many victims, does not appear; certain it is that for one mad moment she left her infants and walked out of the garden gate, out upon the iron track that stretched its cruel length miles and miles up and down. Here, with dejected deliberation, she strolled along, pecking, with the idle stupefaction of grief, at the bits of coal strewn between the "sleepers."

Suddenly a rush as of a whirlwind—a mighty roar and clatter—a whizzing, whirring flash—a piercing yell from the engine—the 1.30 express! Alas, poor little Biddy! A tiny handful of torn white feathers just outside the rail; and in a moment all is quiet, green, drowsy noonday as before.

A sad story to tell the little fellow, who from

his school windows has seen the train dash by, when he comes home in the boisterous glee of a country school-boy. I don't know whether you will appreciate that affectionate forethought in his mother which prompted her to forbid any blabbing of the news until he had voraciously enjoyed his dinner, pie and all; but reflect how severe the pangs of youthful sorrow, superadded to those of an empty stomach! The orphaned chicks peeped loud and shrill for several days after this calamity, standing around in chosen spots of lamentation on tip-toe, with necks outstretched; and then, beautiful to see! the little white "hen" took her black brother under her wing, so to speak, and played mother to him, scratching, picking, and calling him at every step. The Wise Man was duly apprised of this phenomenon. He took an early observation. "It was a pretty conceit of yours, my dear, that 'playing mother' fancy; but the fact is, plainly (strange I should have made such an absurd mistake!), that the white chick is the rooster, and the black one the hen. See, now, as they run together, how quickly the little hen responds to his call, and how dependent she is upon him!"

Our Wise Man's infallibility being in all respects equal to that of the "lady from Philadelphia," we unhesitatingly accepted the above oracle, and transferred our sympathies accordingly. Finding our consolation for the loss of their parents in the daily development of these young innocents and their mutual loves, we gradually became reconciled to their sudden change of sex, and to the even more awkward change of names.

To what lengths embittered discussion and divided opinion might have run in some heretical households, refusing allegiance to either Wise Man or Quaker City lady, it would be more painful than profitable to picture. If, after the Oracle had spoken, there *could* have been a doubt in any loyal mind, confirmation was near at hand.

On the —th day of the —th month, at exactly twenty minutes before twelve, the black and white chicks—being both in the middle of the path on this side of the grape-arbor, and consequently nearest the house—did, then and there, at one and the same instant of time, crow!—a cracked, creaking, spasmodic somersault of sound, doubly discordant as it issued from the two distended throats, but a genuine "crow" for all that. This mighty effort, involving a new revelation, came near upsetting *their* centres of gravity, and quite overturned ours. The Wise Man, who was at the moment attaining the solution to that domestic problem, "What becomes of the pins?" rushed out of doors in such hopeless hodge-podge of ideas that the world of husbands must forever remain the poorer, and "pin-money" remain an immutable institution!

As for the rest of us, we simply stared at each other for one brief second of vacuity, and then "brought down the house" with peals of laughter. "All our pretty chickens," "counted" after the manner of the silly milkmaid,

"Gone at one fell swoop!"

No such revolution in the feelings of the fraternal friends; in peace and harmony with all fowls and men, they continued with one accord to grow fat and feathery. Tails, long and gracefully curving, imparted elegance to every movement, and scarlet head-gear a dignity quite martial. The "White Biddy" was rechristened Tippy; although henceforth only a friend and brother, nothing could exceed his self-forgetful devotion; it was in vain you tempted him, alone, with yellow grains or Indian-meal stirabout—not a morsel would he touch till by impatient calling, and busy running to and fro, he had coaxed his shyer chum to the treat.

As Billy grew older his traits of character were in marked contrast with those of his simple-hearted, affectionate brother. While the one was the universal pet, as tame as the kittens and almost as accessible—taking his daily ride on the Wise Man's shoulder as he discussed his morning pipe under the grape-arbor, saucily pecking his mustaches, or even chasing him up and down like a playful pup, when wisdom stooped to folly—no endearments could familiarize the other; from his birth he was possessed with a wild, defiant *hauteur* that repelled every advance, and yet with enough audacity to forbid any imputation of fear.

It is painful to record of two such loving brothers that the day came which witnessed a bloody battle between them. But nature, like murder, will out; and in this case it came very near being murder. Tippy was rescued in the nick of time; dejected and wretched enough—his crowning "roses" bleeding, his beautiful, dazzling whiteness bedaubed and dragged. I bore him from the field of combat to my own chamber, bathed his wounds, refreshed him with sympathy and cold water, and left him to sorrowful, but I trust not altogether hopeless reflection—his little lead-colored toes wrapped around the back of a chair. Billy doubtless rejoiced in his victory, but with such measure of meek moderation as convinced us he was half ashamed of the whole affair. I think it was long before Tippy recovered from this shock to his profound fraternal sensibility; forgiven, I am sure it was, at once and freely. The outward signs of good-will were restored, but one could see a "difference;" besides, as cunning little mates had been procured for each, their paths in life were necessarily more and more divergent.

Another spring, and brother Billy was indeed still black, but exceeding comely. To increased elegance of person he united all the indomitable valor and pride of birth peculiar to the African bantam. No cock, were he twice a Shanghai, could for a moment intimidate this tiny embodiment of pluck; nay, the very watchdogs of the neighborhood, who at one mouthful could have crunched his strutting majesty, ran ignominiously before his fierce assaults. You will not be surprised to hear that his bravery was quite equaled by his devotion to the little

hens who followed close whithersoever he led by day, and nestled in a snug row on either side at night. Watchful, tender, and true, he was in all respects a model head of a family.

But again the hereditary fatality must step in—this time taking a more dread shape than heretofore. On a Sunday afternoon, peaceful and lovely as all Sunday afternoons ought to be, the Wise Man strolled out upon the lawn, and regaled the pet banties with some feed of which they were passionately fond. As they flew about his knees, scrambling and picking, Billy, in a sudden impulse of greediness, attacked his brother; but he was promptly “shooed” into apparent tranquillity; and the meal over, they were both playfully driven down the garden walk.

What was our astonishment to see them, the next moment run furiously at one another, clinching in deadly combat! Before we could speak the black bantam had dealt the fatal blow—his spur had cleft Tippy’s comb—our poor pet rolled over once, a slight spasm stirred all the snowy mass, and he was dead!

Lest you should too hastily condemn this fraternal homicide, let me tell you of a curious and pitiful circumstance: for days after the fatal result of his passion (as unexpected and distressing no doubt to him as it was to us), Billy would leave his hens and go to the very spot where Tippy died, and stand there, wistful, lonely, remorseful; or as if, missing his life-long companion, he instinctively looked for him where he had last seen him.

I am not sure there were not some tears shed over Tippy; but I *am* sure no one need have been ashamed of them.

Billy still lives, the terror of intruders; but since his brother’s departure somewhat of that gentle spirit seems to have fallen upon him—at least in regard to us; for he is now confiding and approachable. He has chosen a window-sill whereupon he holds gracious audience with the household, rapping smartly on the glass when his own imperious appetite and the wants of his family have not been duly attended to. This is his favorite feat of a winter’s morning—as he refuses, like common fowls, to wander abroad on an empty stomach; if the sash be indulgently raised he will not hesitate to enter, no, nor to invade the very breakfast-table, where his preference for butter, at its present high figure, has to be mildly but firmly put down.

A closing paragraph or two must introduce you to the pretty little hens, who, as befits their sex (or did befit it some years ago), have modestly remained in the back-ground.

There’s the white Biddy, the image of her ill-fated grandmother, even to the tiny black feather in the left wing; and the black Biddy, a little round ball of glossy darkness; the pale yellow hen, flecked with creamy tints, penciled here and there on the neck, tail, and wings with black; the old Speck, as distinguished from her daughter, young Speck, both perfect beauties, as to shape and plumage—especially

small, with heads like a partridge, and eyes keen as a flash—feathers all black, curiously spangled and bordered with pale gold, overlapping with exquisite effect; and lastly, the dark yellow hen, who has black feathers in her tail.

I wonder if it ever occurred to you that to chickens (as well as other purely domestic fowls) the peculiar privilege often belongs of having *two* of the very best gifts bestowed by the Heavenly Father; while a little boy or girl, “better than many” chickens, can never have but one. I confess I never thought of it till to-day. Do you give it up? Mother, of course: very many chickens have two, and I think it would puzzle even the Wise Man to decide which is the true mother of the chick—she who lays the egg, or she who hatches it.

Now darling little Dandy Jim was one of these doubly-blessed; he had two mothers; and if it had taken ten instead of two to bring him to such perfection, no one would have thought their pains thrown away.

Old Speck was his mother No. 1—there was no mistaking that exquisitely proportioned little egg, different from all the rest, white and polished as alabaster. White Biddy was mother No. 2, for she cuddled it under her white downiness, with six others, till it hatched, in a nest of raw cotton made in a basket, and kept in the kitchen for warmth. It was her first brood, early in the season called spring—but alas! for the snows and biting winds.

We had much to teach her, being a giddy young flirt, capriciously inclined for a week to give the whole thing up as a very unnecessary bore.

But the Wise Man put his mind to the case, and we succeeded in getting her to do the same—I need not add, if you know any thing of setting hens, that with *that* the battle was won; nothing less insignificant than an earthquake would have moved her. And the day she stepped out of that wadded basket with her seven little ones—black, yellow, and white—and walked straight into the breakfast-room to show them to us, could there have been a prettier sight?

The Wise Man said “No.”

LUCY'S CHOICE.

I.

ON a bright fair day in April, 1854, the bark *Polly*, 400 tons burden, lay at her wharf in Nantucket Harbor, preparing for sea. Huge piles of cordage, heaps of spars, harpoons, blubber-spades and knives, empty oil-barrels, barrels of water and of salt junk, boxes of hardware, and other stores, lay around or were being rapidly stowed aboard. There were supplies for years, as it seemed. And all would be needed, for the *Polly* was bound for the arctic seas, where, amidst snow and ice, she was to cruise for whales and trust to Providence for luck. All day long the toilers labored, as they had for many days before, but the task was

nearly done. And when, night descending upon the town, her Captain turned to go, leaving the greasy tub that held his fortunes to the careful watch, he rubbed his hands, and said to me that in three days more we should bid the old town good-by for many a long month.

Captain John Hoskins was an old friend of my father's, and many a trip had they taken together in former days; but my father's last voyage was over, and after growing gray amidst wild scenes of stormy seas and crashing icebergs he had laid him down peacefully at last, his perils ended, his rest that should have no end begun. I, Abner Skidmore, inherited the Captain's affection, and in my turn had become his shipmate. His home and my mother's—I was her only child—were almost close together, so close that the little patches belonging to each, and where grew the few light crops possible to be raised in that sterile region, nearly touched. It was not an actually lonely spot, but there were few neighbors, and my mother was glad enough that her sister and her sister's husband lived with her. They have nothing to do with the story, however. As was her household during my father's long absences and now mine, so was the Captain's. He was a widower, and he, too, had but one living child, a girl, Lucy, of whom I have much to tell. She is—well, she was then—just eighteen. I thought her an angel. Her aunt and guardian didn't, I suppose, for she called her cross names sometimes, which seemed to me absolutely wonderful. That pretty Lucy, with her blue eyes and rosy cheeks and golden hair and delicately rounded figure, could be other than the best as well as the loveliest of God's creatures appeared to me impossible. I knew that she was thus excellent. Well, for that matter, I think so still; for I was in love, as may be imagined, and am not cured of that complaint yet. Did she know it? How could I tell? Her father's laughing eyes would often rest upon us when we were together, and I fancied that he would not frown upon a match between us; nay, I felt so sure that he read my secret that I could at such times hardly meet his glance without a blush. You see, we were simple people, more used to old Neptune's ways than those of women, and I the simplest of them all. On that April evening, in fact, I thought rather bitterly that I had been an absolute fool. Here was I to leave her in three days, not to return perhaps for two and perhaps for more than two years, and had never yet found courage to speak plainly to my dear one or to her father. I dare say I showed something of this uneasy, mortified feeling as we came in sight of the two cottages, for the Captain turned half round and looked at me with a sort of inquiring wonder. Then and there I made up my mind.

"Captain Hoskins," said I, abruptly, "I want to speak to you."

"Why, speak away, lad. Something particular, I suppose, to be called speaking, and different from conversing, which we've been

doing more or less all day;" and he laughed heartily.

"Yes; something that I've thought of for years. If Lucy—"

"Ay! the wind's in that quarter, is it, my lad? Well, I've not been blind; however, heave ahead."

"What you say makes it easier for me, and I am very grateful. May I hope that if she likes me well enough you will not object to our marrying some day? There, Sir; it's all out, and I'm glad of it, for I have been miserable long enough, keeping my secret."

"Abner," replied the Captain, "so far as I am concerned, you have my good-will and best wishes. But how do you think she feels about it? You say if she likes you enough—you mean loves you enough, of course?"

"If I dared I would say that," I answered; "but I am not sure of it."

"You've never asked her?"

"Never. How could I without getting your permission?"

"Quite right, lad; young people ought to have some regard to the opinion of the old folks. Though, for that matter, when Lucy's mother, poor dear, and I had our first talk I doubt whether her father—but that's no matter; you have acted like the honest young friend I have always known you for. When will you speak to her? It's as well to sail with an easy mind, d'ye see."

"To-night," I replied, manfully. But though there was no uncertainty in my tone, I was not altogether easy as to the result. There was a neighboring family named Strong. Jacob, the eldest son, was, like ourselves, a whaler, and a fine, handsome, open-hearted fellow as any one could wish to see. He was a very frequent visitor, not only at the Captain's house, but at my mother's; and I knew that he admired Lucy, to say the least. He and I were friends, and he had told me as much. There might be a possibility that he was more favored than I; and certainly she seemed to be as well disposed toward one as the other, though I was sure of her father. Very likely he might fancy that the coast was clear, for, as I have said, I had not made my hopes very apparent even to Lucy, and not at all to him. What is it, stupidity, or shyness, or blindness, that keeps many men silent when a word would secure their happiness? How is a girl to judge between a silent lover and one that compliments and pays court to her? At all events, not another sun should rise before I knew my fate—not the best frame of mind in which to seek it, you will say.

It was not a very propitious circumstance that when the Captain and I reached his house Jacob was there; and it looked rather squally for Lucy to run out at one door of the parlor when we walked in at another. Jacob's face, too, was not so calm as usual. He was flushed, nervous, and showed, in fact, that something had happened. There passed round us three, like lightning, a sort of questions and answers,

like what in these later years I should call an electric telegraph of our inmost thoughts. The Captain seemed struck all of a heap.

"Well, Jacob," he said at last, "I didn't think to see you to-night; but you are welcome, as you always are. What's gone with Lucy? Have you frightened her away, or have we?"

"Neither, I hope," replied Jacob. "But I came over, Captain, to make an inquiry. She couldn't furnish the information, and so I'm glad you have come. You may be able to tell me what I want to know."

"Captain—Jacob," I interrupted, suddenly, "don't let me be in the way. I wasn't going to stay. I'll just step over to mother's, and be back in an hour or so." And, stupid-like, I was gone before the last word was well out of my mouth.

Of course I knew what was the matter. Jacob had been beforehand with me. I had lost my stake before I had staked it. There was no more use in striving further than in fishing for ropes and harpoons carried off by lost whales. And yet "the information" was not given to him either! What he had confessed to her I could guess, but it didn't look as if she had responded with any confidences of her own! It might be—yes, it might be, that I had a chance!

Two hours passed; they seemed like two years. Then I went back to the Captain's. I found him and Lucy and Jacob in the parlor together. "Abner," said the Captain, the moment I entered, "here's a worse coil than I looked for. It seems that Jacob here has been pretty much like yourself in regard to Lucy. Now I want fair play in this. I love you both, for good lads, and you don't need be told how dear Lucy is to me."

Of course we knew it, and could only murmur our belief. "Now," he continued, "Jacob has spoken to Lucy, and she's given him no answer. I've told her what you have said to me, and I can get no answer either. She likes you both, and that's the extent of it. Now what am I to do?"

What was he to do? Neither Jacob nor I could tell. The Captain was clearly vexed, and as for Lucy, she looked even in my love-dimmed eyes rather foolish. We were all silent.

"Well, then, let's put the matter into ship-shape at once," said her father. "Now you both love her, and can't both have her. That's number one. She don't want to lose you both, and would have taken either, if t'other hadn't come along. That's number two. Neither of you wants to give her up. That's number three. And when I add that she don't know her own mind, and ought to find out, that's number four, and all told."

"Nay, father," interposed Lucy, tearfully, "I only said that I wished for time to question my own heart. I am foolish and to blame, I know, but all this has come upon me suddenly, and I was not prepared for it. I am sure"—

and here her voice faltered—"they must both think me fickle, vain, and trifling. But I do not mean to be so. I hope they will forgive me, and—and—think of me no more." And she burst into a passion of tears, greatly to her father's and our distress and embarrassment. Jacob spoke first.

"Abner," said he, "you and I have been fast friends, and however this may turn out, I for one would have us remain so. Can you shake hands like a man upon that?"

"I can, with all my heart," I replied, instantly, suiting the action to the words.

"Then," he continued, with a quiet smile, "some of the difficulty is cleared away. Now listen, all three. I confidently hope that Lucy may accept me after a while, and so does Abner. Now he's off on a cruise, and I was not going to sail till next season, as you all know. I will not take the advantage this gives me. No man on earth shall say that I acted unfairly; and I offer, Captain Hoskins, to join your ship, to share your cruise with Abner; and when we both return we will once more ask Lucy the question she can not answer now. Are you agreed, Captain? Are you, Lucy?"

"Well," said the Captain, "I like you all the more for the offer, lad; and go with me you shall. Lucy need not have a word to say about it; in fact, I forbid her."

"But I have," said I. "I will not be less generous than Jacob; he shall not leave this port in my company."

"That," quietly answered the Captain, "is for me to decide. Abner, you've signed articles; so *your* business is settled. Jacob will sign, with me—you understand, with me; and if I choose to ship him aboard the *Polly* I don't know as you've got to be consulted. Nay, not another word. Give me my pipe and a jug of cider, Lucy. The whole subject's laid on the table, as our Congressman would say; and it is not to be lifted till the *Polly* sights Nantucket Harbor—maybe this time two years, maybe less, maybe more. You'll stay supper, lads, of course. Cheer up, my lass; your trouble's over for a time."

It was no use trying to open the discussion again. He would not even listen to a whisper from her, and we were fain to be content. Nor that night, nor next day, nor the next, did either of us recur to it.

And on the day after that—it was on Wednesday, the twelfth of April—a group of women stood on the wharf waving their handkerchiefs and watching with streaming eyes the bark *Polly* as she was working her way out to sea.

II.

Life on a whale-ship is not like life any where else. It is of grease, greasy. The *Polly* was an old tub whose every timber was soaked with oil—oil that had been stowed in every part of her except among the ropes and spars under decks or aloft, and would, as we hoped, be so

again. How many millions of cockroaches we carried Heaven knows; but they too swarmed every where—big fellows, too, that would eat a man's toe-nails off before he would wake out of a snooze. Rats, too—huge, ferocious-whiskered creatures, that would look at you as if they owned the ship; and fat—well they knew what barrels of oil were, and profited by the knowledge. And, what with grease, and cockroaches, and rats, and close quarters, the cabin and the forecabin weren't exactly like a lady's parlor, as may well be imagined. But the whaler combines sport with profit, and can put up with trifles. This is how the *Polly* was manned: There was the Captain, and three mates—myself the third. Jacob was entered as a supernumerary on shares, which made four. There were four boats, and consequently four boats' crews, of six men and a steerer each. A couple of negroes were cook and such, and two boys made up the lot—thirty-seven souls in all. Of these the officers and steerers were Americans, the rest a motley crowd of all nationalities, but all tolerably experienced hands.

There was nothing unusual to note for some weeks. We made about an average run, and got to Baffin's Bay in the second week in June. We had caught a glimpse of a spouter, hooked a blue shark, and seen icebergs in plenty, getting more and more numerous as we drew nearer the arctic seas, which were our cruising-ground. I may as well mention that, by common consent, we never spoke of Lucy, at least never of the events which had brought Jacob and I together. It was a point of honor with us, you see.

At length we were fairly within the region of snow and ice, and began to look in earnest for fish. We were lucky. In three weeks we had captured and cut up five whales and melted down the blubber. On Monday of the fourth week, at ten of the forenoon, another was sighted three miles away on the starboard bow. Not a moment was lost in manning and lowering the four boats. In less time than it takes to tell it we were pulling in a wide half-circle for the doomed monster. Jacob was harpooner in one, I steering in the same. I remember the scene as well as if 'twas yesterday. The wide waste of waters, still as a lake, with here and there the huge fantastic forms of icebergs, their lofty crags and pinnacles glittering in the arctic sunshine; the four boats gliding swiftly and noiselessly on, with a man in the bow of each with poised weapon, and part of the coiled line upon his arm, waiting for the moment to strike; and, growing in bulk as we drew nearer and nearer, the great mound of inert matter rising above the surface of the water. At last the word was given. From the first boat the harpoon flew swift and true, and buried itself to the socket in the fish's side. Then, as he felt it, with a plunge that sucked the water into a whirlpool, down he went, while the line ran out seventy yards, in a cloud of friction-born smoke, over

the gunwale, and dragging the boat along like a race-horse. A pause, then once more the monster rose to breathe, only to receive another mortal blow, and again to dive, leaving the waters crimson as he vanished out of sight. Now came all the excitement of the chase. Five harpoons had done their work, and their lines held fast. The last dive had hidden him for a while, and now he lay helpless upon the surface. More venturesome, as whalers are apt to be, from the excitement of the moment, all four boats approached near enough to hurl lances at the creature, and one even to strike at it with a boat-hook. But that piece of temerity was followed by what is always, or nearly so, looked for—the “flurry” of the whale. With a sound that resembled a huge bellow, and yet not that, nor yet the blowing off steam of a boiler, but something between the two, the whale suddenly rolled furiously, beating the waves with its broad tail until they were lashed into a sea of foam. “Back, back!” shouted the steersmen, and every man bent to the oars on the instant. Too late. Too late for one boat, at least. For, with a single blow, the whale dashed it into atoms, leaving every one of its crew struggling in the water. Two men sank like lead—never to rise again until land and sea shall give up their dead. One floated, stunned, for a moment, and then he too went down. Amidst a wild scene of wild shouts and throwing floats and rowing to and fro the rest were lifted out and saved, just as the whale slowly turned on its side until its white and slippery belly glittered in the sun.

“Hark! what is that? A gun from the ship!” shouted Jacob, as he suddenly turned to look at her. The dull boom had reverberated heavily along the water, and in the excitement few noticed it. We were at least five miles away from her.

“Something's wrong,” said I.

“Must be,” said he. “We'd best pull back at once.”

After a hasty word or two with the crews of the other two boats, ours, that is, the one in which were Jacob and myself, began to row back as quickly as we could, leaving the others with the whale. Three men were lost, but why abandon the prize? As I have said, we were five miles away. We rowed with a will, be sure, turning to look at the *Polly* as she lay motionless in the distance. And what did we presently see? A heavy cloud of smoke rise from her decks, rise thicker and thicker with every moment, until it hid masts and rigging from our sight, and lay all around her like a curtain, black as night.

The other crews had seen it too, and with a yell were making the water foam as they plied the stout ashen oars until they bent like willow wands. For our lives we strained—for ours? Nay, for those on board the *Polly*. God! that with all our efforts it must be so long before we could reach her!

Not a word spoke any of us. The horror upon us was too great. The ship, saturated as

she was with oil, must, we knew well, burn like gunpowder almost.

I at the helm watched her. Ah, how I watched her! Ere a mile was passed I saw the red flames mingle with the smoke, darting up now and then like fiery pillars. Speechless, with my heart standing still, I saw the fiery tongues running along spar and shroud and stay. I saw red gleams shoot out from her ports and flutter upward. I saw the flames grow fiercer and fiercer, until, with a rattle like musketry, they wrapped hull and all aloft in one embrace of fire from stem to stern. And then, God help us all! a dull roar told that the magazine was reached. Flying through smoke and flame, far and wide, and high into the air, went burning fragments; and in an instant after she reeled once or twice and went down. Nothing was left but a cloud of steam and smoke where but a short time before the *Polly* rode secure. And of those aboard of her not one was left. Like men distraught we rowed round and round where she had been, gazing for any poor soul that might rise in one last despairing struggle. In vain, in vain!

And we were all silent for a long time, some with clasped hands, and some with heads bowed in speechless horror. Only by slow degrees did we realize all that had happened, with its consequences. It was only as one and another found voice did we remember our own desolation. Desolation, did I say? There is no word strong enough to meet the case. Three boats with thirty men in them drifting in the arctic seas without provisions, scarcely any water, almost without hope. Not a sail in sight, nor perhaps ever to greet our anxious eyes. We must consult what had best be done, certainly that, but to what end? The nearest land was two hundred miles away. We had no compass nor chart. Surely some of us thought that the fate of our mates in the burned ship was scarcely less awful than our own.

Well, Jacob was the most practical man—he spoke first. Few words were needed as to the lost ship. Reverently and with many tears he offered up a prayer for the lost ones, in which all joined, though some were strangers to such utterance until now. Then he called for opinions upon the first question—were the boats to keep together? Some judged one way, some another. “Well, you have had your say; here’s mine,” he continued. “I am for separating. We may fall in with some vessel if together; but the chances are greater if each crew takes its own course; and if a sail does heave in sight, and it is saved, the other two may be looked for, perhaps.”

I need not describe the argument, but Jacob’s advice was taken; so first pulling back to the still visible whale, and cutting as much flesh as we each could stow aboard, we parted company, and soon three specks upon the water, far distant from each other, were all that was left of the *Polly* and her men that the glittering stars shone down upon.

Of course amidst all this horror there was one the thought of whom was agony to Jacob and me. With the first knowledge of his desperate strait we had looked at each other without uttering a word of him—we somehow could not. But now we might speak. No matter what our conversation was. I don’t like to say any thing more than that our agreement before sailing was forgotten as far as our hopes of our own were concerned. One resolve alone filled us, that we would be to her the friend and protector for life. Out of our great pity came this—but alas, alas! Only if we were spared. Whereaway now, was the business of us lonely castaways. Our fate was next to hopeless. As I before described, we had separated with a view of covering a wider track of observation in our efforts to steer southward. All three boats must be guided by the stars at night and the sun by day—that is, for the few, very few days life could hold out. And we began our part of the programme without much words about it. There were six of us besides Jacob and myself, and we pulled all that day and all the next night by turns. It is no use describing our sensations as they were at first. All through the darkness, which, as you know, is not darkness actually, we labored. When morning broke, what every one of us expected took place—not a sail to be seen, only the horrible icebergs, and packs ridged about with “buckles” like rugged lines of hills. Hunger and cold—raw blubber for the first, hard work for the last. And thus the next day and night, and the next.

Then what little water we had gave out. Hunger kills by exhaustion, but thirst drives men mad.

One of our men went mad the day after that, and, with a horrid shriek, plunged overboard. We tried to haul him in, but could not. The same night another died, quietly enough, for we found him as we thought asleep. Then, it might have been a day, or it may have been two days after, there was absolutely nothing left to eat or drink, and death seemed close upon us. What followed is like a dream. I have visions to this day of a gleaming knife and a rush of blood and a wild struggle to tear each other like wild beasts, and of Jacob lying insensible at my feet. And I, too, was soon like him.

Strangely enough, as it seemed to me, I revived, though not to full consciousness. It was as if I had awakened out of a dream. I did not realize my situation in the least, but sat drowsily looking at Jacob, and, if I thought at all, wondered he should be so still. And this continued for I know not how long. Unutterable content, as it were, had stolen over my whole being—that I *do* know. And so the end came.

The end, but not as I had expected. There rose up out of the horizon a sail! I looked at it without even curiosity. Tall masts crowded with canvas grew into sight, but I was past

thinking that here might be hope. The hull of a ship drew out of the offing, but if it were ship or iceberg, indifferent. The ship came over the waves toward me, look-out men aloft gazing, I knew, at my frail tub, but why they looked I did not even dream. They told me afterward that I laughed when they hailed me. Perhaps I did. I do not know.

So I was saved—I alone of all the *Polly's* crew. Oh God! Death had been busy with us poor creatures. When I came to myself, not until after many hours, I learned the fate of all. There was a story of a boat crushed to atoms by a "nip"—the meeting of two floes of ice—and one mangled body, and that was all. The other boat was never heard of more. Jacob lay at the bottom of the sea, as they told me, not without tears, for sailors are tender-hearted as they are brave.

All this has been stated very briefly, for I don't like to dwell upon it overmuch. I pass over, too, my slow recovery, and only pause to add, that if ever men were angels of kindness, the men who had saved me were. It happened that their ship was full—it was the second season of her cruise—and she was homeward bound for Nantucket. Her captain knew me, but him only on board. And in the middle of October we fetched the lights off the Shoals on the way home.

Home! I shuddered at the thought and the task before me. The fatal news that I brought—alas! would it kill the poor women who should hear it?

Well, we were signaled, and when we ran up to the wharf there was crowd enough to meet us, be sure. All my own folks among the rest. The Captain had heard all my story, and I had consulted with him as to how they were to hear it too. As agreed upon, I was helped ashore by him, and placed in my mother's arms, he telling her that I had come back sick—which I was, and very weak—and must get home at once. When Lucy, and her aunt, and Jacob's people pressed round us for news of their loved ones he hurried on board, saying that I would tell them all, and they had best go along with me. And so they did, in a procession of tenderness for me and of expectation. Arrived indoors, I was soon lying upon a lounge, the centre of a crowd of questioners.

"Friends," said my mother, "don't all talk at once. My boy's back, and I am thankful. Lucy Hoskins has the first right to make inquiries."

All of a tremble, she asked me, "You left father at sea with the *Polly*?"

"I did, with the *Polly*."

"And he was well, my dear father?"

"He was—well."

"Now my turn," interrupted Mrs. Strong.

"My Jacob, was he well too?"

"He was."

"Well, that's good tidings, Abner. Captain Hoskins and my son and all of them well and hearty. That's good—good. The Lord be praised!"

"Amen! amen!" returned many voices. But even while they sounded in my ears a new expression dawned upon Lucy's face—a sort of indefinable doubt or apprehension. "Are you sure, Abner," said she, almost in a whisper, "that they were indeed and in truth all well?"

"Indeed and in truth I believe that it is well with them all," I answered solemnly, and then bent my head in utter misery and anguish. And a great fear came upon them—a speechless, dreadful fear. "Abner Skidmore," screamed Mrs. Strong, immediately after, "you are not telling all; you are holding something back; in the name of God, what is it?"

But I could not answer, and there was no need. For from the wharf came such cries of agony and grief that with wild shrieks, as though with prophetic insight they knew what was the terrible cause, they all rushed forth to where the crew of my preservers were relating to a horror-stricken multitude of how the *Polly* had been burned in the arctic seas, and how all hands had perished save one.

I was spared the witnessing of what followed, for a dead faint came over me, and that was succeeded by delirium. For many days I lay tossing to and fro in burning fever. When reason again dawned, the intensity of my poor friends' grief had calmed somewhat, and they could hear from me the terrible story. Ah, how Lucy wept when I told it! and truly I wept with her.

Of course there could be no allusions to our bargain, for a long time, if ever. The Captain's circumstances were good, and his daughter and her aunt were provided for. Henceforth they must be two lonely, mourning women, upon whom my hopes could not be intruded without offense, even cruelty. Without a hint or a murmur, therefore, I assumed the position of friend and brother, and was so, tacitly, accepted. And a year passed away. Then came up thoughts of going to sea again, and I casually, as it were, mentioned the subject to Lucy's aunt. It was one evening when she sat with me on the porch, Lucy being inside the house. To my surprise, rather, the aunt strongly opposed my project.

"Why can not you settle your home at once, right here?" said she.

"Because a home without a wife is none; and a wife I shall never have," I replied.

"I don't see why. See here, Abner, I have never spoken of it before, but you may as well know that I am aware of all that took place before you sailed on that terrible voyage," she answered.

"And how can I revive the subject now?" said I. "It would be the height of cruelty to mention Jacob's name to Lucy, the name of him who perhaps she mourns as her dead lover. No, I will not be so inconsiderate. I have no sign from Lucy either. Let it all go by. I shall never marry."

"Do you love her, Abner, still?" questioned she, with a peculiar smile.

"As I do my life!" was my fervent reply.

Wonderful to relate, a little hand was placed on mine as a form, that I did not know was so near, came to my side. And suddenly aunt vanished. "I loved you, Abner dear, all the while, but did not know how much until it was too late to call you back." And with a few tears, partly of sad recollection, and partly of joy, she laid her head upon my breast.

There is little more to be told. We were married. We live in the same house with my mother, and Lucy's, now my, aunt. We are very happy, although at times Lucy's tears will flow silently as she thinks of her dead father, and of the young man who went to his death because she did not know her mind.

DIANA POLVILLE'S PRISONER.

ABOUT the time that the *Mayflower* left the shores of England there was, as every body knows, a sort of centrifugal force at work generally in the old country which began to send the worshipers of unfavored sects hither and thither to find a better home than their own land promised to afford them. It was not very long after the Pilgrim Fathers of fame made their way across the Atlantic that another shipload of Pilgrim Fathers, to whose names fame has been less liberal, set out likewise on a westward voyage, but got no farther than the south coast of Ireland. There they landed, and pushing a little inward, founded an Anglo-Protestant colony, which retains some of its peculiar and distinctive features up to the present day. The traveler of a few generations ago, journeying through the south of Ireland, was a good deal surprised (supposing he had brains enough to observe any thing and not knowledge enough to be previously acquainted with the condition of things) when he found that he suddenly plunged from a population of Macs and O's into a population of Pols, Tres, and Pens—from Celtic and romantic O'Connors and O'Donoghues into prosaic Browns and ordinary British Robinsons. For the little English Protestant colony walled itself up exclusively into a town of its own, and enjoyed itself in true British fashion by keeping a solemn and rigid retirement in the bosom of its own set and sect. In the early days of this little settlement nobody's notions of religious liberty had advanced much beyond the idea of liberty for himself to practice his own religion to the restriction of every body else. Liberty then had not presented itself to the ordinary mind as something capable of being supplied to all people without limit or expense, which every body could enjoy to the full for himself without restricting or begrudging his neighbor's enjoyment. It seemed rather like some precious thing of very limited supply which you must either clutch and hold for yourself or let your neighbor carry it off to your utter privation. It is not therefore surprising that the Anglo-Protestant colony in the south of Ireland, having come there for the sake of religious liberty,

should distinguish itself by a narrow illiberalism and bigotry which even in that day were regarded as remarkable. Dropped down in a strange and hostile country (passively hostile at least), these Anglo-Protestants could not persecute; they could only exclude. This they did very rigidly so long as they could; and their exclusion was not merely applied to the heterodox in religion, it also applied to the ungenteel in business. Old residents who were alive but the other day could tell with a mournful pride of the bright years when the walls of the town (it really had walls) inclosed neither a Papist nor a trader. Degenerate days, however, began to grow upon the colony. Service was no inheritance then any more than now; and the John Thomases and Mary Janes who had come from Middlesex and Surrey and sweet Devonshire and wave-washed Cornwall had a way of taking up with the Papist Irishry outside the walls, and vanishing thereupon into the extramural spheres of existence. For many and many a year had English law striven by cruel and hideous penalties to keep the British soldier from laying down his arms when summoned to surrender by the dark eyes of some Papistical Irish girl; and the penalties were even more vain than they were abominable. It sounds strangely now, but it is none the less certain, that there were whole broods of families, born of English fathers, who could not speak one word of the language of Milton; and at one time there seemed good reason to fear that the English tongue would cease to be spoken any where in the land. Of course, about the time this colony I speak of had begun to thrive, this struggle of race was over, and it was clear that the tongue of the Anglo-Saxon, though not his religion, was to prevail in Ireland. But do what the lordly, ruling race might, there was no preventing the love-making and the intermarriage of English and Irish. The same strength of affinity or destiny, or whatever it was, which enabled the great Hugh O'Neil, the renowned rebel Tyrone himself, to win for his wife the sister of the very commander sent over by the English Government to crush him (and whom he crushed despite the bond of marriage that made them brothers-in-law), that same power exerted itself in humbler ways among the Protestant colonists of the south to deprive the town of many of its natural and legitimate inmates. New servants and followers, new butlers and grooms and cooks and Abigails, had to be sought somewhere, and they could only be taken from the native and idolatrous population outside. Gradually, therefore, it came to pass—the Anglo-Protestants steadily dwindling and the Irish Papists increasing—that all the laborious and menial work of the town was done by Irish hands. So the colony became divided into two distinct classes—almost as distinct as the masters and the slaves of Old Virginia. Trevanion or Baldwin, or even Johnson or Brown, was master or mistress;

O'Brien or MacMurrough was servant. The former was Protestant, the latter Catholic—*celu s'entend*. But then outside the walls you had the native race, numerous and clan-nish and proud; and with them O'Sullivan or O'Donoghue was a name of dignified and lordly association. The name which to regular residents within the walls, wrapped up as most settlers are in their own ways and ideas, suggested only poverty, menial service, and utter inferiority, spoke to the population outside the walls of a chief and a tribe, and a grand, mournful history. Mention the name of O'Neil to one of the colonists and he would only think of his saddler or his gardener, while the saddler or the gardener despised his master in his heart as a vulgar Sassenach upstart, and was proud of bearing the family appellation of the great Hugh who demeaned himself by consenting to become Earl of Tyrone. Send an Irish servant with a message to some one named Brown or Jones, and he would go to the place and ask simply for Mr. Brown or Mr. Jones. But if he had to make inquiry for a M'Carthy or an O'Rourke, he would always ask if "one of the M'Carthys" or "a boy of the O'Rourkes" was there. That is to say, not an obscure, isolated amounting-to-nothing individual named M'Carthy or O'Rourke, but a recognized member of the great and noble tribe and family of M'Carthy or O'Rourke, sharing in all the dignity and entitled to all the support of the whole connection.

It would be superfluous to say that during the troublous times which followed the outbreak of the French Revolution the sympathies of our colonists went wholly and ardently with the cause of Law and Order, the Crown and the Throne. Nowhere was "Boney" more detested than in this loyal town; and after Napoleon the man most abhorred was probably Charles James Fox. When the Irish Rebellion broke out, with the unsuccessful attempts of the French in Bantry Bay and Killala, a great many loyal persons in the town were honestly of opinion (as a great many loyal persons in London were likewise) that Fox was one of the principal instigators of the wicked Irish, and that the good King George the Third ought to have had him executed out of hand. To increase the fervor of loyalty the town was filled with soldiers, and the officers were billeted among the principal families, who received their red-coated guests with delight. The ladies of the town, especially the unmarried ones, loved the military quite as much as the Grand Duchesse did; and some of them would have been well content that civil war should be prolonged forever, if it secured to them the delightful society of the handsome young officers at ball and rout, for walks and rides. On the other hand, it is perhaps almost unnecessary to say that if Miss Trevelyan and Mrs. Polville delighted in "the officers" and detested the rebels, Bridget O'Hanlon and Nelly Maguire, the serving-women, took a different view of the situa-

tion, and in their secret hearts detested the officers and delighted in the rebels.

Mrs. Polville had special and extra reasons for loyalty and for hatred of rebellion, as well as those reasons which were common to all her sex. She was the widow of Colonel Polville, who had borne arms honorably in the service of his gracious Majesty, and had been with General Wolfe at Quebec. A lady, therefore, who was actually receiving for herself and her two daughters his Majesty's pension, was engaged by every principle of duty, honor, morality, virtue, and religion to abhor rebellion, especially when that rebellion, iniquitous in itself, was made yet more guilty by the odious favor of France. Moreover, her eldest daughter, Ada Polville, had been for some time engaged to the gallant young cavalry officer, Captain Edwardes, now quartered in the town. Now Captain Edwardes was a very eligible personage. He was tall, he was handsome, he was of good English family, he had a considerable fortune of his own; and he seemed to be much in love with the tall, handsome, showy Ada, whose flashing white teeth alone ought to have bitten into any susceptible bosom, to say nothing of the brilliancy of her eyes, the captivation of her curls, the symmetry of her ankles—and at that stage of fashion ankles counted for a good deal in a girl's *tout ensemble*, for the dresses recognized the existence of lower limbs, and were made to display them. Diana Polville, the younger sister, had not yet, apparently, succeeded in captivating any one in particular, although she was the favorite of every one, and had harmlessly flirted with whole battalions of his Majesty's officers, and even with various of his Majesty's Hessian allies, of whose language she could not speak three words. Girls in England, Ireland, and America had not got into the way of reading Schiller and doting on Heine then. Indeed, one reason for their not doting on Heine may have been that Heine then was not born.

It would be hard for us here thoroughly to understand how dear and precious to the womankind of the town I am describing were the friendly attentions and services of "the officers." The whole south of Ireland was under martial law. You could hardly cross your own threshold without military authority; you had to give the countersign half a dozen times before you got from the pump in the square to the finger-post outside the walls. When night set in the military precautions and restrictions were of course doubled—quadrupled. If Diana Polville wanted to send her maid across the street with a message to the friend of her bosom, the lass had to trip it under the protection of a military guard. Unauthorized persons wandering about at night were liable to be arrested, and indeed dealt with exactly as it might happen to suit the humor of the nearest officer in command. Bayonets glittered at every street corner; muskets clanked on every paving-stone. In the midst of all this the little

town beamed and sparkled with revelry. Balls and parties were given every night every where—it was, who should do most to manifest loyal devotion to the martial representatives of British authority. One can have little idea now how delightful all this was to the girls of the place; how exquisite was the pleasure of being escorted to and from a ball by a handsome military guardian through files of saluting soldiers, who would have instantly arrested any body less favored and marched him or her off to Heaven knows what vileness of durance. Then the delicious and perpetual excitements of pass-words and countersigns, of marchings in and marchings out of sentinels and troopers encountered every where, of fearful stories about new landings of the French and new musterings of the rebels; and in the midst of all this to have the sublime protection and the brilliant society of the young heroes in scarlet jackets who were the gods of the situation, controlling and lord-ing over every thing, and who never seemed one bit afraid or in doubt about the satisfactory conclusion of the whole business.

Yes, Ada Polville was indeed a girl to be envied. She was actually engaged to the handsomest and richest officer in the garrison—an officer who was often, too, in important command. But Diana, the younger and smaller sister, although not engaged to any body, was likewise to be envied, for as Ada's sister she had strong claim to Captain Edwardes's attentions; and there was not a subaltern in the garrison who would not have been proud to devote himself, body and soul, to the carrying of her fan in safety from one end of the town to the other.

Ada Polville and her sister were riding out one day with Ada's lover. The lover of course kept close to Ada's saddle. A couple of miles from the town there lay, on the left of the road, a deep valley, and out of the valley, far away, rose sheer and sharp a hill which was crested by a heap of ruins. There was a keep or square central tower, quite in ruins; there was a more modern building, partly unroofed and looking more dreary than the keep, because it seemed like a house which modern people might have lived in and yet was miserably dilapidated; and there were some mouldering walls and broken towers. The whole mass stood out now against the violet evening sky, and was picturesque, striking, and sad.

"What a dreadful old tumble-down place!" said Captain Edwardes.

"Did you never notice it before?" asked Ada, surprised at the kind of curiosity with which her lover seemed to regard a ruin so very familiar to her.

"Don't know that I ever did."

"And you have been living here ever so long, and must have passed it ever so often!"

"Dare say. But I didn't notice it, somehow. It's the sky to-night, or the sunset, or something, that shows it off so clearly. What is it? Nobody lives there, surely?"

"Oh no; nobody lives there. It's O'Dwyer's Castle."

"Yes? Who's O'Dwyer?"

"Oh, well—O'Dwyer; *the* O'Dwyer, you know."

"Dear child, I haven't the least notion. Who is the O'Dwyer? and why doesn't he have his castle repaired? It's a capital site, you know. He might make a very nice place of it. But it would mop up an awful lot of money to put it to rights."

"Dear stupid Fred! The O'Dwyer hasn't any money; and it's gone to rack and ruin, and he's out of the country this ever so long."

"Cut and run from the creditors, I suppose. Poor old boy! Perhaps it comes hard upon him to live far away."

"But, Fred," broke in Diana, "he isn't old. He's young; and very handsome, I have been told. He was dreadfully poor, and the castle all went to ruins, and he couldn't do any thing; and he went abroad, and is in the French or the Austrian army. One of our servants has often told me all about him; she says she is a twenty-fifth cousin of his, or something of the kind; and I think mamma knew him when he was a boy. Mamma can tell you all about him; but she shakes her head sadly over him."

"Thank you, Di; but I don't think I much care to hear any more about Mr. O'Dwyer."

Both the sisters broke into a pretty, merry laugh.

"Now then, girls, what's the fun?" asked the good-humored soldier.

"Oh, Fred, you know," said Diana, "he isn't *Mr.* O'Dwyer."

"Isn't he? Surely he isn't Mrs. O'Dwyer?"

"Nonsense."

"Well, I don't know his present rank. *M. le Capitaine, or der hoch-und-wohl-geborne Herr Hauptmann*—any thing you like."

"Oh, I don't mean that! But it would be a dreadful offense to call him Mr. O'Dwyer. I only wish my maid Nelly heard you! He is *The* O'Dwyer—the one O'Dwyer, the Chief O'Dwyer. To call him Mr. O'Dwyer is far worse than it would be to call you Corporal Edwardes."

"Then I beg *The* O'Dwyer's pardon, and I am sorry for offending him—especially as he is hard up, poor fellow."

So the O'Dwyer dropped out of the conversation for the time, and was forgotten. Captain Edwardes did not apply to Mrs. Polville for information on the subject: it was easier to start Mrs. Polville with a theme than to stop her, once started.

Mrs. Polville gave a ball a night or two after this conversation, and every body worth having was there. Mrs. Polville was herself the author of a proposition having for its object the limiting of invitations to such balls by the adoption of a rule that nobody should be asked who had what she called any visible means of subsistence. But the rule did not work, inasmuch as it excluded the banker of the town, whom three-fourths of the gentlemen had the best

possible reasons for desiring to conciliate; and it admitted a wandering swindler from Dublin, who made love to several marriageable girls, very nearly succeeded in carrying off one of them, and actually did succeed in carrying off a silver tea-pot and three gold chains. But although Mrs. Polville's proposition did not work, it still demonstrated what a great genteel soul the woman had, and the mere conception entitles her to our respect and sympathy. To do her justice, she always endeavored, to the utmost of her ability, to realize the bright ideal she had set up; and the great majority of the guests at her ball did, in fact, consist of persons whose incomes were of what she regarded as invisible origin, that is, were not derived from trade, or commerce, or salaries, or other such ignoble obvious sources.

Captain Edwardes was in the third figure of the first quadrille with Ada Polville, when a message from the barracks was brought to him. Some prisoners of unusual importance had been taken, and he was the officer highest in command who could then be got at. The barracks were only just across the way, so to speak; and Captain Edwardes, having finished the quadrille and grumbled at the harsh duties of warlike times, hastened away with a promise to return immediately. He came back very soon, and told his *fiancée* that the prisoners were, in one sense, persons of some importance: they were four French officers, waifs of Hoche's luckless expedition, who had been endeavoring to make their way back to the sea-coast, and had fallen in with some cavalry, and so got taken.

"Poor fellows!" said Ada; "must they be shot?"

"Not likely," replied her lover, with a broad smile on his manly countenance. "Only prisoners of war, Ada. We keep them until they can be exchanged, that's all; there will be opportunity enough, I dare say. Meanwhile we must treat them as gentlemen—which they seem to be in every way, and deuced nice fellows too. The worst of it is, one doesn't know what to do with them. Isn't much amusement to be had at our confounded old barracks yonder—and then hardly any of our fellows can talk to them. I can get on pretty well when they go slowly; but, hang it all, when they get to talking their Parisian jabber too fast, I can't keep up with them."

A bright idea struck Ada. As they were not in chains (which she at first supposed they would be), and as they were not to be shot like dogs or Croppies, why not bring them here—over here, to the ball? Frenchmen all danced and were delightful; and then Diana and she could speak French like any thing. To be sure they were enemies—

Captain Edwardes laughed at the notion of carrying enmity into one's relations with a gallant and gentlemanlike prisoner of war; and he quite caught at the idea of bringing his captives straight away into pleasant society. Mrs. Polville assented cheerfully, thinking the presence

of four French officers, just made prisoners of war, would be a striking and splendid feature of the ball. In brief, the prisoners were invited, and came, under the special escort of a subaltern officer and a guard.

The prisoners were four—two elderly, grizzled and gray; two young. Of the two young, one was short and boyish-looking; the other tall and stately, with a fine drooping mustache, then rather an unusual ornament, at least in society of the south of Ireland. They were all gentlemanly and agreeable; they all danced; one of them played the guitar delightfully; another sang such exquisite, airy little French ballads (people sang in society in those days), and they soon became highly popular among the company. To be sure the attentions of some of the ladies were limited to smiles and the word "*oui*;" while some of the gentlemen could do nothing more to demonstrate their hospitable wishes than slap the captives on the back and point to the supper-table and Champagne bottles. But the Frenchmen (none of whom seemed to know a word of English) took these attentions as genially as they were meant, and responded with demonstrations of equal cordiality. Three of them became soon as joyous as if they were really at home. The fourth—the tall young man with the drooping mustache—was less cheerful than his fellows. He did not sing; he did not play; he danced but little; he drank but little. His captivity, soft and silken though it was now, seemed to weigh heavily on him.

Now Diana, having done her very best—and it was a great deal—to make all the four happy, was especially taken by this one. His face, his dark melancholy eyes, his form, his expression, the bright beaming smile which sometimes lighted up his features in acknowledgment of her efforts to please; his conversation, which was full of feeling and variety; his evident enjoyment of her society—all this attracted and impressed her immensely.

She made him dance with her, and told him he must sit by her side at supper. In those days the supper was an event toward the happy bringing about of which it behooved the ladies of the family, at least in a small country town, to give some personal attention. Diana knew that her mother, as hostess, would have to remain in the room with her guests, and she would not have her sister Ada withdrawn, even for a moment, from the society of her lover. So she stole away to the supper-room to see how things were looking.

On her way thither she was encountered by her maid, Nelly, who came up to her with looks of profoundest mystery and alarm, and laying a plump finger on red lips in token of awful secrecy, drew her young mistress into the shadow of a window-curtain.

"Holy Virgin, Miss! do you know who that is you've been dancin' with there?"

"That French officer, Nelly? I don't know his name—"

"Arrah no, Miss! Sorra'a Frenchman is he, God protect him! It's the O'Dwyer himself!"

"Nonsense, Nelly; it can't be."

"It is, Miss Di—it's himself! Sure I ought to know, and I knew him the first moment I saw him. Oh, the Lord defend us!"

"Well, Nelly, what matter even if it is the O'Dwyer?"

"Why, Miss, he'll be shot or hanged!"

"No, you silly girl. Captain Edwardes told Miss Ada they never shoot prisoners now. They will all be exchanged."

"Ah, yes, Miss Di, the French prisoners will. But sure the O'Dwyer, he's a rebel, you know, not a Frenchman. Small chance of his life if once they find him out! Oh, I'd give my life to save him if I could."

"Had I better speak to some one—to Captain Edwardes?"

"Oh, Miss Di, don't say a word to any one, for your life. Sure it would be the Captain's duty to send the O'Dwyer to be tried as a rebel—"

"Why, Nelly, you seem to know all about it."

"God bless us, Miss Di! one can't help knowing all about it these times, what between the boys that are 'out' (i. e., in rebellion) and the soldiers one hears talking it all over. No, Miss Di—not a word about the O'Dwyer to the Captain or herself" (the mistress of the house, herself *par excellence*), "or even Miss Ada; but I wonder, Miss, if you and I between us couldn't manage to give the O'Dwyer a hint and get him off some way?"

Diana thought she certainly would like to try. The idea of that handsome, graceful, gentlemanly creature with whom she had talked and danced being liable to the death of a felon or a dog struck her as unspeakably hideous, and her soul was all on fire to prevent such a horror. The first thing was to find out whether the O'Dwyer, supposing it were really he, stood in so much danger as Nelly supposed. A quiet question or two, put as if out of mere curiosity to Captain Edwardes, soon made that clear. A French officer was an enemy, not a rebel; for a rebel, even though wearing a French uniform and bearing a French commission, a capital trial was inevitable. Any British born subject taken in the ranks of the French invaders was simply a rebel. Some of my readers may remember that Wolfe Tone wore the French uniform, and was captured along with several French officers, and that his comrades endeavored to conceal his nationality, and so, too, did some even among the loyal officials who suspected who he was; but a careless or ill-natured person who recognized him openly called him by his name, and Tone, scorning further subterfuge, acknowledged himself, and so was sent off to the prison, where his own hand anticipated the doom of death pronounced upon him.

Diana then sought out again the object of her interest and leaned upon his arm. She complained of the heat, and made him con-

duct her through room after room until they came into one which was deserted. Up to this time they had been speaking in French, and she had not intimated in any way her knowledge of his identity.

The moment they were alone she began, in English:

"Oh, Sir, why are you here? I am speaking to the O'Dwyer, am I not?"

Her companion started. But he came of a proud old stock, whom danger was not supposed to startle out of composure. He smiled, and calmly replied:

"Yes, Miss Polville, I am the O'Dwyer. I did not, I confess, expect to be recognized by you. But I am in my right place, at once as a French officer and an Irish rebel."

"You know your danger? You know that you are not like the others?"

"Surely. I am a rebel against your gracious sovereign, and if I am recognized I shall be sent to death. I knew the risk, Miss Polville, before I made the venture, and I am prepared to pay the penalty."

"You sha'n't pay the penalty! You shall be saved!"

He looked down with a smile of admiration at the enthusiastic girl, who looked up into his face with sparkling eyes and flushing cheeks. Then he shook his head.

"I don't mean to proclaim myself, Miss Polville. I am not Quixotic enough for that. I appear here as a French officer, and a French officer I am. But I say, frankly, I don't think it would be possible for me to remain many days in this part of the country without being recognized."

"You sha'n't remain! You shall escape this very night!"

"Impossible. Miss Polville, I can not tell you how deeply I feel your generous interest; but the thing is impossible."

"Not a bit of it! Listen to me—and there is no time to be lost. Give me your arm again. Come boldly out into the shrubbery with me—to look at the stars. Mamma will warn me against cold, and you shall take one of the cloaks of the soldiers in the hall, as if to wrap round me. I'll bring you to the stables; you shall mount the best horse there. I know the pass-word, and countersign, and all the rest of it. You shall ride to the coast; any cottage there will shelter you until you can find a fisherman willing to put to sea and land you on the shore of France. The first fisherman you meet will do it with delight when you tell him you are the O'Dwyer escaping from Sassenach law. Come—don't waste a word—come, come!"

She was actually dragging him on.

"Miss Polville, I shall never forget your generous kindness. But it is useless. I am here on parole. My word of honor was given to Captain Edwardes that I would not attempt to escape."

"That was as a French officer."

"And I am a French officer."

"Yes, but you did not give your parole as the O'Dwyer."

"No; and if the O'Dwyer could escape without taking the French officer along with him it would be all right. But I don't quite see how that can be done. No, Miss Polville, neither the O'Dwyer nor the French officer can break his word of honor, or palter with it in any way."

"Hush! here is some one coming."

The O'Dwyer became a French officer, unskilled in English again.

The difficulty about the parole had not occurred to poor Diana. Now that it was presented to her she had sense and spirit enough to see that it was insurmountable. So, instead of giving in at once, she sat herself to work to think of some other plan, and before supper was half over she had devised and communicated to her devoted Nelly a scheme as wild and apparently as chimerical as even two enthusiastic women ever attempted to put into practical operation.

Before the company separated Diana had filled the minds of her mother, her sister, and Captain Edwardes with projects for entertaining the foreign captives next day. She was herself all for a row down the river, a beautiful, broad stream, or rather estuary, of seven or eight miles, with the sea at the other end of it; her mother and sister were for riding and driving; the French officers seemed rather inclined to avoid the water. Diana pouted.

Would no one take her for a row on the water? She had set her heart upon it. Surely M. le Capitaine—she bungled over the name—would not refuse to go with her? She looked to the O'Dwyer. His face brightened with delight at the prospect of being her companion. Mrs. Polville made no objection. Larry and Tim, the boatmen, would row; Diana would take Nelly her maid with her; it would be delightful!

Although it was daybreak when the guests separated, the boat lay at the little quay by nine o'clock, and the O'Dwyer handed in Diana, who looked fresh and bright as the morning itself. Nelly came with her. Larry and Tim stretched to their oars, and the boat went swiftly down the river. O'Dwyer was in an ecstasy which left him little thought of past or present danger, except, perhaps, a sort of pride and delight in the peril which had awakened even a momentary interest in the heart of the girl who sat beside him.

Alas! a dreadful discovery was made. The boat had sprung a terrible leak somehow, and was filling fast with water. The awkwardness of Tim and Larry and Nelly seemed to make the leak worse and worse as they tried to mend it. They were now near the mouth of the estuary, and sheer, steep rocks rose on either side! They might have been drowned then and there, only that there came rushing and plunging after them a heavy fishing-sloop, called in that part of Ireland a "hooker"—a strong, stout sea-boat, well furnished with sprit and fore sail. The "hooker" came to their res-

cue, and took them promptly on board. By the oddest coincidence the two men who were managing her turned out to be Nelly's cousin and Larry's brother, both devoted henchmen of Miss Diana. The wind was now too strong for them to think of beating up the river again; but they would land the party at a little village on the coast, from which they could easily get home in a few hours on horses or in a cart. Tim was left to get the boat in to the shore as best he might; to him it would be of no consequence, even if he had to swim and push the leaky craft before him. He was to beach it somehow, and then scramble up the cliffs and get home as fast as he could and reassure the mind of Mrs. Polville.

To the O'Dwyer the whole adventure was delightful. It could not well be too long for him.

One of the boatmen—an experienced old "salt"—recommended a "taste" of whisky and water to the whole party. Diana refused the treat for herself, but insisted that "the French officer" must drink some of her mixing. O'Dwyer would have drank any mixture, however Circæan, which she presented, although he was a little surprised at the nervous eagerness with which she pressed him. She mixed some spirit and water with her own hands under the shelter of the sail, Nelly assisting her. They were not very dextrous grog-makers, apparently, for the mixture was a considerable time in process of composition.

O'Dwyer drank off the whole at a draught, with a toast, after the fashion of the day, to the lady from whose hand he had taken it. How queerly it tasted, and how strangely he felt! So languid, so sleepy, that he could hardly speak.

In a few moments he was buried in a deep sleep, and the hooker was flying across the waves with all sail she could bear clapped on. In fact, the two girls had taken the O'Dwyer prisoner, and were carrying him off to France. As he would not himself escape from the custody of the English officers, these two audacious young women had resolved that he should, *volens volens*, be taken away. The boat had been made to leak; the hooker was in readiness by previous and rapid arrangement; the sleeping-draught seemed to Diana absolutely necessary, in order to get rid of untimely arguments, scruples, and protests; for the heroic girl had determined that at any risk the life of the O'Dwyer should be saved by her.

It was well on to the dawn of the next morning when O'Dwyer awoke. Still confused and heavy-headed, he turned and tossed a good deal before he began to recollect the previous day's adventures, and to know where he was. He was lying in the rough hold—it could not be called a cabin—of the boat. He staggered to his feet, and making his way to the deck, saw two female figures sitting close to each other and wrapped in shawls. Diana sprang up all flushed and crimson, though the skies of dawn were chilly, as he approached.

"Miss Polville, where are we? What has happened? How do we come to be far out at sea?"

Land was nowhere visible.

"Only because you are my prisoner, O'Dwyer. I command in this boat, and Nelly is my first lieutenant. Any one who mutinies shall be put in irons—sha'n't he, Nelly?"

"Indeed an' he shall, Miss Di," said the beaming Nelly.

"We have rescued you in spite of yourself, and we are carrying you to France."

"Hurroo for the O'Dwyer!" shouted Nelly's cousin, Larry's brother, and Larry himself.

"Good God, Miss Polville—and you have done this for a perfect stranger—and, I had almost said—an enemy!"

"If you serve those that love you," said Diana, with a smile on her lip and tears full in her eyes, "what thanks have you? Not another word, O'Dwyer! Nelly and I are going to prepare breakfast."

Diana Polville landed her prisoner in safety on the shore of France, and she returned to Ireland as she had left it. Twice, therefore, she crossed the always rough and tossing Channel in a fishing-boat, and she thought nothing of it. Her *escapade*, wild as it was, did not make much talk or get widely known. The faithful Tim, who was sent back after the "hooker" had received her passengers, bore to Ada Polville a few lines from her sister, which enjoined secrecy; and the only persons, therefore, who knew all about the matter were those who were least likely to babble it abroad. Captain Ed-

wardes was admitted into confidence, and he laughed loud and strong over Diana's daring adventure; and, to do him justice, was very glad the O'Dwyer had been spirited away before he, the Captain, representing British power, had been compelled officially to know any thing about the identity of his prisoner. "But I say, Ada—haw, haw!" he added, with a fresh laugh—"you may look out for a rebel brother-in-law; and you'll find that Di will live in France one of these days."

The O'Dwyer rose in the service of France. He became at last a General, and was the representative of France, during days of peace, first at Athens and afterward at Madrid. He had a handsome, brilliant wife, Diana by name, who made quite a figure at both courts and in Paris. He was living—and so was his wife—only, one might say, the other day. But a few years have passed since I saw him, a hale, majestic old man, with a white mustache, driving down the Champs Elysées, with a noble-looking, bright-eyed old lady by his side. Well, it may have been, perhaps, some dozen or fifteen years ago, and they both died soon after, within a few months of each other. But it is certain that Americans who visited Paris at the time of the first great International Exhibition there—the one which followed the London Exhibition of 1851—might still have seen General O'Dwyer and his wife Diana, fresh, hale, and active, and as devoted to each other as they were when she carried him off to the French shore in the memorable days of Ninety-eight.

BRITISH WILD FLOWERS.

BY THE REV. NEWMAN HALL.

Lines Composed at Chilworth, near Guilford, Surrey.

Nothing can exceed the beauty of the banks and hedgerows of Old England in May and June. The ground is covered by flowers of all forms and every hue. After the long winter wild flowers may be even more plentiful in America. It may be interesting to some of your readers to compare these lovely gifts of Nature with those of the old country. One day last spring I resolved, within an hour's ramble among the beautiful hills of Surrey, to gather as many varieties as I could find, and not only make them into a nosegay, but string their names together by the help of rhyme. The following is the result. Of course these lines make no pretensions to poetry; they are mere doggerel; yet a piece of very common thread may serve to combine into a necklace beads of beauty and value.

THIS morning I climbed up St. Martha's Hill,
Of rural beauties to take my fill,
And a nosegay I gathered in less than an hour,
Of which I will try to mention each flower:

The *Daisy's* bright glances illumine the lawn,
As its eyelids it opens to welcome the dawn;
While *Butter-cups* yellow and *Sorrel* so red
Their mingling tints o'er the green meadow shed.
Ground-ivy its purple and green intermingles
With *Do-not-forget-me's* to carpet the dingles.
The *Stitch-wort*, like stars, we *Stellaria* call,
White-flowering grass, so graceful and tall,
Also called *Satin-flower*, wherever we go,
Bedecking the banks with gems white as snow.
Dear old *Ragged Robin*, so rough and so wild,
And *Campion Red*, almost a twin child,
But somewhat more orderly, tidy, and trim,
And often, I fancy, mistaken for him.

Bladder Campion, too, which is *Campion white*,
Inflated in flower-cup, plain to the sight.

Wood Strawberry blossoms trail over the bank,
Whose fruit, red and sweet, eye and tongue
soon will thank.

The *Tufted Vetch* is purple and red,
As under the hedgerows it lifts its head;
And the *Meadow Vetchling* is yellow, and grows
Not so much in tufts as in rows.

The *Hawkweed's* a sort of refined *Dandelion*,
Which the bird of terror, they say, does rely on;
Its lemon tint and its petals fine

On the soft, downy turf so pleasantly shine.

The *Yellow Broom* illumines the banks
With *Foxglove* in gracefully nodding ranks.

And *Golden Gorse*, at which Linnæus knelt
In praise to God for the great joy he felt.

The nightingale is singing now
Above the fragrant *Hawthorn* bough;

The thrush is trilling where the *Rose*
 In wanton wildness sweetly blows,
 And mellow blackbirds charm the bower
 Made by the *Elder-berry* flower.
 The *Dead-white-nettle* now I take;
 No sting will make the finger ache
 Like it, the *Yellow Weasel Snout*;
 Why named, on smelling you'll find out.
 The *Ox-eye* is a daisy giant,
 With stem tough, strong, and tall—defiant.
 The *Creeping Cinquefoil* is pale yellow,
 Named also *Potentilla*; fellow
 To the lovely *Silver-weed*,
 With silky leaves that shine indeed.
 Wild *Parsley* spreads its flowers profuse,
 White, straggling, tall, unfit for use.
 Blue *Hyacinths* are lingering still
 In a shadowy nook beneath the hill,
 Where oft is heard the cuckoo's shout,
 And rabbits are frisking in and out.
 In hedges *Honey-suckles* twine,
 And the *White Bryony*, like the vine;
 The *Purple Trefoil*, known as *Clover*,
 Scents the air the region over.
Malva Silvestris, wherever you rove,
 Is known as the *Mallow*, its color as mauve;
Herb Robert, *Poor Robin*, or *Crane's-bill*, named
Wild Geranium also, for beauty is famed.
 The mem'ries of childhood fondly linger
 With *Lady's Slipper*, or *Lady's Finger*,
 Called *Bird's-foot Trefoil*, as I suppose,
 From shape of the flower and leaf as it grows.
Hedge Wound-wort, with its purple spire
 And downy leaf, we next admire;
 Once highly prized for power to heal,
 And from the wound the pain to steal.
Wood Loosestrife (yellow Pimpernel),
 Used by *Lysimachus*, they tell,

Upon the yokes of oxen wild,
 To make them tractable and mild;
 Thus, by translation of his name,
 This feeble flower prolongs his fame.
 The trailing blossoms of the *Brambles*
 Foretell our jolly Autumn rambles
 In quest of fruit for jam and cakes,
 Which Bridget oft for supper makes.
 Its stem erect, the *Bugle Blue*
 As *Carpenter's herb* our fathers knew,
 With power to heal; along the ground
 Its creeping shoots are always found.
Musk Thistle derives from its odor its name,
 Thistle in form, but more smooth than the same;
Shepherd's Purse or *Pickpocket*, its three-cornered pods
 Full of seed, for small change, exultingly nods;
 And *Calamint* od'rous, oft used as *Bohea*,
 Its tiny blue trumpet holds out to the bee.
 Amid the corn the *Burridge Blue*
 And *Pimpernel* so scarlet grew,
 The *Poppy* waved his pennon red,
 All up the bank the *Wild Thyme* spread,
 And pink *Convolvulus* displayed
 The vase-shaped flowers that shun the shade.
 In my nosegay of flowers, composed of so many,
 The last and the least, but as lovely as any,
 Is the *Cat's-eye* or *Speedwell*, with three petals equal,
 The lowest is smaller, and makes up the sequel.
 How smiling and cheerful it renders the banks,
 And bids the beholder to pour forth his thanks
 To Him who by flowers proclaims He is Love,
 And through Nature directs us to heaven above!
 Praise we then the God of flowers,
 Tinted banks and fragrant bowers;
 Hallelujah! praises bring
 Unto Christ, Creation's King.

My nosegay consisted of forty-six flowers, which I have here enumerated. I must really crave the reader's indulgence for the roughness of the rhymes; but really it is not easy to bring in all the common names with some of the characteristic features of so many flowers. Doubtless many are known in America by the same names. But you must have many which we know not, and perhaps some of ours are unknown to you. But there are some which link together the sympathies of all nations. The daisy is found every where—in all climes, in all regions, in the garden, the forest, the prairie, beneath the tropical sun, on the rocks of Greenland, on the edge of the glacier, high up on Alpine peaks. And the primrose, I should think, is to be found almost every where. It began to flower with us at the end of January. My little garden has been radiant with these gently-shining stars of spring these last six weeks, and their light will not be quenched for six weeks still. I was bringing home some roots from a ramble in the Surrey woods the other day, and amused myself while in the cars with stringing together the following rhymes:

THE PRIMROSE.

I love the early primrose
 That lightens up the lane—
 So radiant in the sunshine,
 So cheerful in the rain;
 "Good-by" to dreary winter,
 How gladly doth it sing,
 And tells of milder weather
 And hopeful, happy spring.
 I wish that, like the primrose,
 My life was always bright,
 And shone in darkest pathways
 With mild and constant light;
 I wish that I reflected
 Each sun-ray from above,
 I wish that 'neath the storm-cloud
 I always smiled with love.

I wish that in the valley,
 As on the swelling hill,
 Seen or unseen, with beauty
 I did my task fulfill;
 In life's retired copses
 As in the garden gay,
 Beside the forest foot-track
 As by the broad highway.
 I would be ever showing
 That winter's reign is o'er,
 A happy pledge and promise
 Of joys for evermore:
 I would be like the primrose,
 And sing in sun or shade
 Of spring that's everlasting,
 Of flowers that never fade.

PAWNBROKERS AND LOAN-OFFICES.

THE use of both real and personal property as security for the payment of debt seems to be founded in the "very nature of things;" and the necessary distinction between such use of the real and the personal seems also to have been well understood from the earliest ages, as is evidenced by what fragments have been preserved of the most ancient laws. The Mosaic law may be instanced as a clear example. From time to time, however, the more powerful interests involved have directed the attention of law-makers primarily to the regulation and protection of loans on real estate, and afterward to such as could be classed as commercial securities and loans; while comparatively little care or study has been given to the methods and customs which only touched the welfare of those classes, however large numerically, who had no claim to political or commercial importance. In some of our most enlightened Christian countries to-day—as for instance our own—no more, or more intelligent protection, is accorded to those who borrow money simply because they bitterly need it, than was given by the Jews on their Emancipation, or by the Chinese before the beginning of the Christian era. It is doubtless true that much of this apparent apathy has been caused by the deep-seated prejudice which has from all time existed against usurers and their practices, and in later days against pawnbrokers especially; and this very repugnance has not only prevented discussion and legislation, but has forced a business, whose proper and merciful performance deeply concerns the welfare of the poor, into the exclusive control of a class of men whose social and commercial position has been only removed by their wealth from that of outcasts. Indeed, even if he displayed every possible distinguishing mark of good citizenship, the pawnbroker has never been able thereby to relieve himself from the stigma attached to his profession. The "three balls" have been far worse to be carried in any escutcheon than the "bar sinister" itself.

The system of pawnbroking established among the Chinese is of unknown antiquity, and may be carried on only by persons of fair character and known solvency, under licenses prescribed by law. One of their regulations provides that, while in summer three per cent. a month may be charged on articles of wearing apparel, only *two* per cent. is lawful in winter, "in order that the poor may the more readily redeem." It will be noticed in this article that the rates of interest charged by *legal* pawnbrokers, as well as their customs and methods, are singularly in accord the whole world over. The systems prevailing among the Greeks and Romans are involved in controversy; but for nearly thirteen hundred years after the coming of Christ the Christian world groaned under uncontrolled exactions, which must have been even worse than

those practiced in the United States at the present time.

The exact date at which the first intelligent effort was made for relief is involved in some obscurity. Bavarian authorities claim that the first "Mont de Piété" was established in the town of Freisingen in the twelfth century, and that this was the germ of all subsequent institutions of the kind. It is reasonably certain, however, that we are indebted for the idea and its practical application to the benevolent monks of the religious orders, whose pious labors among the poor, as well as their acquaintance with the occasional necessities of the middle and upper classes, made them better informed than other men concerning the cruel extortions practiced by the Jews, Lombards, and other professional usurers.

In the latter half of the fifteenth century, by the efforts of the venerable Father Barnabas of Terni, such an institution was established at Perugia, in Italy, and the name of the hill, "Monte di Pieta," upon which it was situated became a sort of generic term for that and the long list of similar creations which followed it. One was attempted in Parma in 1488, but does not seem to have flourished, and the greatest authentic antiquity of any now in existence belongs to that of Padua, which dates from 1491. At about this time also they were introduced in the Netherlands by an artist named Wenzel Coeberger, who became acquainted with their workings during his "artist life in Italy."

These original Monts de Piété were purely benevolent, furnishing loans without interest, and were at first sustained in part by the state in some places, but mainly by the contributions of the charitable. It was not until time and experience had shown the wisdom, if not the necessity of so doing, that they were made self-supporting, and even a source of moderate revenue. Their present development and management is the result of centuries of growth and experience, and will be more fully described.

The Mont de Piété at Rome is variously ascribed to Pope Leo X., 1513 to 1521, or to Pope Paul III., 1534 to 1549, and has been perhaps the most remarkable perpetual museum of all the movable works of men's hands of all nations that the world has known, so natural has it seemed for pilgrims to become "hard up" during their stay in the Eternal City. Some of the other important existing institutions date as follows: that at Amsterdam from 1568; Augsburg, 1591; Brussels, 1691; Antwerp, 1620; Ghent, 1623; Rheims, Lyons, Marseilles, and some other French cities about the middle of the seventeenth century.

Nowhere has the Mont de Piété been more thoroughly systematized than in France, though now fully established all over the continent of Europe; and its management there may be taken as a fair example of the whole, though, unfortunately, the very latest official reports do not seem to be obtainable in this country. The institution was founded in Paris in the year 1777,

and was opened for the transaction of business on the 1st of January, 1778. It languished at first for lack of sufficient funds, but in 1779 was authorized to contract a loan, guaranteed by the revenues of the *Hôpital Général*. From this time it met with fair success during a few years, but was closed during the "Reign of Terror," a shock before which all institutions alike seemed fated to tumble. In 1797 it was re-established, but did not get fairly under way until 1803, when its reopening was hailed with loud acclamations by the people, who looked to it for relief from the exactions to which they had been subjected in the interim. In 1804 it obtained a government monopoly of all pawnbroking business, illegal transactions being forbidden under severe penalties. In 1831 it was placed under the charge of an Administrative Council, the President of which was the Prefect of the Department of the Seine. From this time forward it continued to be regarded erroneously as a charitable institution, although it had become fairly and legitimately self-supporting, until the year 1851, when it was separated from the other "hospitals," and has since been looked upon in its proper light, as a financial institution, under government supervision like others, but devoted to supplying a peculiar class of banking facilities to those borrowers whose securities were other than "commercial."

The money employed is derived from the contributions of shareholders to the capital stock, from the surplus funds of public charities, and from the "security money" deposited in the French national treasury by government employes, but mainly by a system which may be described as follows:

The Mont de Piété is made to partake of the character of a savings-bank, and receives deposits in sums of 250, 500, 1000, and 10,000 francs; for which it gives its notes at twelve months, with 3 per cent. per annum interest. The depositors are for the most part small tradesmen, who prefer these notes to temporary investments in the public funds.

Not only are a large number of agents and sub-officers employed in Paris itself, but the system has been gradually extended to the rural districts, until there are now more than fifty "Monts de Piété" in the "cantons." The business of these has not yet, however, obtained a fair proportion to that of the capital. It may be mentioned, by-the-way, that the small territory of Belgium contains twenty, while the prudent and careful Hollanders sustain more than a hundred.

The borrowers are of all classes, and frequently to very considerable amounts, though the greater number of them, of course, are to be found among the very poor. Loans are made on all classes of goods to the amount of two-thirds of their cash or "sacrifice" value, except on articles of gold and silver or precious stones, on which loans of four-fifths are permitted. One year is allowed for the redemption of pledges. If not then redeemed the pledges

are sold at auction; and the surplus, if any, after payment of principal, interest, and slight charges, is held three years for the benefit of the owner. If not called for in that time the surplus is considered totally forfeited, and goes into the treasury of the institution. Interest is charged at the rate of 1 per cent. per month, and no variations from this are made for different classes of merchandise or of borrowers.

So far back as 1833 the Paris Mont de Piété kept in continual use about \$2,500,000 in gold. The average number of articles pledged per annum in Paris alone, for the fifteen years ending with 1852, was 1,313,000; total number for the same time, 22,860,000. The average loan for the same period was 17 francs 40 centimes. In 1847, in all the French Departments, the total number of articles was 3,400,887, valued at 48,923,251 francs.

The proportion of pledges unredeemed varies very much in different localities, according to the character and employment of the inhabitants, and also with the condition of the current business year. The managers report that, at 1 per cent. per month, which is the equivalent of 2 per cent. in the United States, no loans of five francs and under (one dollar) pay the expenses of record and handling, and a very brief examination suffices to show that this must necessarily be the case. These and other losses are made good by the surplus profits arising from loans of a larger amount, and which remain on interest for a longer time. The average number of loans per day is a little more than 4000, but on Saturday this rises to 5000, and frequently to 6000. It is vaguely reported that the business, not only in Paris, but in the cantons, has largely increased of late years, with the increase of population, wealth, extravagance, and the increased pay and luxury of the skilled mechanic classes.

These, and similar institutions all over Europe, as they have been managed, seem to have been singularly exempt from the effects of all financial panics and political revolutions. Except in the single case of that of Paris during the Reign of Terror they have been respected even by the mob, having every where secured and maintained the character of popular institutions and friends of the poor. Their self-supporting properties have been also fully established, and, although by no means so profitable pecuniarily as might seem from a hasty examination, they can not fairly be regarded as in any sense "charities." They are simply financial institutions founded on sound principles, conducting their business in a legitimate manner, and answering a great and fully-recognized social necessity.

While all this has been accomplished on the continent of Europe, England, with her proverbial indisposition to adopt any thing new, has remained almost stationary. Abortive attempts were made by benevolent citizens, at quite an early period, to introduce the Continental system, but with little encouragement.

In Glasgow and at Limerick, in 1837, a good beginning was made, and it is understood that at other points in the United Kingdom very respectable institutions are now flourishing; but their growth has been slow compared with those of France and the Netherlands.

In the year 1800 the various conflicting English statutes were consolidated and amended, so that the business of pawnbroking is now conducted under the provisions of a special Act, 39th and 40th George III., July 29, 1800. Such municipalities as are so permitted in their charters are allowed to grant licenses subject to the restrictions of the Act. The rates of interest are minutely adjusted on a graduated scale, but on all the smaller sums average about 1 per cent. per month, "with expenses." The time of forfeiture is one year, and the net surplus is held, subject to the owner's order, for three years. The well-known emblem of the "three balls" had its origin in England, not, as has been humorously suggested, in the idea that "it was two to one if the pledge was never redeemed," but in a set of Lombard merchants, whose "coat of arms" it was, and who first introduced pawnbroking into London as a distinct business, giving their name also to the since famous thoroughfare of Lombard Street. Usurers in general were for a long period denominated "Lombards" in England, the epithet being considered in a high degree opprobrious.

Coming now to the United States we find that we are worse off than England is now, or than even our wise friends the Chinese have permitted themselves to be since a time when the records of the mandarins do not specify. Not only are we without a general Act for the nation, but, to all intents and purposes, for any one State. Our system, or rather our want of any, must have been imported from England, as most of our legal institutions were prior to the year 1800, and we are about where the mother country was then.

The several States have been contented to leave the matter to the local governments of such towns and cities as are duly authorized for the purpose in their several charters. The result has been a wide diversity in the rules and regulations provided, as well as in the rigor of their enforcement; and in not a few important municipalities the business has been left entirely to such enterprising operators as will be shortly described, and who have boldly emancipated themselves from all laws whatsoever.

Thus while Albany, in this State, lets the pawnbrokers pretty severely alone, Buffalo allows (or did a short time since) the collection of 3 per cent. per month, with a forfeiture at one year. Rochester restricts the interest to 20 per cent. per annum, but allows a forfeiture at the end of six months. Baltimore not very adroitly strives to dodge the woeful enormity of exacting usury by a funny device which fixes the interest at 6 per cent. per annum,

but forces a renewal of the pawn-ticket every month, and the payment of a "ticket fee" of 6½ cents for each ticket under \$3; of 9 cents for \$5 and under, and so on up, in a gradually diminishing scale, as the sum climbs out of the reach of the really starving poor. By this system a loan of a dollar pays 6½ per cent. per month, with a forfeiture and sales at the end of six months, the surplus, "if any," to be held for the owner. Philadelphia somewhat resembles Baltimore in various respects, and allows 3 per cent. additional on sums of one dollar, with sale and forfeiture at the end of one year.

In the State of New York the Revised Statutes provide generally for about the same amount of privilege and supervision as is specified in the case of the city of New York by its charter and the several confirmatory and amendatory acts. By sec. 2 of the Act of April 2, 1803, the Mayor and Commonalty of New York were authorized to make laws and regulations to govern the business of pawnbroking within the specified limits, and the same provision is more elaborately repeated in the Act of April, 1813, secs. 263-4-5. The Mayor may be empowered to grant a license, exacting a license-fee of not over \$50, with bonds of not over \$1000, for obedience to the city ordinances. Interest is restricted to 26 per cent. per annum, and loans on each article are not to exceed \$25. In pursuance of the authority thus given, various action was taken from time to time by the city government; but all was amended and consolidated in the Ordinance of 1859, which provides, chap. 43, that:

"The Mayor shall grant licenses to persons of good character only.—That the license-fee shall be \$50.—That two securities shall be given, in the sum of \$500 each, that the party obtaining the license shall abide by the several provisions of the ordinance.—That he shall keep a proper record of the deposit and redemption of all pledges.—That he shall give to each pawner a proper descriptive ticket.—That the said record shall be continually open to police inspection.—That a fine of \$25 shall be paid for each violation of the provisions of the ordinance.—That no more than 25 per cent. per annum interest shall be charged.—That no more than \$25 shall be loaned on any one article, and that no article shall be artificially divided for the purpose of increasing the amount loaned.—The sale of pledges under one year's time is forbidden.—Such sale must be by auction.—The surplus, if any, must be paid to the owner of the pledge, *less expenses*."

In pursuance of this ordinance there are now no less than *seventy-one* licensed pawnbrokers doing business on Manhattan Island. Their business is with the very poor, for the most part, and while it is impossible to obtain minute and correct data of its amount, it is well known to be very large. Fair justice to the pawnbrokers, however, makes it right to say that it does not appear that their profits are altogether exorbitant or unreasonable, as compared with other legitimate business. It is generally understood that the capital of these concerns is furnished by parties of greater financial reputation and social position than belongs to the agents and managers who perform the actual drudgery of

the business. The following is a copy of an ordinary pawn-ticket:

TIME OF PLEDGING.	DESCRIPTION OF GOODS PLEDGED.	AMOUNT LOANED AT 25 PER CT. PER ANNUM.	
1867. 12th Oct.	<i>One Ring.</i>	DOLLARS.	CENTS.
No. 738/79		4	50
NAME AND RESIDENCE OF PERSON PLEDGING.			
<i>Israel Smith, 10 Brooklyn Ferry.</i>			
ABRAHAM LEVI, 10 Great Fourth Street, New York.			
<i>Not accountable for Loss or Damage by Fire, Robbery, or Moth.</i>			

On the reverse is, nowadays, a United States Internal Revenue stamp, of five cents, the cost of which does *not* come out of the pocket of the pawnbroker. Thus, if a poor washer-woman pawns her flat-irons for a month, she pays the dignified treasury of her country more than twice the amount which she pays as interest to the sign of the "three balls." Why this should be so does not come within the scope of this article to discuss.

During the summer months the business of the pawnbrokers, though good, is not by any means pressing. The laboring classes are then, for the most part, well and profitably employed, and if it were not for rum, idleness, and real misfortune—such as sickness—there would be comparatively little for "my uncle" to do. As winter comes on, however, one source of employment after another is closed, expenses increase, while, curiously enough, miscellaneous crowds with slender resources flock in from the country. In this city the stream of people from over-sea furnishes a never-failing supply of business to the pawnbroker, and these people seem to hold off wonderfully until the approach of cold weather. Then, however, his shelves begin to fill up. All the early summer they grew thinner, as one pledge after another was redeemed by those who once more found a remunerative demand for their time and labor; but now even the rapidly accruing "forfeits" do not make room enough for the fresh offerings.

Bits of jewelry; furniture; clothing of all kinds; relics of better days; odd mementoes of far away lands beyond the sea; articles of domestic use beyond mention—or unmentionable—all is fish that comes to his net, if only it have a market value, or, in his opinion, a reasonable prospect of ultimate redemption. Hardly an article is offered upon which the pawnbroker is not begged to advance "more," but his trade hardens him, and he invariably decides in accordance with what he considers his own interests. These, be it understood,

prompt him to loan as much as he safely can upon each item, for a forfeit is by no means an invariable profit. He sees before him, all day long, and all the year round, the improvident, the reckless, the vicious, and the victims of unutterable misfortune. It is not his fault that he becomes hardened, and yet he fills an important and useful place in society—a place that must and will be filled, and that always has been filled.

Society, as represented in power at Albany and elsewhere, has ordained that the necessities of the poor shall be thus supplied, and in no other way, and, for the lucre set before him, the pawnbroker consents to be the humble instrument of that enlightened and public-spirited fiat. It is no matter of his concern that every nation of Christendom, except America and England, long ago rebelled and instituted a better order of things; he takes things as they are, and stolidly collects his two per cent. per month, *with expenses*, and takes care that the latter shall make good any deficiencies, real or imaginary, in the rate of interest.

It is not so often as is popularly supposed, perhaps, that the licensed pawnbrokers are brought under the eye of the legal authorities as receivers of stolen goods. Not only does their accountability to the police exercise a wholesome influence, but their liability to the lawful owners of goods fraudulently obtained has a tendency to render them careful, even if they were otherwise disposed to be unmindful of their duties as citizens; and their acquaintance with certain grades of our criminal population is such that they are not likely to be made the unwitting accomplices of even petty theft. Moreover, the spoils obtained by the more active thieves of the metropolis are generally of a nature and value to call for the services of a different class of men, some of whom may be herein mentioned.

It is a fact which none are more ready and willing to substantiate than the pawnbrokers themselves, that they do but a fraction of the business of loaning money on pledge of personal property in the city of New York. Most of it is really placed beyond their reach by the law. At least two-thirds of all such business is done by men who pay for no license as pawnbrokers or tax of any kind, are amenable to no law, give no bonds, and are only governed in their rates by the necessities or ability of the individual applicant. The daily papers teem with the advertisements of these men, and their offices may be found, at frequent intervals, throughout all the business portion of the city.

They are keepers of "loan offices," diamond brokers, auctioneers, lawyers, who have on hand funds to dispose of for their clients; and they even nestle among the more aristocratic neighborhoods without any external "sign" of their calling. In fact, nothing is really easier than to evade the law, if the attempt be made with sufficient effrontery, and a good knowledge of the position.

We will suppose that a gentleman from the rural districts has been imprudent in his expenses, and desires to use his watch as a collateral for a small loan—say fifty dollars. As he saunters up Broadway, wondering how his desire may be best accomplished, and with more than a little half-concealed nervousness concerning the business in hand, his eye falls upon a sign which announces that “So-and-So, Diamond Broker,” makes advances on precious stones, watches, etc. Evidently here is his man. As he steps into the office the dapper young man behind the counter reads him at a glance, and his application for a thirty-day loan is at once assented to, as a matter of course. The money, a trifle less, perhaps, than he had expected, owing to the somewhat old-fashioned character of his time-piece, is counted out to him, and he again descends to the street, with his receipt in his hand.

Now let him examine that same paper. No mention is made of any deposit or sale by himself to the gentlemanly “broker,” but he holds in his hand an agreement from that person to sell him thirty days from date, at a price named, a watch whose number and description are only too familiar, while the barest trifle of simple arithmetic enables him to see that the transaction nets the “broker” fifteen per cent. per month for the use of his money. There is no use whatever in storming. Even the lawyers and the police can not help him. *He has sold his watch*, and though he can buy it back again at any time within the thirty days, he can not hope to obtain it for one dollar less than the price specified in his written contract. If his necessities continue, and the contract expires, he has no help whatever in the law against illegal pawnbroking, and his watch is *gone*. But he may have been an old customer of that same broker. He may have brought in many watches, of various patterns and values. Some of them he may have redeemed, and others not. His very personal presentation of a security may be a reason for its speedy disappearance on his departure. Nothing need be said; but on his failure to redeem, that watch will hardly find its way again into the regular channels of trade. The cases go to the melting-pot, and the works make their second appearance long afterward in such a guise that their own maker would not know them.

With diamonds and other precious stones there is even less difficulty. The settings are of comparatively little account, and are melted up at once, while the gems themselves are promptly invested with new clothing, unless any peculiarities render a trip beyond the seas advisable—and is there not a good market in Europe? Does not Europe find America equally convenient for similar purposes? But, as the diamond brokers and watch fanciers can not properly attend to all the departments of this interesting business, a good deal remains for the “auctioneers.”

No pawnbroker will or can make a satisfac-

tory advance on your piano, and, as the instrument is a good one, you really do not wish to have it sold until you have had a chance to recover yourself. Nor need you, for there are plenty of establishments where you can obtain a temporary “advance” by giving the auctioneer a written power to sell at a day specified. Should you return the said advance, and demand your property, before that time, you will only be required to pay the commissions, fees, cartage, storage, and other expenses, specified in the document you have signed, with lawful interest for the use of the money advanced. Well for you if it all does not look and figure up singularly near to fifteen per cent. per month. This thing is well known at the Mayor’s office and in the courts, but sharp as our lawyers are they have declared it beyond their reach.

You have a life insurance policy which has been maintained, with necessary payments, until it has acquired what the companies denominate “a surrender value,” and you wish to obtain a loan upon it. The Company in which it is held is forbidden by law to accommodate you; money is scarce, and you are driven to answer an advertisement which you fortunately saw in the morning paper. The loan agent tells you that he is only employed to invest the money of other people. He will ascertain if it is all right at the insurance office, and let you know in the morning. When the morning comes he will by no means violate the law against usury, but if you will transfer to him the policy for a certain sum he will agree to re-transfer it to you at a given date for another and somewhat larger amount. If your necessities compel you to accept, be sure that no Actuary of any Insurance Company ever took a keener glance at your bodily promise, for if you do not redeem, and are hopefully sickly, he may keep the policy good until the day of your death. If not, the “surrender value” amply secures him against possible loss.

It would, however, be a useless and ungrateful task to follow the almost innumerable thoroughfares by which those who are so disposed drive whole “Santa Fé trains” through the jumble of State laws and city ordinances with which the subject of illegal pawnbroking is so hopelessly hedged. A few more kindred statutes would compel Mrs. Partington to retire with her broom in confusion from the shores of any imaginable Atlantic. Even to a greater extent than is the case with the licensed pawnbrokers the capital of the “loan-offices” is understood to be furnished by men of means, whose names do not appear on their gilded signs, but the amount is ample, and is always forthcoming to good security and satisfactory returns. It is not to be understood, of course, that all who loan on plate or jewels, or who make advances as auctioneers, are alike lawless and extortionate; for these occupations are also carried on by many of our best citizens.

Sundry inquiries instituted among the establishments thus described have elicited curious

facts, other than those which relate to the disposal of goods whose ownership is doubtful. The "agent," as a general thing, prides himself on his "honor," and though he has given no securities, and is hard to reach by any process known to the law, comparatively few cases are reported by the police in which the property so singularly pledged has failed to be forthcoming, if called for, on the day appointed. This is the more remarkable when we reflect on the opportunity and great temptation given for out-and-out robbery. Now and then, however, something occurs in the way of a "failure in business," or a sudden disappearance, and such things are regarded by "the trade" as in the last degree injurious and unfortunate, as tending to interfere with the confidence of the public, and therefore with the amount of their business.

Among their clients, too, as they will sometimes freely relate, without divulging names confided to them, are not seldom to be found some who are hardly suspected by society of resorting to such means of raising the wind. More than one fashionable leader has been known to procure the means for her summer trip to Newport or Saratoga by depositing with a "broker" or an auctioneer such articles of value as she would not require in her absence; trusting to luck, or her husband's liberality, for their redemption on her return. Parties in the winter time have been provided for in the same manner; and such loans are made with the greatest readiness, on the double pledge thus given of "good security" and the family honor. If the thing should be discovered by the husband or father, he may storm at home, but he will surely redeem the pledge, even if his bank account is severely pinched thereby.

Some of the articles most available for loans in these various establishments may be thus enumerated: diamonds and other precious stones, set or unset; watches and jewelry of all kinds; gold and silver plate; carriages and harness; pianos, and valuable furniture generally; dry-goods in the piece; furs and expensive wearing apparel; life insurance policies; stocks and bonds which have a value, but which are not available at bank; notes of hand which no bank will take, but which the "agent" has good reason to believe will be met at maturity—a very delicate branch of the business; and, in short, any thing which can be readily turned into money at *some* price.

It is self-evident that the business of loaning on pledge of personal property will always bear a direct relation, not only in its gross amount, but also in the average of the sums required for the several loans, to the general prosperity and population of any community, the habits of its individual members, and the stability of the popular finances.

In a city like New York, therefore, and many other American cities, with an ever-shifting, restless population, drawn from all parts of the country and the world; fond of dress and ornament in their persons and display in their style

of living; subject to almost periodical fluctuations in their pecuniary circumstances; the field of the money-lender, untrammelled by any law for which he cares a button, is almost unlimited. The only other city in the world which can be compared to New York is Paris, and even the French metropolis is believed to be not at all in advance of the feverish American. The 35,000,000 francs kept in constant use by the Paris Mont de Piété would as readily be absorbed in the business of a similar institution among ourselves.

It would hardly seem to require any extended argument to show that all this oppression of the unfortunate and stripping of the improvident, this systematic and wholesale disregard of law—which may indeed be regarded as almost compulsory—is fraught with the very worst consequences to the well-being of society. And society feels the drain, too, in a sleepy and unreasoning sort of manner, and vents its instinctive resentment for the injury done in an increasing bitterness of its narrow prejudices against all who undertake to loan it money on its time-piece or its diamonds. So fixed and spiteful is this feeling, indeed, that they must needs be bold and strong men who shall attempt in any manner to stand up against it, even for the public welfare.

If now we turn once more to France, we shall find that certain business principles have been well established by long experience and careful study. The savings of the prudent and industrious are employed, on safe security, in relieving the wants of what may be termed the borrowing class. The amount is only limited by the security offered, that as little field as possible may be left to illegal operations. The interest charged is reduced to the minimum of soundness and remuneration, and no advantage can be taken of instant and pressing necessity, for the rate is uniform. Extortionate "charges and expenses" are done away with, so that the surplus, after forfeiture and sale, is actually, as well as theoretically, "held for the owner." Security is given against loss by fire or theft.

The machine is a great automaton, alike without pity and without greed, moving on regularly within its defined limits. The person who assesses the value of any pledge tendered through the receiving-clerk, and declares the limit that may be loaned thereon, never sees the person who brought it, and can not be reached by any pathetic appeals for "more." His judgment is final, and still another official hands over to the "pawner" the amount that is loaned him.

The functions of these three men, the receiver, the assessor, and the cashier, in this country are invariably consolidated in one person, and this of itself is an evil in many ways.

If we examine carefully the history of the laws relating to the employment, as security for loans, of such personal property as may be denominated strictly "commercial" in its character, we shall find that it was not until such

use became a general necessity with a large and reputable class, and acquired considerable volume, that it was emancipated from narrow and vulgar prejudices. The business of supplying capital for such loans, however, though carefully restricted by jealous laws, has become the special care of nations, and is in the front rank of honorable employments, while, with a degree of contemptuous prejudice that would be almost ludicrous but for its fearfully cruel consequences, the business of supplying loans on "uncommercial" security has been placed under the ban of society, or altogether beyond the control of the laws. Meantime the interests affected are assuming such enormous proportions, and involve the well-being of such vast and increasing numbers, that every man who does not willfully shut his eyes to the truth readily admits the necessity for some action that affords a promise of relief. That such relief can not be attained by any species of prohibitory enactment is too clear to call for any argument. The people whose necessities compel them to borrow money *must* go to the only sources from which they can obtain it, whatever those sources may be. As a general thing no time is left them to "pick and choose" for advantageous terms. They would gladly borrow this money at low rates and on long time; for no man ever *prefers* to pay usury; but no such privilege has in this country been provided for them. The laws curtail the power of even the licensed pawnbrokers to furnish the required assistance. Moreover, on these larger loans, 2 per cent. per month, "with charges and expenses," is altogether too much, while the legal rate may at the same time be insufficient to tempt capital to such uses. In practice it has been found so. The uniform rates of the Monts de Piété seem to have solved this difficulty. The reason of this may be found in the fact that a "pawn" is not in the nature of a mortgage; the pawnee acquires no property or use in the article pledged, and is bound to retain it in his possession. He can not re-employ it as a means of obtaining further capital, and his "banking" may thus be said to be reduced to "single entry."

So strongly has the state of things set forth in this article been brought home to the minds of our more intelligent financial men, that, at the time of writing it, a charter is pending before the New York Legislature for the incorporation of an institution for this city, framed on the model of the Parisian Mont de Piété, though embracing even more liberal provisions for the protection of the interests of the poor. The parties engaging in the enterprise are second to none among our reputable and responsible citizens, and may be safely intrusted with the development of their important undertaking. At the same time similar movements are understood to be organizing in Boston and Philadelphia. The special charter system, however, ought no more to be applied to this business, except during its experimental era, than to any

other species of banking; but as speedily as possible a scientific system should be developed which will admit the application of a general act, that the expansion of facilities may be in proportion to the demands of the people, and that any thing like monopoly may be shunned. It is a marked feature of the charter in question that it assumes the form of a "Mutual Savings Institution," with all surplus profits divided among its depositors—a plan which has already been found to work admirably well in practice.

The adoption of some such remedy is and can be only a question of time, even if the present effort should prove unsuccessful. We are far too shrewd, as a people, to long insist that our most needy classes shall be the worst protected, or that our laws should be left in a shape which renders their infraction morally compulsory. So long, indeed, as only the flat-irons and cheap watches were involved, and we imagined that the whole business passed under the sign of the three balls, in insignificant dribblets, we might have snubbed the whole question with supercilious contempt; but now that the French statistics have given us some fair hint of what our own must be, and the columns foot up with millions on millions of gold, paying interest at from thirty to one hundred and eighty per cent. per annum, and with forfeitures which call to mind the snap of an alligator's jaws, the whole thing assumes a different aspect, and we shall be willing to "do something."

Nor will it be hard, either, for "so shrewd a people," to ascertain that there is but one thing to be done, and the experience of Europe will be acted upon. An unlimited supply of money at a low rate will enable the borrowers to laugh at all attempts at extortion, and the shattered laws will have a fair opportunity to recover their self-respect, if not that of the people.

The legitimate business of the licensed pawnbrokers will be but slowly affected by the introduction of the Mont de Piété in America. The real execution will be done among the illegal dealers. So well do the former understand this that as yet but little jealousy has been expressed on their part. The new system will necessarily be of somewhat slow growth, for it is an exotic, and must gradually become accustomed to our soil and climate. All who pity the poor in their distress, or the victims of sudden misfortune, or even of their own folly, will hope for the success of the proposed reformation.

THE PRIMER OF THE WORLD.

SOMETIMES there is discovered an old vase or stone, covered with strange characters that are not to be found in any books now read. But men compare them with other stones engraved in characters that have been read, and by putting this letter and that together, make out, perhaps, the name of a king, his battles, and his captives, who had all been forgotten hundreds of years ago.

Now yesterday I saw a leaf from the book of the old world, and on it was written the history of millions of lives and deaths that happened under the waves in a sea-city. The little sea-people are all dead, but there were their houses, packed together by millions, as I tell you. It told also a yet more surprising story, of how this sea-city and many others like it had been lifted from the very bottom of the sea to the tops of the highest mountains. If you would like to know the name of this leaf it was a limestone rock; and I read this story something as men make out the characters on the old stones and vases. It was not written in our A B C's, you may be sure, but the same characters are still used on earth by two mighty workers, Fire and Water. And by studying their handwriting you will recognize it wherever you meet it as certainly as though it was written plainly—Fire, his mark, or Water, his mark.

If you would like to know more about this old world book there are sure to be bits and shreds of it in all your houses. For instance, in every lump of coal is written a story, prettier even I think than that of the limestone—a story which I should like to tell you by-and-by. But the book itself is the solid earth. We may call the ground on which we walk the cover, ornamented with cities, mountains, and seas. The leaves are beneath, laid regularly in such order, one over the other, that we come in digging down first to the last leaf, and reach the first leaf last. These leaves are of rocks of different kinds, as granite, limestone, and chalk, or of coal, or of different clays and sands, mixed in with corals, pebbles, and shells. Some of these rocks are made up of thin layers or slices placed one over the other. In some we find bones, shells, and skeletons of strange animals. Some are made wholly of shells, the houses of the little sea-people of whom we were talking. All of them are written thick with the history of how God made the world.

Should you like to understand this writing? To do that, then, we must try and find something that builds now in layers of mud and sand, and piles up pigmy cities in rocks, and hides shells and skeletons in solid rocks.

If you live near the shore, no doubt you have seen, especially in a storm, how the water is thick and colored by the mud it has scraped from the banks. If you live in the city, you know that the water brought into your houses is apt to be muddy, showing that the river wears on its banks just as the waves do on the shore. Or, if you are near a brook, you will find, wherever there is a great rock or a heap of pebbles in its bed, a little layer of mud and sand which the water has brought there, and to which it adds every day. Water carries the soil that it digs and scoops from the land, as you might run with your hands full of parcels. But when the brook enters a lake, or the river an ocean, or it finds any obstacle to check its swift current, the mud falls to the bottom, as your parcels would be apt to drop from your hands if

you were suddenly stopped in your running. There at the bottom the soil spreads out in a thin layer or slice of mud, mixed with fine gravel, perhaps, or broken shells, as the case may be; and above this other layers are piled, sometimes into high banks, like those through which the Mississippi cuts its way, which still show the different colors of the many layers of which they are made.

So it is water that builds in layers or thin slices. And we must believe that the water-mark is on all those rocks in our old world book that have plainly been piled up in this manner, because we see water now building every where in precisely the same way.

But does water now hide shells and skeletons in what will ever become solid rock? Let the river Ganges answer that question. As it comes rushing down from the mountains it tears out, and takes whirling down with it, a tree perhaps. The tree is caught somewhere and held fast, and the great river leaves on it every day a little of the mud and sand that it brings down, as your brook does about its rocks and pebbles. The pile grows in the bed of the river. The water is cramped for room, and digs itself a way by tearing out its banks, leaving some of the mud thus scooped out on the little island. The air brings it the down of plants, and the water brings it seed. Reeds and long grass begin to grow upon it. More trees and branches are caught there; more mud and sand piled upon them; and as its thickets grow, tigers, deer, and buffalo come to lurk in them, and to dwell there.

But now comes a high spring-tide and a strong wind, forcing, you may say, the water back, and making the river overflow its banks. Houses and cattle are swept down in the flood; and if our little islands are not torn out by the roots, the raging water carries its inhabitants struggling down, and buries them in the ocean perhaps, or deep in mud and slime. Now the river is always building, and tearing down, and burying in this manner. And between these many additions and alterations it might happen that the men who live in the year five thousand, coming to the Delta of the Ganges, which is now a woody marsh, full of lions and tigers, might find instead firm ground covered with cities; and digging down to what is now mud and slime, would find rocks—new leaves added to our book of the earth—and breaking open these rocks, might discover, fast in them, the bones and skeletons of lions and tigers, which the river had buried in the slime thousands of years before, and which by that time might have disappeared from the earth, just as the wild-cat and the beaver are disappearing from our own country. Here, then, would be rocks telling the same story and made in the same way as those about which we are asking; and the river Ganges is busy building them to-day.

And for the pigmy cities piled up into rocks!—why, every where, water is a merchant, and its oceans are great markets, to which come

millions of tiny builders for lime and building material. I need not remind you of the coral insect, building up its reefs into islands. But in Bermuda are deep basins of water called lagoons. The bottom of these lagoons is covered with a thick, soft, white mud, which, when dried, can not be distinguished from chalk; which makes a large leaf in our old world book. And this soft white mud is entirely made of little shells—broken, deserted houses of little ocean-dwellers. Just such building, we must believe, went on in the old times; only in those days the water must almost have possessed the earth. For the Bible tells us “that the earth was without form and void, and that the Spirit of God moved on the face of the waters.” And in some of the lower leaves of our book there is no handwriting but that of water. Water, his mark, every where.

Under those dark and ancient seas, then, where now stand continents covered with cities, millions of little workers called Nummulites built the Pyrenees; for many of the mountains of that range are made entirely of their shells. So is the rock out of which was hewn that great pyramid which stands half choked in sand, under the rainless sky of Egypt. The cities built in this way under the waves are perched on some of the loftiest mountain peaks; and we should find the handwriting of the sea on the walls of many of our own houses and churches if we knew how to read it.

But if water builds, it builds like a child at play, to tear down again. Over and over again, on our leaves of rock, is written how water overflowed the land, and held it for years beneath its waves; and we see now, on every side, water perpetually wasting and destroying. All other things rest, but water never sleeps, never is tired. If you wake at midnight you will hear the waves grinding on the beach, or the brook roaring over its rocks, just as they have done, without once stopping, ever since the world began. And what is this worker who is never tired doing, do you think?

Why, eating at and wearing away the land!

The fingers of every little brook are busy pilfering mud and sand. The hands of the great Irrawaddy River seize on sixty-two feet of earth every *second* and carry it down to the sea. The Ganges in a few years has scooped out twenty-six thousand acres in one place. The Mississippi is raising the bottom of the sea. The ocean is beating down the coast and tearing out the heart of the rocks. The Shetland Isles are built up of hard porphyry rocks. But the Atlantic digs them out in caves, and scoops them out in arches, and wears the great bluffs thin and sharp, till the solid cliff is broken up in pointed towers, standing apart as if the hard porphyry were so much chalk and the waves were iron borers.

Again, on the old maps of Yorkshire, England, are set down the towns of Auburn and Hyde. But the waves have taken away the ground on which their houses stood, and there

are only sand-banks in their place. And there was Ravenspur, once a great sea-port, from which Edward Baliol sailed to invade Scotland! If on that day some one had told the men of Ravenspur “there will be no sign left of your town in the year 1869 except a wide sand-flat seen at low water,” how they would have stared at him! But the water has torn down its shore, and carried away its houses, and overflows Ravenspur and possesses it. Or you may have read of St. Michael’s Mount in Cornwall. It is a rock, washed on all sides by the hungry ocean. But its old Cornish name means the “Hoar Rock in the Woods.” And under its sands are rotting roots, and branches, and hazelnuts, that fell from trees that Cornish boys and girls used to watch, no doubt, as you do the chestnuts in nutting-time.

Now we know that God holds the earth in “the hollow of his hand.” And that when he called the waters together into seas he set bounds for them, and said to the ocean, “Thus far shalt thou come, and no further.” But we can see that God works with means that we may call machinery. He uses fire and air and water, gases, metals, and minerals. Indeed, what we call science is only finding out a very little of his wisdom, and our wisest men are only spelling out a little here and there in his wonderful book of the world, as you might make out a verse or two in some of your father’s volumes. So, when we see that water every where makes war on the land and conquers it, and that we should not have a foot of standing room left if something did not rebuild and uphold the earth, we ask, what holds it up? And when water ruled over the earth what raised the land above it, and lifted the sea-cities to the mountain peaks? And, finally, what in the beginning supplied Water, the builder and merchant, with material, and so in reality laid the foundation of the world?

To answer these questions I must tell you now of a great magician who changes every thing that he touches. He can turn a hard, white substance of no value into agates, opals, and jaspers; and a metal not worth so much as silver into sapphires and rubies. He can hide himself in a match, and can raise a whole chain of mountains in one night. He is in all your houses, and familiar to every one, and yet few people really know any thing about him, for he is continually called a devourer, when the fact is that he never devoured any thing in his life. And you will often hear him spoken of as a destroyer, though he is the greatest builder and manufacturer in the world.

This magician has a master who is a spirit of the air, and full of contradictions. He is so thin and colorless that he is invisible, and of such airy make that the very lightest gas will pass through his body. Yet he is so strong that you may squeeze him with a weight of twenty tons to the square inch and he will never feel it. He is of such a fierce and fiery nature that iron burns like tinder in his breath, and he goes

loaded with chains lest he should set the world on fire, of which he is quite capable! Yet this active, fiery spirit is always asleep! And no voice but his servant's voice can wake him. The name of this spirit is Oxygen; and the magician, his servant, is Fire.

Oxygen, as very likely you know, is a gas that makes about one-fifth of our air, four-fifths of every plant, one-half of the solid rocks, and eight-ninths of all water. I told you that it was always chained, because, though it is locked up so fast in plants, rocks, and water, and is so weighed down by gases and vapors in the air that we handle, and breathe, and drink it without harm, it is really the fire-element. Put a diamond or an iron spring in a jar of pure oxygen—that is, oxygen that has been freed from its chains—and it will burn like tinder. And I said that Fire devoured nothing, though you can see that it burns up whatever it touches, because burning is only a change of form.

Perhaps you are surprised at that; but let us see what really happens in the burning of a log of wood. And the better to do that, you must let me present you to two more wonder-workers, known as Carbon and Hydrogen.

In your mythologies you may have met one Proteus, who could wear what shape he chose. Carbon is the real Proteus. He is an invisible gas, floating in air. He is also a dweller in the water and in the rocks. He is the substance of coal and of the diamond, and you must thank him for all the books that have ever been printed, for he is at the bottom of all printers' ink. Carbon is also the soul of honor. What you confide to him he never gives up; and although he has so many forms, in one sense he is unchanging. Examine charcoal, even through the microscope, and you will find, although it has been red-hot, the most delicate rings and cells of the wood from which it has been taken unharmed. A sort of salamander, in the fiercest flame Carbon never melts. If it did, the coal would run out in liquid form from our grates and furnaces, and there would be an end of our fires. And though Carbon is on intimate terms with Water, and even lives in it, he has never yet given up a single letter on any printed page to dampness. The letters in a Bible printed four hundred years ago are as black as on the day they were printed. Nor will our friend Carbon yield to the sharper persuasion of any liquids like ether or alcohol, and dissolve in them. And we should be very much obliged to him for the care he takes of our printed records, for you can see how much mischief might be done if books could be so easily altered or defaced.

As for Hydrogen, he is one of the most subtle, penetrating, and airy of sprites. He can slip through paper or leaves of gold or silver. Direct a stream of this gas against one side of such a leaf, and you can set fire to it on the other. Give him a burning taper, and he will instantly blow it out. Let him meet Oxygen, and he strikes fire. And talking of Oxygen, he

is a partner with Hydrogen in all sorts of enterprises; and yet you often find Oxygen, though chained himself, acting as Hydrogen's jailer; and the only way of setting Hydrogen free is to offer his jailer something that he likes better. For instance, Hydrogen is obtained from water by forcing the water through an iron tube, filled with iron shavings, and red-hot. Heat rouses the sleeping Oxygen. He throws off his chains, seizes on the iron, and lets Hydrogen go free.

And now, I dare say, you are wondering what has become of the log of wood that we left behind us. Patience, little friends! Wood, oil, wax, and most other burning material, are made up chiefly of some oxygen and hydrogen and carbon. Now you bring fire to the wood. Fire calls on Oxygen, who on the instant is as lively as the ogre who scented the blood of an Englishman. He smells hydrogen. Carbon he likes, but hydrogen is better. Hydrogen, finding that Fire means to turn him out of the pores of the wood, seizes on a solid particle of Carbon, perhaps as a sort of heavy reserve, but in vain! Oxygen seizes on it, and they come together with a fury that strikes out a white heat. The Carbon, which you can imagine as innumerable little points of charcoal, goes free for a moment, but warmed by the white heat of the battle glows in what we call flame. Meantime Hydrogen is immortal, and Oxygen can not make an end of him; but he can change him into a watery vapor; a spirit of the mist! He does so; and Hydrogen, as fast as he is let loose, floats up the chimney in vapor of water. That done, Oxygen is ready for Carbon; pounces on him, and sends him also up chimney as carbonic acid—a colorless gas; and so on, in turn, till the burning is done.

Now you say the log is burned. The smoke, which is made of little particles of carbon not wholly consumed, has escaped. And there is only left a little ash on the hearth. But are you quite sure of that? Suppose, instead of allowing the smoke and vapors and gases to escape, they were caught and weighed with the ashes. What do you think would be the weight? About half that of the wood? No. Fire has only changed the wood; into very different shapes, it is true, but all its parts are there, and the weight will be greater than that of the log, because oxygen has been added to it. All burning is simply change. Remember that, and you will more easily understand how the destroying Fire is in reality a builder and manufacturer.

In examining our book of the earth we find water bringing lime to the sea-dwellers, who built it up in their cities. I have already told you how the Pyrenees, among many other mountains, were built under the ancient seas; and our own peninsula of Florida was raised almost wholly by the coral-builders, to whom the Mississippi brought lime from the lime deposits of the Western States. But water never makes lime. You find sandstone rock, brought together by running water, from grains of sand.

But water never manufactures sand. There are great beds of clay piled up by water; but where did it find the clay? And there are rocks, like granite, that were never built up in layers, and with which water has never meddled at all. What produced them? Here is a new handwriting, and we must look for a new worker.

If there were only one man in the country who knew how to manufacture a watch, when you saw a watch you would say at once that it was made by him. Just so we say that here is the work of Fire, because he is the only mineral-maker now. There is a metal called "calcium." It is very abundant (though always hidden in what are called its ores), and somewhat resembles lead. You remember that all burning is change. You must remember, also, that the change is not always into gases and vapors. Fire changes this yellowish white substance into lime—common quick-lime. There is another substance, called "silicon," also very abundant; and Fire changes this silicon into one of the hardest solids known, and makes out of it quartz, rock-crystal, agate, jasper, opal, and many other minerals; and their grains make sand. You know what a large proportion of lime there is in our book, and the different sorts of silica make up one-half of its leaves. There is a metal called "aluminum." It is brilliantly white, and in the fire sends out a vivid light. Out of this aluminum Fire brings sapphires and rubies. Emery is a rougher form of it. Unite now silica and aluminum and you get clay. There is another element called "potassium," so light that it will swim on water, and so fiercely eager for oxygen that it will break the bolts and bars that shut up oxygen in water and burst into flame. Fire turns potash, alumina, and silica into a mineral called feldspar, or into another named mica, according to the proportions in which you mix them. And now jumble quartz, feldspar, and mica together, and Fire will transform them into the different varieties of granite rock.

These, and many more changes that I have not time even to name, the chemist can compel Fire to work to-day. And though here is a very small specimen of Fire's manufactures presented to you, you can imagine that as the chemist calls his working-room his laboratory, so when God commanded Fire to lay the foundations of the earth, he made the world his laboratory. We can not tell how God created the metals and minerals, the gases and vapors, of which the earth is composed. But we must suppose, seeing how his servants Fire and Water work now on the earth, that he brought them together in a heat so great that solids like iron flowed liquid as water, and that the vast quantity of water now gathered into oceans floated as fine vapor. Fire to-day will bring you out of lumps of coal-light for your cities, beautiful dyes for your silks, that wax-like substance called paraffine, and the grimy coal-tar with which we pitch our roofs. What could not Fire have wrought then? Diamonds, sil-

ver, gold, opals, rock-stuff, the granite ribs and foundations of the world, whatever the wisdom of God foresaw that we needed. But in these days Fire and Water work together, from the building of our fires to the turning of every wheel and the dragging of every railroad train in the land. And if we are correct in our world-making it seems likely that Fire and Water worked together then also. If this burning mass revolved among the planets, as the earth does now, after a time it would begin to cool. The atmosphere around our earth is a sort of blanket which prevents us from losing all our heat. Beyond this there is nothing like what we call air in the spaces between the planets. Heat there would be lost in space, and the cold must be greater than any thing we can conceive.

Chilled, then, by this cold, the water would in time draw together in drops and fall in rain. And though the glowing earth might at first send it back in steam, you can see, as the earth cooled more and more, the waters would prevail more and more, till the ocean finally covered the whole great furnace, where Fire had been manufacturing on such a monstrous scale. And then would commence the work of Fire, and Water, and gigantic disturbances, to the signs of which we are come in our book.

The leaves of which we have been talking are arranged one above the other in very nearly the same order all over the world—in some places laid out smoothly, in others wrinkled and bent as if some monstrous hand had suddenly crumpled them together and shut the book. In some places they are in waves; in others the lower leaves are pushed quite through the upper ones. There are great forests buried under slime and shells of the sea. Sea bottoms and rocks laid by Fire on the very foundations of the world raised on the tops of the highest mountains. You recollect that these leaves are layers of solid rock that cover hundreds and thousands of miles. To have been so crumpled and bent the earth must have been shaken and torn. To have been raised and lowered whole countries must have been lifted from the waves, and other countries must have sunk below them; and I dare say that seems to you impossible. But let us see if any thing of the sort is being done in our day.

It is difficult to believe that the firm earth's surface should be altered, or that such a mass as a mountain can be raised suddenly and at once; but in one night the coast of Chili, and of course the Andes with it, was raised from two to four feet! (What do you think of the power which could lift the Andes four feet?) And the fishermen thought that the ocean had retired, because acres of flat land that was always under water was now laid bare, covered with dead shell-fish, and beds of dead mussels were found ten feet above high-water-mark. In the interior the whole country was raised from five to seven feet, as much land as the half of France being thus moved upward in one night.

In one of the Canary Islands, in the year 1730, the earth split open suddenly, and a great hill was thrown up in one night. A stream of lava followed, and a monstrous rock, thrown up with a noise like thunder. The disturbance thus commenced lasted five years. A high hill was thrown up and fell back, and from three new openings poured out sand, ashes, and horrible vapors which suffocated the cattle. The lava poured out into the sea with a dreadful roar, so that the water was covered with dead and dying fish, and a new island was formed, and the flourishing town of St. Catalina was buried under hills four hundred feet in height.

In Java there was a mountain covered with trees and vines. All about it were fertile plains and swarming villages, not in the least afraid of their neighbor the mountain, for the oldest man among them had never heard that it was a volcano. But in July, in the year 1822, suddenly streamed up from it columns of hot water, boiling mud, burning brimstone, and ashes. The rivers were choked with hot water and mud, and overflowed, carrying away people and cattle. Streams of bluish mud overflowed the villages; the whole face of the mountain was changed; two rivers were turned out of their course; and new hills and valleys were formed. Four thousand people and one hundred and fourteen villages were destroyed.

Here are three accounts, which I have taken almost at random from the long and dreadful list of earthquakes. In them you have a whole range of mountains and a considerable country raised in one night; hills made, valleys opened, rivers turned aside; men and cattle buried in mud, in which now their bones might be found; layers of ashes, lava, and sand laid over a fertile country of fields and vineyards; rocks made by Fire deep in the earth thrown up; islands formed, and cities buried under great hills; and the work of change continuing for years—all the work of three earthquakes, by no means the most remarkable that have occurred. In these disturbances the land was raised; but in many other earthquakes towns and large tracts of land have suddenly disappeared, and been replaced by water. In a violent earthquake in the Delta of the Indus the eastern channel of that river, which had been fordable, was deepened so much that there was eighteen feet of water at low-water. The fort and village of Sindree sank in the water to the tops of the houses, while about five miles away rose up suddenly out of a level plain a mound of clay, filled with shells, which they called the Mound of God. Then again in Jamaica, in 1692, the ground swelled and rolled like the sea, and bursting open in awful cracks, people sank through, and were caught in the middle or by the head as the earth closed again. The store-houses on the harbor side sunk, and afterward their roofs could be seen from boats which sailed over them. One thousand acres of land about the town went down, and the sea rolled in; and in the north of the island plantations

disappeared under lakes, which, on drying up, left nothing but sand and gravel. Here are but five examples, all told, out of many hundreds; but I think you can begin to understand how it is that men find forests under the dried beds of seas and lakes, and the bones of fishes on mountain-peaks.

I think it is as difficult to believe also that the earth is raised or lowered gradually, and without any help from earthquake or volcano; perhaps more difficult. Yet such is actually the case in many places. For instance:

Near Puzzuoli, in the year 1750, there was discovered, almost hidden under bushes and soil, a splendid temple, supposed to have been built in honor of Jupiter. The pavement was still preserved, and it was supported by forty-six columns. These columns were cut from a single block of marble, and were forty-two feet high; and on these columns was written a wonderful story. It said that this temple, which of course had been built by men on the land, and which now stood twenty-three feet above the level of the sea, had also at one time been sunk below the waves. This story was written over about nine feet of each column, and the letters were small pear-shaped holes, which a shell-fish, called the *lithodomus*, had bored for itself. In these holes were also many little shells, such as are commonly found in the holes of the *lithodomi*, and it was plain that the temple had remained some time under water; for as the *lithodomus* grows larger it enlarges its house. The temple had been lowered under the sea and raised again, if you are to believe the little sea-workers on the columns. But this is not all. An artist named Nicolini used to visit the temple in 1807, and remain there all day to sketch; and at that time the pavement was never overflowed except when the south wind blew violently. But coming back there, sixteen years later, he found the pavement overflowed by the tide twice a day, and caught fish where in calm weather there never was a drop of water. Since the beginning of our century the ground on which the temple stood had been lowered two feet.

On the other hand, the country of Sweden and Norway is rising, and the story is told as plainly as the story on the columns of the temple of Jupiter. All along the coast is a thick fringe of many rocky islands. Between these islands and the main land boats and little vessels make their voyages; and as the channels wind in and out among these rocks, you will see that the stout old sailors must know by heart every rock and turn to voyage in safety. Now these channels and islands are constantly changing. Rocks which were only seen through the clear water are now bare. What were dangerous, sunken reefs are only half covered at high tide; and these rocks grow in height and breadth. What was only a smooth, round hump grows into a ledge, thick with sea-fowl. The ledge stretches into an island, with a few mosses and blades of grass, and from that it grows into a plain cov-

ered with fir-trees—all within the memory of men who are living now. Artificial marks prove also that the land is rising or the sea is lowering, whichever way you choose to put it.

If you ask me how this is being done, I can only tell you what we believe and suppose. The old Greeks had a story of a lame god called Vulcan, who was a blacksmith. They said that his forge was underground, and that the volcanoes were his chimneys. In the same way we imagine that our great worker, Fire, has his work-shop in the centre of the earth. We think so because we find that at a certain distance underground the heat is always the same summer and winter; and, digging below that, that it increases at a wonderful rate: one degree of heat, I think, for every sixty or seventy feet. If this increase of heat goes on it must be so hot at the centre of the earth that the hardest rock and minerals would melt. This, then, would be the work-shop of Fire, and ready at his hand are, as we know, metals, minerals, gases, and large bodies of water, scalding hot, or turned into steam, all packed down under the enormous weight of rock and soil above. You remember how the land is worn away in some places, and how the bed of the sea is piled up in others. If now you had a round ball, and its covering in some places was very much thicker than in others, the thin places after a time would be apt to crack, would they not? That is what seems to happen on the earth. There is a crack in its crust. The land goes down on the heavy side, and up on the light side; and just as water oozes up through a crack in thin ice, the gases and steam burst up, only with a terrible explosion, tearing out rocks, and forcing up through the volcanoes showers of melted earthy matter, sand, and ashes; and, terrible as are often the consequences, you can see that Fire and the earthquake are yet necessary to rebuild the land, and hold it up out of reach of the devouring water.

Here I must tell you good-by. But remember. We have not read the Book of the World—only spelled out a few chapters in its primer.

WILLIAM BRADFORD'S LOVE LIFE.

I.—ALICE CARPENTER.

“**A**LICE, will you give me your answer? I have traveled many leagues and run no little risk to ask this question.”

“And after all may get no answer at all,” interposed Alice Carpenter, pouting her pretty lips, and glancing mutinously into the grave face bent toward her.

“Nay, child, be not froward, nor trifle with what is or should be solemn earnest to both of us. I have already told you that this is the only hour I can call mine own while we remain in England. It is true, I accepted the mission with the full intention of seeing you while here; but, having accepted, I must fulfill it, and to-

night's sunset should see me far on the road to London.”

“Why wait for sunset, Master Bradford? If your London business is so pressing I marvel that you should delay it for the sake of a silly maiden, who in truth knows not her own mind as yet.”

And the spoiled little beauty turned to chase the tiny greyhound who leaped in sport upon her.

William Bradford stood moodily watching the game of play which followed, and making for himself, all unconsciously, a picture of the scene never to be forgotten amidst all the vicissitudes of a stormy life.

It was the garden of an old English manor-house dating from the reign of Elizabeth—a date proven no less by the formal architecture of the latter than the quaint ordering of the former, with its yew-trees sedulously clipped in shape of towers and ships, falcons, peacocks, and rampant lions; with its great beds of roses, cultivated not only for their beauty, but as material for conserves, rose-water, and scent-jars; trailing honey-suckles and sweet-brier ran riot among clumps of heart's-ease, garden lilies, love-lies-bleeding, prince's feather, marigolds, and hollyhocks. The northern limit of the garden, near which William Bradford stood, was defined by a high wall built of the same hard, red bricks as the house, and upon the southern face of this was nailed a long range of espalier fruit—black-heart cherries, peaches, pears, and great golden plums, celebrated throughout the country for their size and flavor. They were ripe just now, and the hot sun brought out a musky odor from their rich clusters, filling the air, and mingling forever in William Bradford's memory with the hum of the bees, the ringing laughter of the girl, and the glowing crimson of the roses at his feet.

Many and many a day, in the dark years that were to come, that garden bloomed and ripened, those rich scents filled the air, and the hum of bees and peals of laughter filled his ears, among the black solitudes of the New England forests, or the cold desolation of the rock-bound coast; and yet, looking upon the scene to-day, he saw it not, heeded it not—thought only of the merry girl, who, suddenly deserting her playmate, stood beside him, and mockingly exclaimed: “What! not gone yet, Master Bradford! Truly the elders of your church did ill to intrust their mission to such a dreamer and laggard as yourself.”

But her jesting drew no responsive smile to the face of the young man, as, laying a hand lightly upon her arm, he gravely answered:

“You have had your jest, fair Mistress Alice, and you have taken your time. Now I will pray you to give me a serious answer to my most serious petition. Will you be my wife, and fare with me to Holland, or it may be farther still—for our people are minded to remove to some country over seas where shall be room for all and opportunity for all to thrive by hon-

est labor? It is no life of luxury, no certain prospect of any sort, that I can offer, Alice; and yet I dare to urge you, for I know that the great love I bear toward you, and the earnest will that I find growing within my heart, will give me power to make you happy, and shield you from all suffering but such as God appoints. Alice, will you be my wife?"

For a moment the girl stood with downcast eyes and blushing cheeks, her answer trembling upon her smiling lips, and shining from beneath her drooping lids. The lover read it, and suddenly clasped her to his breast.

"Yes, sweet one, you confess it at last—you confess it even without a word; and thus I take the answer you have been so long in giving."

He pressed his lips upon her own, but hardly had tasted their honey when he was startled by a smart blow upon the cheek, while Alice, tearing herself from his embrace, cried, angrily:

"Not so fast, good Sir. I never have said that I would even give you any answer, and here you pretend to read it in my face, and proceed to take it unspoken from my lips. I'll give you no answer at all to-night, no, nor to-morrow morning either unless the humor takes me to do so."

"Then, Alice, you will never give it," replied the young man, not angrily but resolutely. "When that sun, now lost in the fir-tops, sinks behind the horizon, I shall say good-by; what comes between now and then it is for you to decide. The petulant blow and the froward words I forgive, but farther trifling with an honest heart and a man's life I shall find it hard to pass over. Your answer, Alice."

"I have told you once, fair Sir, that I have no answer for you before to-morrow morning. I have a will as well as you, and if you do not care enough for me to abide my pleasure, why, good-by, good Master Bradford."

"Good-by, Alice, since you so will it, and yet, I pray you, pause once more. This is no idle play, Alice, but saddest earnest. I solemnly assure you that I must be gone at sunset, and I can not leave London again before we return to Leyden. If you are my betrothed your father will bring you to me, and we will be married—"

"Again not so fast, good master," interposed Alice. "Suppose I refuse to be brought to you in London. Suppose I demand a longer wooing and somewhat more ceremony in my wedding? And, in good sooth, I fancy that your style is altogether too masterful for me already. I know not what might chance if you were indeed my lord, so I think I will say you nay—for to-night at least; it may be that in the morning I shall have changed my mind, but now—fare you well, Sir."

"And fare you well, Alice. I have your answer, and I have told you more than once that I can wait for no other. And yet—Alice, I shall be three days longer in London—if you will come to me, you and your father—"

"Marry come up! I go after you to Lon-

don, saying, 'Kind Sir, will you of your goodness take me to wife?' A long day it will be before I do that, Master Bradford, a very, very long day."

And half in anger, half in mockery, she flung the handful of roses that she held full into the grave face of him whom she addressed, and ran, light and swift as a fawn, up the path toward the house.

One of the roses lodged upon the young man's folded arms, and, smiling bitterly, he caught it, looked for a moment into its glowing heart, then put it inside his doublet.

"A fair ensample of her love—as sweet, as short-lived, and as thorny," muttered he; and leaving the garden by the postern gate, he mounted the sturdy horse awaiting him in the green lane beyond, and rode away just as the sinking sun touched the horizon.

"He will come to-morrow," whispered Alice Carpenter, watching the sunset, and listening to the horse's retreating feet, while her bright cheek grew pale and her eyes filled with tears.

But the morrow came, and brought neither lover nor message, and still another and another morrow, until a grave friend of her father's, down from London for a day, set the girl's mind at rest by mentioning that the deputies from the dissenting folk at Leyden had returned thither, having met but ill success in their attempt to obtain a patent from the Virginia Company.

"Fool! Fool! Fool!" muttered Alice between her set teeth, as she stormed up and down the garden path, where now the rose-petals lay a-dying. "Fool that I was, and more fool that he was, not to know that a maiden's no-say does not always mean blank no! And yet I care not; who shall say that I care overmuch?"

In this mood her father found her, and placing her hand within his arm restrained her hurrying steps to his own pace, while he said:

"Daughter Alice, I have received a proposition of marriage for you from a worthy gentleman, not as I think quite disagreeable to you. Indeed it is the son of our friend within there."

"Master Southworth!" exclaimed Alice.

"Yes. His son Edward asks your hand, dear child. What is your answer?"

"Yes."

The father turned in some surprise, and looked into his daughter's face. It was white and rigid almost as death.

"My daughter, there is no need for such instant consent unless you are quite sure of your own mind. I had thought that Master Bradford—"

"Do not mention that person, if it please you, Sir. I like Edward Southworth passing well. He is a brave gentleman, and a courteous, and, please you, dear father, go and tell your friend that I say yes, and excuse me for to-night. Good-e'en, father."

"Good-e'en, little maid; and yet, wait one moment before you run away. It is but right

that you should know that I have nearly settled my mind to sell all that I have, and cast in my fortunes with our brethren in Holland. It was for that I went to London so often in the last month, while worshipful Elder Brewster and his associates were there. If I do this, and you wed with Edward Southworth, who abides in London, we must be parted, my little girl—we two who have never been parted yet.”

“Oh, father!” and Alice, clinging about her father’s neck, wept piteously; wept for the approaching separation, and wept for the death of her young love-dream, and yet never wavered in her desperate determination.

“Oh, father, father!” sobbed she, and then—“but you will have my sister Mary left, and I could never abide in Holland.”

“It will not be like this, truly;” and the man looked round upon the pleasant garden where he had played in childhood, where he had wooed his sweet young wife, where he had wandered seeking comfort for her early death, and where he had thought to watch his own day draw to its close.

“Not like this, but ‘Whoso loveth house or lands better than me’—it is daily borne in upon my mind that I must go, Alice; and for myself I grudge not the sacrifice; nor for Mary, who is but a child; but if you shrink from the toil and privation, or if your conscience does not bid you go, sweet one, here is an opening for honorable escape. What say you?”

“I will never go to Holland, father. And if Edward Southworth cares to marry me, he may.”

She was gone, and her father, looking after her in wonder and some doubt, could only say,

“What man so wise as to read a woman’s heart! But yet it was consent, and as such I must repeat it.”

Six months later Thomas Carpenter, with his daughter Mary, arrived at Leyden, and among his first guests was William Bradford, who, with pale lips, and a high-throbbing heart, inquired of him for news of his daughter Alice.

“Alice? She wedded with Edward Southworth the morning that I sailed from Southampton,” replied the father, carelessly, for already he had forgotten a dim suspicion formed by the strange manner of the girl at the time of her betrothal, and Bradford had never opened his mind to him.

II.—DOROTHY MAY.

From the house of Father Robinson, the pastor of the struggling community at Leyden, and with whom Master Carpenter was at present lodged, William Bradford returned to his own abode in a family of the name of May. In the little parlor sat a young girl spinning flax upon a small wheel, who at his entrance glanced up, blushing brightly.

“So soon returned, William!” said she, shyly. “Did not you find your friends?”

“Yes—and no,” replied the young man, tossing his hat upon the table, and throwing him-

self upon the high-backed settle beside the fire.

“‘Yes and no!’ You speak in riddles, friend,” said the girl, her bright color fading as quickly as it had come. “Have you ill news from home?”

“No, Dorothy, no ill news; no news at all to a man who knows what women are; only tidings that one whom I thought mine own has given herself to another man, and, I dare to say, were the whole truth known, cares naught for either of us.”

And as he spoke he folded his arms upon the end of the settle, and bowed his face upon them, careless whether she who watched perceived the emotion he could no longer conceal.

A few moments passed in utter silence, and then a light foot crossed the floor, a hesitating hand was laid upon his head, and a girlish form sank upon its knees beside him.

“William, dear William!” said Dorothy May’s soft voice; “all women are not like that.”

“What care I whether they be or not?” And the young man ground something worse than a sob between his clenched teeth.

Another pause, and then again the timid voice:

“Nay, William, do not scorn all because one is false, for that is neither just nor kind to yourself.”

“I do not scorn you, Dorothy. You are good and kind, and will, I doubt not, some day be true to the man who wins your love; but she—”

“Indeed I would be true, did the man I love love me,” sighed the girl, her head sinking so low as to hide the glowing color of her cheeks.

William Bradford listened; took counsel of his own heart; nay, then, of his wounded pride and love, if you will have the truth; then sat upright and placed a hand beneath the chin of that rosy face, raising it to a level with his own.

“And you love a man who loves not you, fair Mistress Dorothy?” asked he at length.

“To my shame be it spoken.”

“Nay, to the honor of thy tender, humble heart. And wouldst thou wed that man, knowing that he had loved another woman passing well, and that the wound was not wholly healed?”

“I would wed him, and try to heal the wound with my own love,” whispered the girl.

“Dorothy, am I that man?”

“None other.”

“And thou wilt be my wife?”

“A true and loving one, so surely as God gives me strength and life.”

“So be it.” And again the young man raised the blushing face and kissed the trembling lips. It was a strange betrothal—a most unwise one—for human love is at best but a feeble staff to support one over life’s rough places; and, weakened as this was, ah, who could not have foreseen the end?

But Dorothy May’s widowed mother saw only comfort and satisfaction in the gaining a hus-

band for her child, of so well-esteemed a character and so fair worldly prospects, not to mention the setting at rest a suspicion which had for some time haunted the good dame's mind, connecting Dorothy's pale cheeks, lagging step, and tearful eyes with William Bradford's attention or neglect.

So all was arranged without difficulty on the one side or the other; and the second letter that Master Carpenter sent home to his daughter Alice announced the marriage of her "sometime playmate, William Bradford, to a very worthy and also comely young woman, Dorothy May by name."

III.—MISTRESS ALICE SOUTHWORTH.

When Mistress Southworth read this letter in the dim, vast chamber of her new home in "Duks Place, near Heneage House," she uttered a little cry, and with one of the impulsive movements of her girlhood flung it into the fire blazing at her feet. Then she covered her face and sobbed for a few moments wildly, passionately; and at last she rose, and slowly pacing the long vaulted chamber, took counsel with her own heart, until at last, coming back to the fire-place, she stood there a pretty picture, with the ruddy light striking up upon her fair young face, disheveled golden curls, and whitest throat and arms, left bare by the fashion of the rich "padusoy" robe which fell trailing upon the oaken floor.

As fair a picture, and but little older than that of the girl who, half in jest and half in wrath, had pelted her lover with roses in the quaint walled garden of the manor-house six months before, and yet—

The crisp cinder of the burned letter had fallen out from the fire and lay upon one of the painted tiles of the wide hearth. Smiling bitterly Alice Southworth stirred it with the toe of her satin shoe—it crumbled beneath the touch, and, caught by one of the draughts eddying through the room, flew in a cloud of black flakes up the chimney and was gone.

"So best—so best! Smoke and ashes, and the last trace blown to the four winds!—So let it be."

And thus unconsciously echoing the words in which William Bradford had sealed his betrothal, Alice Southworth closed, as she thought forever, the sweetest chapter in her book of life, and turned to the new duties and new ties she had voluntarily if rashly assumed.

IV.—PILGRIMS.

"And you will sail with these others in the *Mayflower*, Master Bradford?" said Elder Carpenter, glancing keenly at the young man, who sat looking gloomily from the latticed window of the little Dutch ale-house, where they had met for noontide refreshment.

"Yes, I have so resolved," replied he, moodily.

"And your wife and the little one?"

"They will remain behind—I think."

"Does the dame consent to be so deserted?"

"We have not yet spoken of it. She can remain with her mother, and come to me afterward," said the younger man, hesitatingly; and Elder Carpenter again glanced keenly into his perturbed face.

"It is a grievous burden to my spirit," said he, after a pause, "that I am denied this means of testifying to my faith. Were it only mine own infirmities and inconvenience that stood in the road I would count it naught, though I perished by the way; but I must not burden you younger men with the charge of one who can at best serve but little purpose in the life you enter upon, and would most likely become a serious charge and trial. Nor can I bear to abide here longer, or to lay my bones in foreign soil. My night approaches, and I will get me to mine own land and sleep where my fathers sleep."

"You will return into England?" asked Bradford, in some surprise.

"Yes. This ship has brought me letters from my daughter, Mistress Southworth. She has met with heavy affliction in the loss of her good husband; and she prays me very earnestly to return to her, I and my daughter Mary, and abide beneath her roof to the end of my days."

"Master Edward Southworth dead!" echoed Bradford, blankly.

"The Lord has willed it so," replied the elder, reverently.

"And Alice a widow!"

"The widowed mother of two little children. Truly she needs a father's counsel and assistance," mused the old man, and, lost in reverie, he did not perceive that with his last words William Bradford had left the room.

Deep in that evening's twilight, as Dorothy sat hushing her child to sleep with the murmured cadence of a hymn, some one entered the room and laid two hands upon her shoulders from behind.

"Is it you, William?" asked the young mother, softly.

"Yes, wife. I shall sail with the first party of adventurers in the *Mayflower*. Will you go with me?"

"Why, this is something more than sudden!" exclaimed Dorothy, trying to turn her face toward her husband, who resisted the attempt, and only repeated:

"Will you go with me, wife?"

"Where you go I will go, you know full well," was the meek response. "But why have you not told me your will before, that I might have made preparation?"

"I did not know it myself; and I thought that if I went you and the child would abide a while with our good mother here. But if you will go, Dorothy, it will be a singular favor to me."

And now the wife would not be restrained, but rising hastily, confronted her husband with looks of undisguised amazement.

"A singular favor to you!" repeated she. "Why, what words are these from you to me, William? Am I not your own true and loving wife, no less bound to obey your lightest wish than anxious to lay down my life, if so I might please you? Why, had you waited until our friends were embarking at Delft Haven and then said to me, Up and follow them! do you think I would have faltered? And had you tried to go without me, William, I would have thrown myself at your feet and wept and prayed and importuned until you gave consent to my accompanying you. Dear husband, what have I done amiss that you should have entertained this cruel thought of leaving me?"

She was weeping now, and clinging about his neck, so that she could not see the ashen face and haggard eyes he bowed above her, as, gently removing those clinging arms, he said:

"Naught amiss, naught amiss, Dorothy! You have ever been as you promised to be, a true, faithful, and most loving wife. Mine is all the blame, mine should be the punishment."

"What blame? what punishment? What do your words mean, dear William? And what makes you look so wan and distraught? Have you bad news from England?—they told me that a ship was arrived with letters—"

"Peace, woman, peace! The wife should not too curiously pry into her husband's will, but accept it unquestioned, for is he not her head and law?"

And, with a laugh of bitterest self-contempt, William Bradford left the room and the house.

The next day, when Dorothy, his wife, went abroad to consult her gossips about the needful preparation for the voyage and the new life before her, and heard the news of Edward Southworth's death, she clasped her hands of a sudden above her heart, and cried out as if in sharpest pain.

"Dear child, what is it?—what ails you?" exclaimed her friend, running to her.

"Nothing, nothing! A sudden pang—I know not what—as if one's heart broke; but hearts do not break in sober truth, do they?"

"No, not so suddenly as that, nor yet without a cause, and we all know you have none, Mistress Dorothy," said the other, sharply eying the pallid face and trembling form of the young woman.

"Not when I am leaving my mother and my little child, and may never see either again?" asked Dorothy, bursting into tears, and making her escape.

And that day she began to die.

V.—DOROTHY BRADFORD'S JOURNAL.

In the month of August, 1620, the *Mayflower* sailed from Delft Haven for England, and some weeks later from thence for—God alone knew where.

Let him who would know what human courage and human fortitude, combined with a high faith and confidence almost more than human, are capable of, let him read the record of that voyage, as told in Bradford's own simple and

earnest record, so self-forgetful and so unconscious of its own importance that the only fault of the history is that it omits all notice of the historian, except in the vaguest allusion.

Had not other papers remained—some precious letters, and a few leaves of a private diary in the faint and timid manuscript of a woman—this story had never been written, or had been based upon mere imaginings, instead of saddest and most undoubted fact.

Let us here transcribe one of these fragmentary leaves, literally, except for the modernizing of some obsolete phrases, and the supplying of some words illegible from time and wear:

At last, praise be to God! we lie within sight of land, but what a land! Stern rocks, with cruel waves forever dashing upon them, black forests sheltering who knows what fearful creatures, and still more fearful salvages; snow, ice, desolation at every hand; no houses, no Christian people, no sign of the work of man; I had almost said no sign of the work of God. Such is our new home; and yet we have no choice but to accept it, for the captain says and swears that he can carry us no farther, and unless we settle where we will establish ourselves without more delay, he will put us ashore at the nearest point.

William, with Master Carver, Miles Standish, and some others, has gone ashore in one of the ship's boats, to discover, if they may, what sort of place lies over against us at this present. I trust they will not elect to settle just here, for surely no place can be worse, if as bad. And yet I know not why I should care. All the earth hereabout will be too sternly frozen to give me room. I wonder how they would go about to dig a grave—pity to give them so much pains, when this cold, bitter sea washing past my cabin window would bury me in a moment—a little moment.

Ah, God forgive me! what wild and wicked thoughts are these. Away! away! Get thee behind me, Satan! Last night I dreamed that my mother came to me with my baby dead in her arms—my baby, my one child. Ah! child, you never loved another better than me, and yet I left you—for him. When I woke startled from my dream, he stirred in his sleep, and murmured: "Alice! Sweetest, dearest!"

That was all, for I laid my hand upon his lips, and he kissed it, and so slept again. Ah, did he know it was my hand he kissed, or did he still dream? They do not dream when they are dead, I think. I hope not, surely, for I would not be haunted with that dead baby, nor yet with his father, whispering in his sleep: "Alice! Sweetest, dearest!"

Dec. 7.—Well, they did not pitch upon that spot where we lay when I last wrote, and now we are moved farther into a great bay or gulf, and lie again at anchor, while the men, with Master Bradford among them, are away exploring anew. They found before some baskets with corn in them, and some signs of rude cabins, where it is supposed the salvages or Indjins lived, though now they are gone. But it is weary work noting these things down, and in sooth I have small heart for even thinking of them. Last night I dreamed again of my baby, and he wore wings and stretched his little arms to me. I would I knew if he be indeed in heaven. I wonder if I could win there if I took my life in mine own hand, and so went begging entrance. William speaks no more of Alice, either waking or sleeping, and in good sooth he speaks but little to me in any fashion. One might think he was afraid of me, he shrinks so from my presence, and yet I never reproached him, oh, never, never! How could I, when my whole heart has wasted itself in vain love and longing toward him? Yes, I think that is why I must die; my life has wasted itself like a little brook I once saw at home that came leaping down from the hill-side, and falling upon a sandy plain was swallowed up, and perished, in spite of all its struggles. Poor brook! Poor Dorothy! I wonder will he be sorry when I am dead. Ah, how

the cold bitter sea runs past these windows! I will up to the deck, and climb over in the chains as I did yesterday, and look down at the water. Perchance—God forgive me, God forgive me the awful thought, and yet—

That is the last, the very last, of the worn and faded manuscript. Join it to what follows.

In the journal of William Bradford, after a long and minute account of the perils and adventures of the exploring party who finally selected the site of the present town of Plymouth, Massachusetts, as their point of debarkation, occurs the brief statement that, upon their return to the ship, it was discovered that Dorothy Bradford had fallen overboard and was drowned.

Only that.

VI.—WILLIAM BRADFORD AND ALICE SOUTHWORTH.

Almost two years later Mistress Southworth, fatherless as well as husbandless, received a letter of which but one torn fragment remains. Let us add it to our story:

God he knows, I never wished her death, or failed in the dismal effort to feign a love I never felt. How ill I succeeded you shall see, for I send you certain writings in the fashion of a Diary, discovered in one of her coffers some time after her most untimely end. No eyes but mine have seen them.

And now, Mistress Southworth, nay, I will say as I have said many a fair time before, now, sweet Alice, I ask you once again, as I asked you long since, and I think you will remember, as I do, the fair, well-ordered garden, with its bourgeon of bloom and its rich scents of fruit and flowers, and the humming of the bees about the ripened plums, I ask you once again the question that I asked you then and there, and once again I beg you for such answer as truthful woman should give to honest wooer—will you have me to your husband? And yet, Alice, as I write, the scales fall from mine eyes, and I see as I have not before that I am asking far more of you now than I asked then. I have been the husband of another woman; my worldly estate is mean and impoverished, notwithstanding the title of Governor which my brothers and co-workers here have bestowed upon me since the death of the noble Carver; and the life which I ask you to share is one of labor and self-forgetfulness.

But yet, Alice, I dare to ask you, for within my own heart I carry an assurance of such undying love and respect toward you, that it meseems to outvalue all other things, and if it were possible that you could find in your own breast a similar assurance, I think, Mistress, that not your garden, whose bloom and scent lie so fairly in my memory, were a sweeter abode than these rugged rocks and melancholy forests, so we two might be together.

In conclusion, I must say that although I have discoursed at large upon this matter to you, and although much pains and many qualms of doubt have gone to the composition of this letter, I find by reviewing it that I have said nothing of what is in my heart, and have worded my petitions so coldly and so awkwardly that I hardly dare hope you will approve them; but yet, Alice, I remember me of a time long since when I thought—yet let that pass, and believe that whether you say me yea, or nay, I shall ever be while life endures,

Your faithful friend and humble servitor,
WILLIAM BRADFORD.

Stitched to this fragment of a letter is another, a mere scrap written in the cramped, delicate, and almost illegible hand of a woman, and superscribed

To the Worshipful Governor of the Plymouth Colony in Massachusetts Bay, these:

FAIR SIR,—You do remember my father's garden with its roses and its wall-fruit so well that I marvel you should have forgotten the last words ever spoken to you in that garden by me, or rather, the marvel is that I should remember them myself; and yet I do. I told you then, Master Bradford, nay, pardon me—I would have writ, Right Worshipful Governor Bradford—I told you then, that it should be a long day and a very long day before you should see Alice Carpenter following you to London and offering herself to you for wife; and now you ask me to come, not to London, but across seas to the strange New World where you abide, and all with the self-same purpose. Truly, Sir, I marvel at your hardihood, and again I marvel more at my own sudden lowliness of heart which does not resent as I would have it this arrogance of yours. Wait until I summon Pride, and ask her counsel. "Give him the old answer," quoth she, and so, Sir, you have my reply. Yet softly, here speaks another voice; methinks it is that of Common-Sense. "How fared it with yourself after you gave him that scoffing answer five years ago?" And again: "Mind you, the long day that you promised him has passed, and it is not Alice Carpenter who goes to seek him but Alice Southworth."

So sit I, listening to my counselors, uncertain which to credit as the true one, and so, unable to determine the bent of my own mind, I close these lines, and remain, fair Sir, your good wisher and old friend,

ALICE CARPENTER SOUTHWORTH.

Post Scriptum.—I omitted to mention in the body of my letter that I am resolved upon emigration, and have taken passage in the ship *Anne*, bound from Southampton to your Colony, for myself, my two children, and my sister Mary, whom you will perhaps remember, and perhaps also may elect to the place in your affections once held by my unworthy self. At all rates, however, we shall have the time and opportunity for considering face to face these matters, so largely and yet so uncertainly spoken of in our letters.

VII.—THE END.

No tradition, no memento tells us how the Governor of Plymouth Colony received this letter of his former love—this proof that time and distance and sorrow had cured her neither of her audacious coquetry nor her affection for himself; but this much we do know, that when the *Anne* arrived in Plymouth Harbor, in the last days of July, 1623, that it brought as passengers Mistress Southworth, her two boys, and her sister Mary, who many years after is set down as "a godly old maid who never married."

Two weeks after the arrival of the *Anne* Alice Southworth and William Bradford became man and wife, and here is the double note of the event made in the Governor's journal by his own hand and hers:

This day Alice Carpenter hath answered the question I asked of her six years ago among the roses of her father's garden in Lincolnshire, and she hath answered yea, as she should have answered then.

And below, this note:

This day, the 15th day of August, shall hereafter be known as the long day; for it is the one promised by that same Alice Carpenter as the day whereon she would wed with William Bradford, whom God forever bless and hold in His holy keeping.

What more do we know? Only that they lived to a ripe old age, and departed, he some years the first, leaving sons and daughters to inherit their name, and perchance their qualities.

Editor's Easy Chair.

AT the close of a stormy March day of this year two soldiers were crossing from Newport to Fort Adams in a sail-boat managed by an inexperienced lad. When they were partly across a blast suddenly struck the craft; the boy was confounded, the boat capsized, and for half an hour, clinging to the keel, the hapless men and boy struggled with the waves. Then the hold of the boy relaxed, and he sank; but a boat had put off from the Lime Rock Light-house, about half a mile away, and before the men were exhausted it had reached them, and they were saved. The persons who saved them were Ida Lewis and her brother Hosea, children of the keeper of the light.

Ten years ago in the same harbor four young fellows were upset in a boat, and the same girl hastened in her skiff to rescue them. A little later three drunken soldiers stove a hole in their boat not far from the light. Two swam ashore, the third was saved by Ida Lewis when nearly exhausted. Two years ago some men were driving a sheep upon the wharf in Newport. The animal plunged into the water, and three men running along the shore in pursuit at length found a skiff and put out into the harbor. A heavy sou'wester was blowing, and the skiff was swamped. Once more Ida Lewis pushed off for them, and bringing them safe to shore, returned and landed the sheep. In the next winter a scape-grace stole a sail-boat from the wharf and made off. But the gale drove it upon the little Lime Rock, a mile from the light; and the thief clung to the mast from midnight until morning, when Ida Lewis saw him, and rowing to his relief, found him, as she said, "shaking and God-blessing me, and praying to be set on shore."

This is a girl in her twenty-eighth year, slender, blue-eyed, with light brown hair, frank and hearty, and likely to be more famous next summer than any Newport belle. Let us pray that she may save herself from the storm of notoriety and flattery as she has saved so many lives from the sea. Or, still better, as she is betrothed, let us hope that she may be safely married, and with a changed name have left the Lime Rock Light-house before Mrs. Grundy reaches Newport.

But the heroic story of which these are the incidents suggests some very improving reflections upon the sphere of woman. No one can read the report in the newspapers, no one certainly read the brief telegraphic notice upon the following morning, without a thrill of admiration and sympathy. But are we to understand that such emotion was natural and proper? Are we to believe that it is "feminine" for young women to row boats in storms? Is it "womanly" to tug and strain through a tempest, and then pull half-drowned men into a skiff? Is not the Heavenly appointed "sphere of woman" the nursery? and is there not very grave apprehension of the "female sex" disappearing altogether if such conduct is approved? The brother Hosea, in the first instance related, was in his place, undoubtedly. He was a stout youth, and it was an occasion that demanded brawn and

vigor and skill. But, my dear Sir Piercie, would you wish to have seen your sister, et cætera, et cætera?

There was the inevitable Grace Darling also, who in the early dawn, thirty years ago, rowed with her father from Longstone Light, and at the risk of her own life saved the lives of nine persons from the wreck of the *Forfarshire* steamer. Then there was Mrs. Patten, who steered the wrecked ship to port. There were Molly Stark, Joan of Arc—where will these things stop? What is to become of the sex, and womanliness and feminineness, and all other pleasing qualities, if general applause shall be unguardedly lavished upon conduct which, if our sisters, et cætera, et cætera?

Dear Sir Piercie, what an intolerable deal of nonsense is talked and written and sung and, above all, preached about women, and their sphere, and what is feminine, and what isn't—as if we men necessarily knew all about it! The other evening the Easy Chair heard something which sounded so familiar that it might have said it itself; and it was in this vein. Here comes a man and says, "Isn't it curious that it is the nature of melted lead always to run into bullets?" And while I am wondering I observe that he has a bullet-mould in his pocket, into which he pours the fluid metal. Or another bland gentleman remarks: "How beautifully Providence ordains that pear-trees shall grow like vines!" And he takes me into his garden and shows me a tortured tree trained upon an espalier. These worthy philosophers might as wisely inform us that Providence beautifully ordains saints to be chops and steaks, and then point us to St. Lawrence upon his gridiron. What determines the sphere of any morally responsible being? Perfect freedom of choice and liberty of development. Take those away and you have taken away the possibility of determining the sphere.

Now, speaking soberly, no man will be such an—let us say donkey, as to insist that it was unfeminine in Ida Lewis to pull off in her boat to save men from drowning. It was no more unfeminine than to sing a babe to sleep. And if this be so, then it was perfectly womanly to learn the use of oars—to acquire the means of doing so great a service to her fellow-creatures, a service which touches the heart and the imagination, and, as in the instance of Grace Darling, will become a poetic tradition.

When we have come as far as this there is certainly no need of asking whether such actions fall within the sphere of women, or whether they are competent to row boats. Ida Lewis has shown that she can row to some purpose, can row indeed to such purpose that every generous heart applauds. This seems to settle the whole vexatious question about women. Indeed there is really no more question about women than about men. And unless the whole debate upon the subject of the rights of men, which has shaken society now for so many years, and often to such tremendous results, is folly, that upon the rights of women can hardly be smiled away.

The original impediment is the apparent difficulty of persons who are otherwise intelligent to understand what they are talking about when they begin to discuss the proper sphere of womanly activity and interest. Some few weeks ago, for instance, there was a meeting at the end of the winter term of the Female Medical College under the immediate charge of Dr. Elizabeth and Dr. Emily Blackwell, with Dr. Willard Parker and other eminent surgeons and medical men in the faculty. The object of this college is to give to women just as profound and thorough a medical education as any man can receive, and it was hoped that the meeting might tend to direct public attention and sympathy to the subject. There was an admirable address by Dr. Emily Blackwell upon the history of the intention and progress and condition of the college, and a speech to the students by one of the faculty, and two or three speeches by Dr. Parker and others upon the general subject of the professional study of medicine and surgery by women.

One of the speakers took the ground that what was really wanted was an opportunity to prove by experiment whether such an institution were desirable; and necessarily he stated that the question was not whether women were competent to become efficient and skillful physicians and surgeons, but whether they should be allowed the same liberty of choice and freedom of development which men claimed for themselves. That many women might fail was very possible, as certainly a great many men failed; but it was the perfection of owlish folly to begin by a theory of the sphere of women, or a guess or a prejudice as to their capacity.

To thinking persons this was undoubtedly a sufficiently trite and obvious statement, but it really goes to the root of the matter. Dr. Johnson advised his friend to try to divest his mind of cant, and what people usually need in approaching the consideration of such a question is to divest their minds of theory. Even some very accomplished and trained scientific men find it very difficult to observe scientifically—that is, with a sole regard to the fact, and not to the possible suggestion or use of the fact. If we wish, therefore, to know whether women are competent to do this or that, we must do as we do with men, allow them perfect freedom of choice and opportunity.

Now imagine a person listening to such a strain of remark, for the obviousness of which perhaps the orator should have blushed, and then gravely writing to a newspaper that the orator's remarks were nothing but stale rhetoric about liberty and rights and some supposed hostility to women—without the slightest allusion to the only important point, namely, whether women are competent to be good physicians and surgeons. Here you see is a worthy person who has not even a tolerably remote idea of the ludicrous position in which he places himself. "It is not," says the orator, "the business of men to theorize about the competency of women to do this or that, because competency can not be abstractly determined, especially by traditionally prejudiced minds—the business of men is to allow the utmost freedom of choice, not to hamper it with doubts and wonders and surmises and suspicions. Give women every opportunity of education that

men have, and if the maternal instinct of a woman is not strong enough to overbear her fondness for a quadratic equation—to paraphrase Sydney Smith's witticism—let the maternal instinct in that woman go. It certainly is not the duty of men to keep women ignorant in order that they may continue to be women." And no sooner does the luckless speaker take his seat than the worthy person who has been gravely listening shakes his head and exclaims, "Tut, tut! mere froth of words! Why doesn't this gentleman leave his various faces and tell us whether women are competent to be doctors?"

To answer this question in the briefest terms—"Because nobody but women themselves can tell us, and they will never have the chance to tell us if we undertake to decide for them in advance."

This view seems to include all the aspects of the question. There really is no occasion for the horror which some good people express, as if a woman who thinks she is quite as capable of voting for a school trustee for her children as her gardener, who lately came from Tipperary, is therefore a kind of moral monster—a woman trying to unsex or de-womanize herself. She may or she may not wish to do it, as is the case with men. But that the idea should seem repulsive or strange can only excite a pleasant smile upon the part of any body whose mind has ever seriously moved upon the subject. Mr. Hoar, a Representative in Congress from Massachusetts, recently said before a committee of the Legislature of that State that he had known in Concord a woman fitted by her accomplishments to fill any chair in Harvard College, and every one who knew her knew that she was equally competent to every duty in her household. Now this lady, so far as the Easy Chair knows, never asked nor wished to vote for school trustees or for any other office.

Such women are known to every body—not, indeed, of the accomplishments of the lady to whom Mr. Hoar referred, because her attainments were unusual, whether among men or women. But there are plenty of women every where who in general judgment are superior to men. All that is or can be asked is that they enjoy the same opportunities as men, without any theory of their competence or incompetency. Possibly the worthy but uncomfortable listener who was waiting to hear whether certain men supposed that women can be learned and skillful doctors will, upon further reflection, perceive that he was waiting for a very ridiculous thing. Suppose that Dr. Parker had said, "I don't believe that woman ought to study medicine, or will ever attain any skill in the practice," would the worthy listener have retired from the pretty little theatre with the conviction that Dr. Parker's opinion settled the matter? Would he not, being a just and reasonable person, have instantly answered, "I don't want Dr. Parker's theory upon the subject. I want the women themselves to prove it."

The very point upon which the most intelligent women insist is that men shall not interpose their opinions and prejudices as the laws of nature. They insist that the form of the vine shall not be considered the type of the pear-tree merely because men think it pretty and convenient to train it upon an espalier. The worthy listener complains that somebody did not say whether he

thought the tree naturally grew in that form. No, he did not. Somebody said that if you wish to know the natural form of a pear-tree you must leave it to show for itself.

THE Easy Chair has the pleasure of commending to the attention of its friends a remarkably sensible letter which it has received upon a subject which is very interesting to all writers and readers. The Easy Chair omits the first part of the letter because it is, if not flattering, certainly complimentary. And the writer evidently thinks so also, for he says: "The man who is at once hunter, trapper, gardener, and mechanic, and who can support a family of five on less than \$300 per annum, need not flatter any Chair, even in the White House."

"I like your patience," says the friendly correspondent, "with the formidable army of literary aspirants. Can any body but a publisher realize what a clamorous host of them is arrayed against their natural enemies, the editors? Just as the March Number of *Harper* came to hand, and I had indulged a quiet laugh over 'Imperator' and 'Artaxerxes,' there came to hand also a little poem which the Messrs. Putnam 'declined to use.' The only point worthy of notice in this was a mark in pencil on the margin, signifying the number of my manuscript, 1616!"

"I rolled on my bear-skin and laughed for fifteen minutes by the clock at the rich and subtle humor of the thing. Then I got out the pipe, and had a reflective smoke while making a little calculation.

"Sixteen hundred and sixteen—probably more—articles submitted in one month! Now the leading monthlies publish about, say a score of articles each month. Of these about twelve will be furnished by the editorial corps and the trained, scholarly men of letters, whose services are bespoken. Of the remaining eight four at least will be written by authors of name and ability, leaving four to be chosen from—let us be reasonable—four hundred *well-written* manuscripts, with at least an equal number that are most undeniable Balaam. It is clear that the editor *must* hurt the feelings of seven hundred and ninety odd literary unfortunates by returned manuscript!"

"If the Drawer ever got up a richer thing than that I want to give a prime otter-skin for the Number in which it is printed. I never sent an article to *Harper*; if I ever do, and it be returned, I give you my word I shall feel no rabid desire to shoot the editor or break the legs of an unoffending Easy Chair.

"There is a cogent reason for this senseless flooding of editorial tables with undesirable literature. Young America won't work at any species of honest, productive handicraft, or on a farm—not if he can help it.

"'Do something, be Somebody,' yells a chorus of writers, backed by all the male and female relatives of that modest young man. And it is distinctly to be understood, that to work at any sort of productive labor is to be nothing and nobody.

"In view of the fact that every dollar of national wealth must come directly from productive industry, this state of things is very encouraging. I have a goodly number of neighbors who have among them a large number of boys; and not

one of these is learning, or has any notion of learning, a trade, or engaging in farm labor. They are to be lawyers, doctors, etc., and it really puzzles one to tell who is to raise the bread and do the needful work of the next generation. One in ten of these lads may succeed in living respectably without labor. Some of the others will try literature, and have their feelings hurt by rejected manuscript. It seems as though the real work of the nation were to be shirked to the shoulders of the hewers and drawers who flock to our shores from across the Atlantic. They, with the passive stolidity engendered by generations of oppression and suppression, accept almost any thing that will give bread, and they are also the only class who dare, or at least who do, raise large families. If they make the population and do the nation's work for the next fifty years, who will have the power and the pay? And about how large a percentage of vice, ignorance, and stupidity can we afford to absorb yearly for the sake of getting ready-made laborers to enrich corporations and capitalists?

"And if ten millions of the worst of our population were at once eliminated, how much worse off should we be as a nation—would we not have more real strength in the twenty millions left? And would it be loss or gain in the end?

"Respectfully yours."

Nothing could be truer than these words from the frontier, and yet to how few persons does the truth occur? The gentle reader sees at once what Bearskin might have done when his verses were returned. He could have lain quietly in ambush until the next Number of the Magazine appeared, and then, eagerly surveying the poetry which it contained, could have asked, with a scornful laugh, whether the Editor called *that* poetry? Or, more calmly, he might have asked the public its opinion of a person who preferred the published "Ode to a Creaking Dog-cart" compared with the rejected "Lines upon a late lamented Bull-frog."

Bearskin seems at least capable of doing one thing which an impartial Easy Chair—and not an Editor, although the postman does not pay the least attention to incessant denial, and insists upon daily delivering to the Easy Chair communications intended solely for the Editor)—which an impartial Easy Chair has long wished to see done. If the frontiersman had really thought his offering what most of us suppose our performances to be, he would certainly have printed them side by side in a newspaper, even if he had to pay for their insertion, and demanded upon the two the verdict of mankind. Why has that never been done? Why do not some of the declined-with-thanks put the matter to this kind of test? They may be sure that if they would, and if their judgment were sustained by the public, it would be of very great service to the editorial body, and the public would instantly demand the prompt appearance of that long-projected monthly periodical, "*The Remainder Biscuit: a Monthly Issue of Declined Literature.*"

Indeed, the project has been very seriously entertained, and one of those pleasant congresses to settle a name has been called and held hilarious session. But no name was so generally satisfactory as the *Biscuit*. "The Left," "Leavings: a Monthly Overplus," "Emptings," "Lees: a

Last Resort," "The Strained: an Occasional Collection," "The Anti-Colander," "The Monthly Uncurrent," "The Fool's Paradise," "The Nine Days Limbo," "The D.: a Troop of Ghosts," etc., etc., were all suggested, and their pertinence, upon due explanation, allowed; but nothing was really satisfactory; and the whole subject has been referred to the Sassafras Club, with power.

Yet if the experience of authors could be known, it would probably appear that very few articles are accepted by one editor which have been declined by another of a similar publication—except for personal reasons or upon other grounds than mere difference of judgment as to the popular taste. Besides, a great deal that is returned is precisely for the reason that Bearskin suggests, namely, that there is not space. Why will not the kind friends believe it whose natural hope seems to be turned back upon itself whenever a poem or an article returns? If, indeed, your little contribution were like a sudden, important public event to an illustrated paper, like the fall of a cathedral, a shipwreck, an earthquake, a murder—if it were something that must, of necessity, be used, then indeed you need not think further of "Lees."

But the Easy Chair will not affect a want of sympathy that it does not feel. It heartily congratulates Bearskin upon his good-humor, and sincerely hopes that we may all share it.

It is certainly a sorry fact that a proper ambition can sometimes only be gratified by a little sacrifice of self-respect. The spectacle of the month or six weeks after the inauguration of a President is very sure to illustrate this truth. You, for instance, who read these lines know very well that you are the individual who ought to be sent to Crim Tartary as Envoy Extraordinary and Minister Plenipotentiary. You are peculiarly fitted for it by nature and training, and your patriotic political devotion, wholly forgetful of Talleyrand's *point de zèle*, seem to signalize you as one naturally to be intrusted with that mission. Now a very grave question arises: Because you, who certainly ought to know your own aptitudes and qualifications and services and claims and desires better than any body else, happen to be yourself, is your testimony worthless? Ought you, by abstaining from alluding to your eminent fitness, to connive at depriving your country of the invaluable service of somebody who might be named? In a world where there is so determined a tendency upon the part of every body else to think that they also are the very proper persons for the place to which your eminent qualifications plainly point, how hopeless to expect them to remember yours, and to press them in the right quarter! What remains then, unless you would deliberately see your country deprived of such services as you could render—what remains but for you to go forward, and to send in your card to your Senator, and to say to him in confidence that, etc., etc., etc.?

But is that a pleasant thing to do? However profound may be your conviction upon the subject, is it a fine thing to urge yourself for a conspicuous or lucrative public position? The Easy Chair knew Leontes—who knew him not?—and he wished to serve his country in a post fitted to his powers. "You," said considerate and per-

ceptive friends, before the early days of March—"you will, of course, be called into the public service." So thought Leontes, but held his peace. As the early days of March drew near he heard less of his inevitable fate. And when every body, penetrated with a sense of his own fitness, quite forgot that of Leontes, and hastened by night and by day to Washington, Leontes said, "If I don't look out for myself, who will look out for me?" and sped with the rest to Washington.

Have you been there at that time, and do you know the scene? Have you conceived the rancor, the jealousy, the slander, the black lies? There is one maxim every where urged and every where practiced. It is that which Leontes repeated to himself. It is substantially: "Nobody is your friend. Look out for Alpha, or he will turn into Omega under your very eyes!" What does that imply? That you must constantly present yourself to those who, as you know, are weary of seeing you. That you must virtually blow your own trumpet loudly. That you must pay a heavier price than the article is worth.

"Well," said Leontes, "what will you do? If I had not pressed my own case this agreeable office that I hold would have been given to somebody else who pressed his, and you might have had Caliban here instead of your humble servant. Must we not cut our coat according to the cloth? If we live in a time and country where this is the way in which this matter is arranged, shall we be transcendental, and tumble into the well while we stare at the stars? It will not do to be too fine and too modest in public life. Why should you and I see an unworthy man slip into a good place because we are too retiring to push for it? Doesn't the public service need the best men, I should like to know? Ought it not to have them? Have I a right to indulge my bashfulness at the expense of the state? Is it not plainly an Epicurean selfishness to prefer the gratification of my diffidence to the general welfare? Is it not a kind of moral treason, and is not treason of all kinds criminal? Suppose that I yield to this weakness which would persuade me that I ought not to use the ordinary and only method of obtaining an office for which I am conscious of my peculiar qualifications; suppose that in consequence I see it slide into less competent hands; suppose, in still farther consequence, that its less competent administration by diminishing the public revenues increases the public debt and the taxes; suppose that the consequently increased or the unrelieved taxes press heavily upon Gurth—so heavily that he succumbs, loses his wits, and, after cutting the throats of his wife and seven small children, throws himself into the river—how can I plead my wretched disinclination as an excuse for not preventing such a melancholy tragedy? And how many such tragedies might there not be if all the good men should say that they would not enter into the scramble for office? Don't you see," said Leontes, with great solemnity, "that it is a man's conscientious duty, if he wants an office, to take the usual means to obtain it? If he sits at home nourishing himself upon his private theory of his fitness and of his claims, he will not be disturbed at the banquet by any summons elsewhere. No, no; step into Cherry Street, and then say what is the use of transcendental behavior."

To this tremendous oration of Leontes the

Easy Chair could think of no better reply than the words of poor old Cardinal Wolsey, who was certainly tolerably familiar with the Cherry Street of his time, and who was in no danger of tumbling into pits from too much star-gazing. If ever there were a man who knew the usual methods, and who was sternly resolved not to yield to the weakness of non-conformity, it was the old Cardinal, and he could only say:

"Love thyself last.....
Corruption wins not more than honesty."

'Tis curiously like the transcendental Hamlet:

"This above all—to thine own self be true,
And it must follow, as the night the day,
Thou canst not then be false to any man."

The argument of Leontes is not new, but it was not the argument of John Pym, nor of John Hampden, while it was that of Charles the Second and of Robert Walpole. There was a familiar illustration of it at Albany, and the temptation to the illustration is perennial. When a certain Legislature, renowned for its moral austerity, assembled in that city, certain gentlemen followed with bags of money. Those bags were so many eggs to a certain personage whom we will call Samuel Hen, because his shrewd mind instantly, as it were, brooded over them, and hatched them to his own purposes. Mr. Hen said that here was a large amount of money. It was intended, he was very sorry to think, to affect legislation. It was hopeless to attempt to divert it from that purpose. Now, since that money was certainly to be spent, why should it not help his side as well as the other? There was an election imminent, and there would naturally be great expenses; and as the objects which the money was intended to aid were not in themselves immoral, Mr. Hen usually agreed to be responsible for a certain number of votes if he received a certain share of the money. "This stream," he was wont to say, "is flowing down hill. I think it a great pity that it should have escaped from the reservoir; but my regrets don't stop it, and it may as well turn my mill as my neighbor's." This was a signal instance of avoiding transcendentalism in politics. This was cutting the coat according to the cloth. This was not the indulgence of an Epicurean selfishness in the gratification of diffidence.

Leontes would perhaps have satisfied the Easy Chair more readily if he had been less vehement and prolix in his own justification, and if he had seemed wholly satisfied with himself. But the more solemn he grew the less sure he seemed. It appeared to occur to him that the plea that you must take the ordinary method to obtain a result, without looking into the character of the method, was very like the argument that the end justifies the means, and painfully like the plea for conformity in every thing and every where.

THE Easy Chair has received a most energetic and piteous protest upon a subject which falls strictly within the domain of the minor morals and manners to which its reflections are theoretically limited—very minor morals and manners indeed. But what do we mean by minor morals? It is a very patronizing and condescending term. We read in the lectures and essays upon our Literature that Addison and Steele and the other essayists wrote charming little effusions

upon the minor morals, until the imagination is full of curl-papers and tea-parties and "tells," and the most hopeless zanies look down loftily upon the delightful wits as if they were mere frivolous *coiffeurs* in literature. What do we mean by the minor morals and this smile of superiority?

Is honesty, truth-telling, sincerity, one of the minor morals? Temperance, frugality, neatness, do they fall under that head? If the Easy Chair should preach a short sermon—as it is perfectly capable of doing—upon punctuality, would it be enforcing a minor moral? Is abstinence from murder and arson and forgery regard for the greater morals? Do you remember the story of the boy who was intrusted with a few shillings belonging to his father, and who, being faint with hunger, spent fourpence for some food, and was haunted and harassed by the gloomy consciousness of a great crime, until he fell upon his knees and confessed to the awful parent, who replied, tenderly, "My son, why didn't you spend a pound?" And then you have read of the enormous frauds of rich bankers in London—in London, you observe, and which it is remarkable, as Mrs. Gamp might suggest, that there are no rich in New York. Or let us reflect upon the French story of the rich man who stole the poor man's ass, which was the poor man's all, but worth only an insignificant number of francs; and upon the disappearance of the diamond necklace. Was the theft of the ass a minor immorality, and that of the necklace a major? Or a man throws his wife out of a three-story window, and no bones are broken, and she walks safe and sound into the house; while a mother tearfully punishing her child induces a fit from which the child never recovers—how do we strike the balance of minor and major?

But surely—here interposes an impatient and clear-sighted reader—surely you do not pretend that to talk about the prettiest way of flirting a fan is to do any thing but prate of the most minor manners? No, certainly not. But shall we not read all the famous sermons of the renowned divines without finding any more touching and eloquent and impressive lesson upon the transitory character of human life than the "Vision of Mirza," or the "Reflections in Westminster Abbey?" No, dear and clear-sighted reader, it is not the pulpit that makes the sermon. It is not the surplice and the bands and the mitre and the crozier—"these but the trappings and the suits" of preaching. Nor is it the subject: it is the method, that is the important point. If Addison discoursed of the hearty, homely honesty of Sir Roger de Coverley, and in an unclean age shows the beauty of a decent and honorable life, Bishop Burnet or the Reverend Dean of St. Patrick's can do no more, although they may perform in ruffles and in a church.

No morals are minor. Cleanliness, says the proverb, is next to godliness. The proverb lacks something—for there can be no true godliness without cleanliness. In our better faith vermin can not consort with saints, whatever may be the case in Arabia. What was that book of Mrs. Opie's that we all used to read? Mrs. Opie was one of the most famous women in England, and she wrote "Illustrations of Lying;" in which, amidst a great deal of interesting and

exciting incident, the great truth was enforced that a white lie is as bad as a black one. Indeed, truth was represented as a very narrow but very firm highway across a quagmire, and the fatal morass was as deep and as hopeless immediately at the edge of the highway as it was a mile off. To leave the road in the least was like falling from a wharf into a river. There were no descending shallows—no minor morals deepening gradually out to the major.

And so of manners. They are determined by the spirit, not by the act. A clumsy, shy boy, who offers a girl a rose-bud, and is redder in doing it than the flower, is essentially more gentle and refined than the courtly and elegant Lovelace blowing a kiss to the same maiden. It is real respect for her which makes the boy so shy, it is the secret want of it which emboldens the man. And in Addison and his brethren it was the gay and gracious manner in which they treated their subjects that make them the minor preachers, for their subject was really the proper conduct of life, and what other text had the Bishops?

"Small service is true service while it lasts,
Of all thy friends tho' humble scorn not one,
The daisy by the shadow that it casts
Protects the lingering dewdrop from the sun."

Now what can an Easy Chair say for such a preface to the modest little note of which it spoke, and which concerns only the cutting of leaves in a magazine? Yet if the smallest of pebbles causeth thy brother to offend—? The correspondent complains that precious time is lost in cutting open the leaves in this or any magazine, and that it is quite unworthy a publisher to compute how much money he saves by not cutting. Probably he saves none, and the gentle correspondent will remark as a matter of fact that the Magazine can be bought with cut leaves—the Easy Chair intends no joke upon the excellent illustrated articles—while those with the uncut are for the many who feel that with the cutting much of the external charm is shorn away. Does the good correspondent think that the pleasure of a new book or periodical can be thoroughly tasted if the leaves are not to be cut?

Editor's Book Table.

TRAVELS.

IF the reader will open any common school Atlas and look at the Map of the Eastern Hemisphere, he will observe that between the peninsula of Southern Asia and Australia lie a group of islands—a chain, in truth, which connects Australia with the main land. These islands, the largest and the most luxuriant in the world, constitute the Malay Archipelago. Rich in productions which commerce values, rich also in peculiar life which science investigates with avidity, these islands have, nevertheless, constituted until very recently almost a *terra incognita*.

In 1854 Mr. Alfred Russel Wallace left England to explore this region. Eight years he spent among these islands, observing the manners and customs of their inhabitants, and the physical formation and characteristics of the land, but chiefly in studying their zoology and in collecting specimens. In pursuit of his favorite science he traveled in the Archipelago, in sixty or seventy separate journeys, some 14,000 miles. He returned home with over 125,000 specimens of natural history. He has since spent six years in arranging them and digesting his notes of observation taken at the time. The fruit of this labor is given to the American public through Messrs. Harper and Brothers in a volume* of over six hundred pages, profusely illustrated with more than fifty engravings, including photographic likenesses of some of the most remarkable specimens of birds and insects from his cabinet. Ten maps accompany and enrich the book. It is rarely in these days of professional book-making that a man can be found who has the leisure, the means, and the patience for fourteen years of continuous, persistent, and concentrated study. It is rarely,

therefore, that it is our privilege to welcome a book of such peculiar merit as Mr. Wallace's *Malay Archipelago*.

Mr. Wallace is not an ordinary traveler. He has not gone to catch, in a momentary glance, the salient features of the people and their life, and to describe, with a few brief touches, what any one else might have seen as well in his place; nor yet to paint with gorgeous imaginative coloring the resplendent vegetation and teeming life of these islands of the tropics, whose shores are washed by a tepid sea, and whose hill-sides are bathed with the warmth and radiance of an equatorial sun. He is a scientist. Scientific exploration is with him an enthusiasm. A new zoological specimen is his great delight. He has gone to these islands as a student. Camping among the woods; pushing his canoe through its lazy and overgrown bayous; wading in the water nearly to his arm-pits to get a shot at a monkey; skinning it on the top of a stump because his Malay companions refuse to take it into the boat; accompanied for the most part only by Malay and Papuan guides; a lad sixteen years of age his only English companion at any time; penetrating often into wilds where probably no Anglo-Saxon explorer had been before him—he has achieved his successes only by persistent painstaking and self-denying labors. The number of specimens he has gathered tells at once the story of his research and its results.

In the outset he discloses to us the fact that these seemingly contiguous islands are, if judged by zoological standards, farther apart than Africa and South America. Let the reader draw a line through the Archipelago, leaving Borneo and Java on the west, Celebes and New Guinea on the east. The difference in life between the islands on the easterly and westerly sides of this line are far greater than those between Europe and Asia, or than those between Asia and America. This line passes at one point between isl-

* The Malay Archipelago: the Land of the Orang-Utan, and the Bird of Paradise. A Narrative of Travel, with Studies of Man and Nature. By ALFRED RUSSEL WALLACE. New York: Harper and Brothers.

ands only fifteen miles asunder. In the channel are intermediate islets; yet zoologically they are in opposite hemispheres. The western or Asiatic group of islands possess the animals which are found upon the main land. The eastern or Australian group possess none of them. In the one "the forests abound in monkeys of many kinds, wild-cats, deer, civets, and otters; and numerous varieties of squirrels are constantly met with. In the latter none of these occur; but the prehensile-tailed cuscus is almost the only terrestrial mammal seen, except wild pigs, which are found in all the islands, and deer. The birds which are most abundant in the western islands are woodpeckers, barbets, trogons, fruit-thrushes, and leaf-thrushes: they are seen daily, and form the great ornithological features of the country. In the eastern islands these are absolutely unknown—honey-suckers and small lorises being the most common birds; so that the naturalist feels himself in a new world, and can hardly realize that he has passed from the one region to the other in a few days without ever being out of sight of land."

On these facts the author propounds the hypothesis which further geological investigation may confirm, modify, or overthrow. This is, that Australia is the remnant of a continent which existed in past ages in the Pacific Ocean; that volcanic action has thrown up islands reaching westward from Australia, and eastward from India, until at last these two lands have met, as it were, in mid-ocean; and that the children of each continent possess still the peculiar life which characterizes the father-land. The division of races certainly lends confirmation to this theory. On the one group are the Papuans—dark-skinned, curly-haired, with the virtues and the vices of a certain rude and untamable energy of character. On the other the Malays—olive-colored, straight-haired, smooth-faced, with the virtues and the vices which belong to indolence and impassiveness.

Mr. Wallace very wisely follows a geographical rather than a chronological order in his book, which is less a volume of travels than a valuable contribution to science. He divides the Archipelago into five distinct groups of islands, and treats of them in five separate sections. In each section he gives first an account of his personal experiences, adventures, and observations in the group of which he is treating, and closes with a chapter devoted to a discussion of its natural history. His book is thus not wanting in that interest which belongs to romantic adventure in a comparatively unknown country. At the same time it possesses in addition peculiar interest to those who have felt the fascination which belongs to zoological investigations, since it treats of a land many of whose animals are to be found nowhere else. The Orang-Utan is never seen, as a native, off the islands of Sumatra and Borneo; nor the Bird of Paradise except in New Guinea and its contiguous isles; while of birds, butterflies, moths, and beetles, the pictures in this volume give us a tantalizing hint, which makes us anxious to see for ourselves the collection made at such pains and expense from which they are taken. We almost envy Mr. Wallace his eight years' wandering. We thank him cordially for his endeavor to enable others to enjoy his advantages without practicing his self-denial.

And we congratulate him heartily on his success.

SIMULTANEOUSLY in this country and in London is published Bayard Taylor's eleventh and last volume of travels.* To the many readers of his previous works the most interesting portion of the book will be the bit of autobiography which introduces it. It is interesting, too, as a curious illustration of the fact that men rarely mould themselves or choose their paths in life. To the public Bayard Taylor is a traveler who possesses the rare faculty of seeing what things are worthy of being seen, and the still rarer faculty of closing his mind, if not his eye, to things indifferent. His pen is not an eloquent one. He rarely attempts a lofty flight; when he does, you are rather painfully impressed that his wings are clipped. But he possesses what is worth more to one who travels for others' sake—the power of describing in common language the common scenes of strange lands so that his readers see them. His reputation is as a traveler. Ever since his boyhood he has been, we were going to say on the wing; we should rather say on the feet. The few years he spent at home he was almost unknown except as a lecturer, and his lectures, like his books, were simple accounts of what he had seen. The novels which he wrote formed neither a permanent nor a valuable addition to literature, and we are not aware that he has contributed any thing else, except now as the correspondent, now as the assistant editor of the *Tribune*, and occasional articles for the magazines. There is no place where a man is so keenly scanned and his capabilities so severely tested as in the editorial rooms of the New York press; and the New York *Tribune*, overriding his wishes, sent him forth as a foreign correspondent, first in California, afterward in China and Japan. But Mr. Taylor, who is known chiefly and properly as a "great American traveler," declares of himself that this title "has always touched me with a sense of humiliation." He tells us that he has never loved travel for its own sake, but that it has always been subordinate in his own mind to mental culture. His ambition, he intimates, is literature. He hints at a book on man and nature—"a human cosmos which should represent the race in its grand divisions, its relation to soil and climate, its varieties of mental and moral development, and its social, political, and spiritual phenomena, with the complex causes from whence they spring." This is all very well. But a public man must be judged by his works, not his aspirations. And Mr. Taylor must be content to wear the mantle of a traveler until he has woven for himself some other garment.

It is hardly necessary for us to add that he wears that mantle gracefully. As a tourist, without claim to scientific research, with no theories to maintain or to explode, but with the simple story of his travels to be told, we know no one in American literature at all his equal. He gathers facts. It probably will remain for other men to throw into the furnace the material which he and men like him have mined, and smelting it recast it in scientific forms. The *By-Ways*

* *By-Ways of Europe*. By BAYARD TAYLOR. New York: G. P. Putnam and Son.

of *Europe* comprises a series of articles, most of which, we believe, have been published before, upon places out of the common route of common tourists. It has been composed at different times; it follows no chronological order. It consists of a series of separate and independent papers, which are, however, none the less interesting because they are not continuous. It is a refreshing relief to the books of European travel penned by men who have walked only in paths beaten into fine dust by Americans; stopped at hotels thronged wholly by Americans; seen in Europe only what every American tourist sees, but who have finally yielded to the solicitation of urgent and over-indulgent friends, and who have therefore palmed off upon an unsuspecting public a volume made up of their journal, their correspondence, and their guide-books, and which contains nothing which has not appeared in almost the same forms a hundred times before.

BIOGRAPHY.

FELIX MENDELSSOHN-BARTHOLDY* was more than a great musician; he was a great man. There are sufficient indications in his life and character to justify the assertion that he probably might have excelled in literature or painting almost as much as he did in his chosen profession. His moral qualities balanced the intellectual and æsthetic. He was good as well as great. His life was stained by none of those vices which seem to belong to the migratory life he led. Full of the buoyancy of animal spirits he was never accused of being a trifler or an idle spendthrift of time. The most serious fault critics ever found with him was an occasional manifestation of impatience; but that a good musician should submit with patience to bad music would be an anomaly indeed. His domestic relations were tender and pure. His affection for his friends was earnest and enduring. His religious sentiments were throughout his life his master. The finest music he ever wrote was at their dictation. Indeed, all his music was the utterance of feelings which could express themselves in no other way so well. There is a beautiful picture in Elise Polko's *Reminiscences* of Mendelssohn's describing the romantic legend of Fingal's Cave on the piano to the loved ones at home. They asked for the story. "The legend can not be described," he replied, "by commonplace words, and you know that I am no poet; so I will play it over to you, and then you can tell me afterward whether you saw and understood it all thoroughly." Therewith he sat down and played to enchanted auditors that wondrous legend since known as the "Overture to the Hebrides." He possessed that peculiar attractiveness which in men of genius sways all who come into their presence. The better he was known the more he was beloved, and his kindly reassuring words have really made more than one singer whose future was dependent on his judgment. It was this peculiar magnetic power which made him the most powerful and the most successful orchestral leader of Europe, and enabled him, while yet young and unknown, to take in hand old and experienced orchestras,

skeptical of their youthful leader, and, in a single evening, assert a mastery which thereafter none ever ventured to dispute. Though never a public speaker he had all the elements of a successful orator. The short and simple speeches which were occasionally called from him in his professional career always captivated his audiences. It is a curious fact that his first speech was on the occasion of a musical testimonial to Jenny Lind, in Leipzig. Her star was just then rising. At the torch-light serenade which was offered to her, the spacious court-yard of the mansion where she was a temporary guest was entirely filled. Perplexed by the homage paid to her, which seems to have been a perpetually recurring surprise to the sweet singer throughout her career, Jenny Lind yielded to Mendelssohn's advice to go down and express her thanks to them. "I will go to them, but you must accompany me and speak for me," said she. Nothing certainly could be better than his speech on this occasion. "Gentlemen! you must not think I am Mendelssohn, for at this moment I am Jenny Lind, and as such I thank you from my heart for your delightful surprise. Having now, however, fulfilled my honorable commission, I am again transformed into the Leipzig Music Director, and in that capacity I say, Long live Jenny Lind!"

A genius Mendelssohn certainly was, yet his life exemplifies the assertion that genius is only patient industry. He was the most assiduous of students. Whatever he entered upon he did with his whole heart. He pursued painting for a time with the same fiery zeal with which he pursued music. Though he would sit down sometimes and dash off apparently extempore what have since become some of his most celebrated sonatas, yet both his "St. Paul" and his "Elijah" were the product of several months of study; and between the "Overture to the Midsummer Night's Dream," which was written when he was yet a boy, and the completion of the music of that incomparable piece several years of maturing study intervened. His memory was almost fabulous. On more than one occasion he directed the rehearsals of the orchestra without the score. In one exigency, where several sheets were missing from the manuscripts, he supplied them by his own pen for the various instruments while previous parts of the performance were going on, and gave them out to copyists to transcribe, so that the piece was played from the manuscript, the ink of which was not yet dried. At still another time he extemporized, at the King of Saxony's request, on Gluck's "Iphigenie," not omitting one of the most important airs in the opera, although he had not heard it in seven years.

Elise Polko was one of Mendelssohn's pupils and protégés. She sang frequently at his concerts. She shared the popular enthusiasm which every where was felt for him. She knew him personally, intimately, and in his family relations. Her book is rightly designated *Reminiscences of Mendelssohn*. It is not artistic enough to be a biography. It does not state the day of his birth, nor the age at which he died. In a series of pleasant sketches it carries the reader along with Mendelssohn and his musical companions. It makes him dearer to us than a better biography might do, written by one who knew Mendelssohn less intimately, but the facts

* *Reminiscences of Felix Mendelssohn-Bartholdy; A Social and Artistic Biography.* By ELISE POLKO. Translated from the German by Lady Wallace. New York: Leypoldt and Holt.

of his life more thoroughly. The style is simple; the translation appears to be good; and in external dress the book is worthy of the house which issues it.

It is now nearly half a century since the young Miss Harriet Martineau was thrown upon her own resources by an unexpected change in her father's circumstances. Deafness drove her from the profession of a music teacher, which she at first chose, into the yet more precarious paths of literature. Since that time she has been an active, laborious, and constant writer. The feebleness of her health has certainly not affected the power of her pen. She has published between 35 and 40 volumes, mostly on political subjects, besides innumerable contributions to the current magazines and journals. Her literary labors have done much to change English policy from that of protection to that of free trade. She has attested her sense of the value of independence by twice refusing a pension which Government has offered to her. Since 1852 she has written for the *London Daily News* a considerable portion of its obituary notices. Her life has brought her into personal association with most of those whose characters she describes. The value of these notices has rescued them from the oblivion in which otherwise they would have been buried, and their publication in this country in a book form, by Leyboldt and Holt,* is accompanied by the announcement that the original English edition is already nearly out of print, and that a second edition is in course of preparation. The forty-four biographies which comprise the volume include a large proportion of the leading men of England during the last half century, besides some of foreign nations. The list is classified as follows: literary, 14; scientific, 2; professional, 10; social, 4; politicians, 11; royal, 5.

Of course among these names are some unknown this side of the Atlantic. But for the most part the book will be even more valuable to the American than to the English reader. We confess that we think Miss Martineau's mind rather more keen than discriminating. She possesses a peculiarly unwomanly intellect. She is restrained by no reverence, we might almost say by no regard for the past. In all her opinions she is a pronounced and active radical, both in religion and in politics, and these opinions affect her judgments of the personages who have taken an active and often a hostile part in the battles in which she has always been a participant, never a mere spectator. She is certainly not always generous; we do not think she is always just. Certain types of character she overrates. In some others she attempts, though certainly in vain, to reverse the popular verdict.

But her portraits are all clear, distinct, and positive. Her keenly critical judgment is never deceived by the delusive glare of a transient popularity. She even takes, we fancy, a feminine pleasure in dissecting characters which have passed for great. The intelligent reader will make allowance for those views which pervade all that Miss Martineau pens. And an honest and dispassionate analysis of character, even if it is written in a spirit of criticism sometimes un-

necessarily severe, is a great improvement on the fulsome panegyrics which ordinarily serve the purpose of obituary notices, and which render them fictions not even "founded on fact."

POETRY.

*The Blameless Prince** is the third volume of poetry published by Mr. Stedman, "who," says a literary journal, with great *naïveté*, "may therefore be considered fairly to have won a place among American poets." Mr. Stedman, we fancy, would not admire this test of his claims, and certainly there are other reasons for according him the place than the simple fact that he has published three volumes of rhymes. We do not care to recapitulate the story he has told in such charming verse. It is one of illicit love so successfully concealed that he who was guilty of indulging in it was accounted the Blameless Prince by all but his own conscience. Such a story, where passion and conscience contend for the mastery, requires a dramatist to tell it. Its power lies in its disclosure of secret conflicts, pent up fires, that burn and burn and make the strong man reel like mountains that carry volcanoes in their bosoms, but that never find an outlet in fire and smoke and final ruin. Mr. Stedman is a poet of genuine sentiment. Where his theme demands an *andante* movement he furnishes it with great skill. The rhythm of his numbers is peculiarly musical. But he does not impress us as a man of strong passions himself, nor as one able to comprehend or depict strong passions in others. His poetry is that of a dream, rather than that of the battle; of sentiment rather than of passion; of nature in repose rather than of nature in its fierce commotion. His picture, for example, of the scene when the Blameless Prince first met the woman whose beauty won his heart and later turned him traitor to himself is exquisite; but that of the ride through the woods when, stung by his sense of secret shame, he had bidden her good-by forever, while the darkening clouds obscure the evening sun, and the hurdling storm comes rushing on to avenge the wrongs of the injured Queen, beating him from his horse by an oak up-twisted and uplifted, as a giant might beat him with his mace, falls far short of the scene the hour demands. It is a mild and pleasant storm that comes and goes in a verse or two, and is as inadequate to produce the effects it causes as it is to inspire those sentiments of horror and awe which the poet probably had not experienced himself, and therefore could not awaken in others. In a word, Mr. Stedman is a thoroughly genial poet, who has chosen a theme which required a powerful one. Of the smaller poems which constitute more than half of the book none are poor, and some are exquisitely charming.

MISCELLANEOUS.

My Ten-Rod Farm; or, How I Became a Florist,† came into our hands at an auspicious moment. We had just become the temporary proprietor of a ten-acre farm on the banks of the Hudson. We were ensconced one beautiful sunny afternoon in April on the deck of a Hudson River steam-

boat on our way to take possession. We opened our traveling-bag to look at the books which we had hurriedly cast into it at the office, and our eye lighted upon this title-page with peculiar pleasure. The book is not a pretentious one. It is a little pamphlet of 119 pages. Had we first examined it amidst the smoke and din of the city we should probably have found little in it interesting or attractive. But we had a farm. We were going to become a farmer. We have a special passion for flowers. We have a very modest opinion of our ability to cultivate any thing but weeds. We, therefore, opened the book with great eagerness and read it with great appetite. We found it to be the story of a widow, whose husband had left her with two children to support, and with a ten-rod farm and \$2000 life insurance to do it with. She tried sewing; one day of that was sufficient. In the midst of her despair a wealthy neighbor called and asked the privilege of purchasing some flowers for a dinner-party. This hint gave her a clew. She resolved to become a florist. She did. A few books in her husband's library and some back numbers of the *Agriculturist* afforded her some needed information. In unexpected difficulties unexpected friends suddenly started up to counsel her. Mr. M'Ternan and Mr. Felix gave her just the right advice at just the right time. As her plan grew in importance she found it necessary to have a hot-house; found just the model she needed within a comparatively few miles, and built and stocked one for less than \$1750. Her boy was careless and her plants froze. But in the morning, just as she had discovered it, Providence sent Mr. Felix to the door with instructions how to recover them. The finale of the story is this, that the widow who became a florist is now free from debt, and in receipt of an income of \$2000 a year.

The book filled us with enthusiasm. We had before entertained suspicions that gardening was a science, and required some knowledge if not experience. But here was a woman, confessedly without either, who had achieved success with less difficulties and less failures than not unfrequently attends men whose lives have been devoted to the art. We shut up the book inspired with hope, and determined to go and do likewise. Shall we confess it? A few weeks of actual experiment has somewhat dampened our ardor. All sorts of unforeseen and unexpected difficulties thwart us. Our books never contain the information we want, or if they do we never can find it. We hire a boy to help us. He inwardly chuckles at the ignorance of which we are so painfully conscious, yet does not know so much himself. He gets tired of the job when it is half done, and pleads home duties as an excuse to go off to his sports. We try to hire a man, but all about us are men as helpless as ourselves, and our gardener can never come to us when he is wanted. We have to wait till every body else is through plowing before we can hire the plow for our own ground. When at last our seed is in the ground we discover a flock of hens from our neighbor's yard industriously picking it out again. No Mr. M'Ternan nor Mr. Felix drops in on us at opportune times to counsel us. And we are gradually coming to the conclusion that the one condition necessary in order to become a florist without knowledge or experience is, that

one must be a charming young widow with a respectable estate.

Mrs. Gilman's slur upon the ministry, pages 73 to 77, is as unjust as it is unnatural. If she is what she pretends to be—a New England woman—she knows very well, or ought to know, that a large proportion of New England clergymen are practical farmers; that except the few who are "cribbed, cabined, and confined" in smoky cities, nearly all raise with their own hands the vegetables for their own table, while the parsonage is of all houses in the village most apt to nestle among flowers which the parson's wife and daughter have reared with their own hands. There is no one in all the community from whom the fictitious widow of "My Ten-Rod Farm" would have been more sure to find cordial sympathy and cordial co-operation in her floral plans than from the minister.

REV. W. H. H. MURRAY, the popular but eccentric pastor of the Park Street Church in Boston, has been accustomed to spend his summers in the Adirondacks. He is evidently fond of fishing and adventure, and still more fond of telling marvelous stories, which make his auditors' eyes open with wonder and with admiration of the narrator, who is always the central hero of them. He wrote some account of things that he saw, did, and imagined, in his fisherman's experience, for the pages of the *Meriden Literary Recorder*. His transference to a wider field of labor in Boston opened the way for their publication to a wider circle, in a book form.* They possess the merit of a certain sparkle and vivacity such as often belongs to the stories of sportsmen and tourists of the Baron Munchausen order. We are sorry to say they possess little other. One expects when a Christian minister takes up his pen that something of his Christian profession will be apparent in what he produces. If he writes of fishing—and it is a good theme—he will at least imbue his pages with something of those moral sentiments which render Ike Walton's pen so genial a one, if there is not also evident that high appreciation of God in nature which makes most that Mr. Beecher writes on the same subject more than a poem. These characteristics are almost wholly wanting in Mr. Murray's book. The only approach to either is a rather commonplace and conventional chapter on "A Sabbath in the Woods." For the rest the book, besides an introductory chapter which contains some useful information to fishermen and tourists, is made up of narrations so incredible that we are obliged to accept the advice of the author "to believe no more of it than you see fit," which is not a great deal. In fly-fishing he strikes three trout at once and brings them all to shore, losing but one in the landing. He catches a deer by the hind leg, is kicked off after a protracted conflict, and the guide comes to his aid just in time to catch and capture the unfortunate animal by the tail. He sees the ghost of an Indian girl, follows it, by night of course, in his canoe, is whirled over a perpendicular fall twenty-five feet high, and comes up safe, neither boat nor huntsman injured. On the whole we

* Adventures in the Wilderness; or, Camp Life in the Adirondacks. By WILLIAM H. H. MURRAY. Boston: Fields, Osgood, and Co.

think the book will widen the circle of Mr. Murray's reputation more than it will enhance it. We can only express the hope that he is as vigorous, as enthusiastic, and as courageous in fishing for men as he represents himself to be in fishing for trout.

AMONG other volumes of lesser note which we have received during the past month we group a few together here in a single paragraph. Professor Theodore S. Bell, of Louisville, Kentucky, sends us an interesting and instructive pamphlet on the *Pre-historic Ages of Scandinavia and the Lacustrine Dwellers of Switzerland*. From the implements found in the peat-bogs of Denmark, and from the remains of ancient villages found beneath the waters of lake Zurich, as well as from a brief consideration of some monumental evidences of ancient Phœnician life, he sketches very briefly these civilizations of antiquity for the purpose of pointing out the moral unity, and tracing the progress of mankind. His limits are such as necessarily render the discussion but a sketch. We miss, too, the diagrams and illustrations with which the original lecture was accompanied. But the outline he affords is sufficient to show his familiarity with the subject; and he combines a spirit of reverence for religious truth with that fearlessness of investigation which is the first condition of true science.—Felt and Dillingham send us two volumes of *Cassell's Representative Biographies*, Disraeli and Queen Victoria. They are cheap, convenient in form,

readable, and serve a very useful purpose in giving in an hour's perusal useful information concerning the subjects of the memoirs.—*Leander; or the Secrets of the Priesthood*, by Ernest Freeman, purports to be a true tale of a young American's experience among the Jesuits. In his preface he denies that it is a novel. If it is, it is rather a tame one. If it is a true experience there is nothing so remarkable in it as to justify its publication.—*The Brawnville Papers*, by Professor Moses Coit Tyler, is a rather spicy but not otherwise remarkable plea for "muscular Christianity," under guise of records of an athletic club.—*Evening by Evening*, a companion volume to "Morning by Morning," is a series of devotional readings for every day in the year, by Rev. C. H. Spurgeon, characterized by the plainness, simplicity, pointedness, and barrenness of ornament which belongs to all he writes or says.—The readers of *Harper's Magazine*, who have already laughed over the experiences of the Senator and his companions, as narrated in the veracious and authentic records of the *Dodge Club*, do not need to be reminded how spicy and readable those records are. They are now published by Harpers in book form, and are just the volume for the cars, the steamboat, and the hotel, in summer travel, when one wearies of a long continuous novel, and flees the presence of more solid and instructive literature, but demands something which he can take up and lay down at pleasure—always sure of broad and genial humor, open where he will.

Monthly Record of Current Events.

UNITED STATES.

OUR Record closes on the 29th of April. Congress adjourned on the 10th of April, but the Senate was, by order of the President, convened for executive business. This session of the Senate was closed on the 22d. We present a resumé of the principal doings of the different departments of Government during this month:

On the 7th of April the President sent to the Senate a message stating that it was "desirable to restore the States which were engaged in the rebellion to their proper relations to the Government and the country at as early a period as the people of those States shall be found willing to become peaceable and orderly communities, and to adopt and maintain such constitutions and laws as will effectually secure the civil and political rights of all persons within their borders." The President suggested that, in regard to Virginia, a law should be enacted authorizing an election to decide upon the acceptance of the Constitution adopted by a Convention on the 17th of April, 1868. He also suggested whether the Constitution framed in Mississippi, and rejected, might not be "again submitted to the people of that State in like manner, and with the probability of the same result."

A bill was framed, passed both Houses by large majorities, and was approved by the President on the 10th. Its provisions are in substance:

§ 1. The President may submit the Constitution framed in *Virginia* to a vote of the registered elect-

ors; and may also at his discretion submit separately any provision or provisions thereof.

§ 2. At this election, in *Virginia*, State officers and members of Congress may be voted for. Provision is also made for the registration of voters, and the manner of holding the election.

§ 3 contains essentially the same provisions for *Texas*; but with the additional proviso that "no election shall be held in that State, for any purpose, until the President so direct."

§ 4 makes for *Mississippi* the same rules as those for *Virginia*.

§ 5 provides that if in either of the above States the Constitutions be ratified, "the Legislatures shall assemble on the fourth Tuesday after the official promulgation of such ratification by the military officer commanding in said State."

§ 6. "Before the States of *Virginia*, *Mississippi*, and *Texas* shall be admitted to a representation in Congress, their several Legislatures which may be hereafter lawfully organized shall ratify the fifteenth article which has been proposed by Congress to the several States as an amendment to the Constitution of the United States."

§ 7. "The proceedings in any of the said States shall not be deemed final, or operate as a complete restoration thereof, until their action respectively shall be approved by Congress."

A bill to amend the Judicial System of the United States was passed, and approved by the President. It provides in substance that the Supreme Court of the United States shall consist of the Chief Justice and eight Associate Justices, of whom six shall constitute a quorum; for each of the nine existing Judicial Circuits there shall be appointed a Circuit Judge, who shall reside in his Circuit, and have the same powers as the Justice named for that Circuit; these Circuit

Judges to receive a salary of \$5000. The Justices must each attend at least one term in his district during every period of two years. Any Judge of any Court of the United States, who has held his commission for ten years and has attained the age of seventy years, may resign, and shall receive during his life the same salary as was payable to him at the time of his resignation.

The Public Credit Bill, the Currency Bill, and the Tenure-of-Office Bill, as noted in our last Record, were approved by the President.

Among the most notable measures which came before the Senate in executive session was the treaty with Great Britain. The treaty relates essentially to the *Alabama* claims, negotiated by Mr. Reverdy Johnson with the British Government. On the 14th of April Mr. Sumner, from the Committee on Foreign Relations, presented a report against its confirmation. Mr. Sumner accompanied the report with an elaborate speech reviewing the whole question in controversy. The proposed treaty, he said, was "nothing but a snare;" it left "untouched the massive grievance under which our country has labored for years;" for these there was not in the treaty "one word of regret or even of recognition, nor any semblance of compensation." It could not be for the interest of either party that such a treaty should be ratified. The negotiation of the treaty was unduly hasty; it seemed as though the "negotiators were engaged in huddling something out of sight;" "the national cause was handled as though it were a bundle of individual claims;" there was no "recognition of the rule of international duty applicable in such cases;" and it seemed to provide that this vital question should never hereafter be presented.

Mr. Sumner then proceeded to set forth our "true ground of complaint" against Great Britain. The vital point as stated by him is that, setting aside the question of the recognition of the belligerent rights of the so-called Confederate States upon land, and the wholly unfriendly manner toward the United States in which this was conceded, their recognition as belligerents upon the ocean was "without any of those conditions which are the essential prerequisites to such a concession;" or, as otherwise phrased, "admitting that the Confederates were belligerents on the land, they were never belligerents upon the ocean," for belligerency is a fact to be shown, not a principle to be assumed; and "whatever power the rebels possessed upon the land they were always without power on the ocean." This recognition of belligerency was the first stage in the depredations upon our commerce; without it, as stated by Lords Brougham and Chelmsford, "If any Englishman were to fit out a privateer for the purpose of assisting the Southern States against the Northern States, he would be guilty of piracy." Mr. Sumner then proceeded to examine how far the use of the word "blockade" in the President's proclamation justified the action of the British Government; and showed that no such justification was found in the use of this word instead of the more appropriate phrase "closing of the ports." He then narrated the essential facts in the case of the *Alabama*, citing the recorded opinions of Mr. Collier, the British Solicitor-General, that it was the "plain duty" of the British Government to "stop

her" from going to sea; that of Lord Brougham, that suffering her to go to sea was an instance of "crass negligence;" and that of Lord Russell, that it was "a scandal and a reproach." He then showed that from first to last the *Alabama* was a British vessel, built in British waters, armed and supplied from British ports, and manned almost wholly by British subjects, and every where protected in British harbors. He might have added, that she sailed usually under the British flag. The conclusion of all is, that "no British cruiser could allow her to proceed, no British port could give her shelter without renewing the complicity of England."

Having thus shown that Great Britain is justly liable for all injury inflicted upon us by the *Alabama* and other such-like vessels, Mr. Sumner proceeds to hint at rather than put down the amount of these damages; the result being that "Every British pirate was a public nuisance, involving the British Government, which must respond in damages, not only to the individuals who have suffered, but also the National Government, acting for the common good of all the people;" that the "measure of damages is, by the laws of nations, whatever may have been lost or might have been gained," and that "the colossal sum total may be seen not only in the losses of individuals, but in the destruction of our commerce and the prolongation of the war—all of which may be traced directly to England." Mr. Sumner says:

Three times is this liability fixed: *First*, by the concession of ocean belligerency, opening to the rebels ship-yards, foundries, and manufactories, and giving them a flag on the ocean; *Secondly*, by the organization of hostile expeditions, which, by admissions in Parliament, were nothing less than piratical war on the United States; *Thirdly*, by welcome, hospitality, and supplies extended to those pirate ships in ports of the British Empire. Show either of these, and the liability of England is complete. Show the three, and this power is bound by a triple cord.

Mr. Sumner then gave a brief resumé of previous negotiations, noting especially the official reply of Earl Russell, August 30, 1865:

Her Majesty's Government must decline either to make reparation and compensation for the captures made by the *Alabama*, or to refer the question to any foreign state.

Mr. Sumner said, in conclusion:

Had the early overtures of our Government been promptly accepted, or had there been at any time a just recognition of the wrong done, I doubt not that this great question would have been settled; but the rejection of our very moderate propositions, and the protracted delay, which afforded an opportunity to review the case in its different bearings, have awakened the people to the magnitude of the interests involved. If our demands are larger now than at our first call, it is not the only time in history when such a case has occurred. . . . Shall these claims be liquidated and canceled promptly, or allowed to slumber until called into activity by some future exigency? . . . Down to this day there has been no acknowledgment of this wrong. Such a generous expression would be the best assurance of that harmony between two great and kindred nations which all desire.

The treaty was rejected by the Senate, by a vote of 54 to 1.

The treaties relating to naturalization were ratified with Great Britain, Belgium, and several of the minor German states. They are essentially the same as that with the North German Confederation, noted in our Record for April, 1868.—A treaty negotiated with the States of Colombia, relating mainly to the transit across

the Isthmus, was laid over until the next session of Congress.

Besides these treaties the main business of the Executive session of the Senate related to nominations for office. The most important of these were those of Ministers to foreign states. Here are many changes. Mr. Dix was recalled from France at his own request; Mr. Bancroft remains at Prussia; Mr. Sanford, now Minister to Belgium, was nominated for Spain, and Mr. Jones for Belgium; these nominations were not acted upon; so that Mr. Hale remains for the present at Madrid. At the close of April the most important foreign missions are definitely filled as follows:

Great Britain.—J. Lothrop Motley, *vice* Reverdy Johnson.

France.—E. C. Washburne, *vice* John A. Dix.

Austria.—John Jay, to fill vacancy caused by the resignation of J. L. Motley.

Prussia.—George Bancroft.

Italy.—George P. Marsh.

Turkey.—Edward Joy Morris.

China.—William A. Howard, *vice* J. Ross Browne.

It is understood that the present occupancy of several important missions, among which are Brazil, Belgium, Spain, and Mexico, is merely temporary.

Among the nominations made and confirmed are those of Mr. Longstreet for Surveyor of New Orleans, and Mr. Crowe as Governor of New Mexico; both these men had been generals in the Confederate service, but since the close of the war they have acted in favor of the Republican party. Mr. Parker, an Indian by birth, who had acted on General Grant's staff, was appointed Commissioner of Indian Affairs. Men of color were nominated as envoys to Hayti, Guatemala, and Liberia.—The entire number of nominations sent in by the President up to April 20 was 1080, of whom 438 were Postmasters, 236 belonging to the Internal Revenue Department, 134 to the Diplomatic service, including Ministers and Consuls; the remainder being made up of miscellaneous nominations, the majority pertaining to the Revenue Department.—During the closing days of the session many more nominations were sent in.—A very large majority of the nominations made were confirmed.—The executive session closed on the 22d of April.

SOUTHERN AMERICA.

From *Mexico* we have accounts of revolutionary movements in various quarters. The only really important fact is, that President Juarez has been authorized by Congress to recognize the belligerent rights of the insurgents in Cuba.

The war on the *Plata* seems now to have approached its close. Lopez, the President of Paraguay, had been driven from his capital, and with only a few thousand men had taken up a position in the interior. At our latest dates, which come down to the 1st of April, the allied forces were making preparations for a final attack, and expected to advance into the interior of Paraguay.

We have the usual reports of insurrections and revolutions in the various South American States. The latest relates to *Venezuela*; but authentic details are wanting.

Of far more importance is the progress of the uprising in *Cuba*. Of this, however, no accounts that can be regarded as reliable are received. Re-

ports are every day put forth of successful actions on both sides; but they are wholly unreliable. We have also reports of armed expeditions sent from the United States in aid of the insurgents; but our naval officers, who hold command in these waters, are confident that no formidable force has as yet been dispatched, and certainly has not landed in Cuba. All that is now certain is, that the island is in a perturbed state; that the question of its future will, in a great measure, depend upon the turn which affairs take in Spain; and that in the mean while every one who can possibly get away is departing either for Europe or the United States.

EUROPE.

The daily telegrams from Europe may be summed up in a few words: The great Continental Powers, France and Prussia, rather ostentatiously announce that there is no prospect of any war; but both are busily engaged in putting their forces upon the best possible war footing. Here and there some slight apparent diminution is ostentatiously paraded; but the real military force is steadily augmented.

In *Great Britain* the main subject of interest pertains to the Church question in Ireland. This has come up in several shapes; but the general result is, that the present Government has a clear majority of more than 100, out of some 600 votes.

The affairs of *Spain* are of the most immediate interest; yet here nothing can be considered fairly settled. Even the form of government is undecided. The draft of a Constitution has been presented to the Cortes, by a committee appointed for that purpose. We give an abstract of this draft, which consists of nine Chapters, subdivided into one hundred and twelve Articles:

CHAPTER I. relates to *Spaniards and their Rights*.—Every person born in the Spanish dominions, children of Spanish parents born abroad, and naturalized foreigners, are Spaniards. They possess the ordinary personal rights as to person and property recognized in the United States and Great Britain. They can, orally or in writing, express their opinions; but open-air meetings or demonstrations can only be held by day.—The Catholic religion is to be maintained by the state; but the public and private exercise of other forms of worship is permitted with no other restrictions than the universal rules of religion and morality.—Any Spaniard can leave the country, with his property, subject only to the obligations accrued of military service and taxes.

CHAPTER II. relates to the *Public Powers*.—The form of government is a monarchy. The Cortes makes the laws, the King sanctions and promulgates them; the King exercises his power through his ministers.

CHAPTER III. relates to *Legislative Powers*.—The Cortes consists of two bodies, the Senate and the Congress; the former to be renewed by fourth parts every three years; the latter wholly renewed every three years. The Cortes must meet every year, and be in session at least four months. The proceedings must be public, except in certain special cases. The Senators are elected by provinces. A Senator must be forty years of age, and must have held previously certain specified offices, except that in each province the fifty largest tax-payers and the twenty largest contributors to industrial and commercial subsidies are eligible without having gone through the previous offices.—Congress will be composed of one deputy for 40,000 of population. A member must be a Spaniard in possession of civil rights, and twenty-five years of age.

CHAPTER IV. relates to the *Executive Power*.—The person of the King is inviolable; he nominates and dismisses his ministers, who are solely responsible for all the acts of the King. The powers of the King, exercised through the ministry, are essentially the same as those possessed by the sovereign of Great Britain. The "dotation" to the crown will be fixed at the commencement of each reign.

CHAPTER V. relates to the *Succession and the Regency*.—The royal authority is hereditary; the nearest lines in order of primogeniture to be followed; in each line males to be preferred before females; and in the same sex the older to the younger. The Cortes may exclude from the succession any one who is incapable of governing, or who has done any act to merit the loss of his right. Should the dynasty become extinct the Cortes will make a new choice; and when there is no sovereign, or the existing one is incapable of exercising his powers, the Cortes will appoint a Regency consisting of several persons. The King becomes of age at eighteen; and if the sovereign is a Queen, her husband has no part in the government of the kingdom.

CHAPTER VI. relates to the *Ministers*.—Their functions are essentially the same as in the British Government. No act of the King is valid unless signed by the minister to whose department it belongs. In case of dereliction of duty the Congress accuses, and the Senate judges upon the accusation.

CHAPTER VII. relates to the *Judicial Power*.—The essential points are that to the tribunals belongs the power to apply the laws in all cases; and that all political and civil offenses are to be tried by jury.

CHAPTER VIII. relates to *Public Forces and Taxes*.—Government must, near the opening of each session of the Cortes, present to it an estimate of expenses and revenue. No payments can be made unless regulated by law. The public debt is sacred. The Cortes will every year fix the number of land and sea forces. No permanent armed force can exist unless authorized by special law.

CHAPTER IX. extends the provisions of this Constitution to the Colonies of Spain; fixes the manner of making changes in the Constitution; and provides that any law to be passed for the election of a King will be considered a part of the Constitution.

This proposed Constitution embodies the essential features of the governments of the United States and of Great Britain. The Cortes is constituted like the American Congress. The upper House, instead of being hereditary, as in Great Britain, is elective, the members being chosen for long terms, and one-third of the members go out every year. The lower House is elective, the representation being based wholly upon population, instead of the mixed system of the British House of Commons. The sovereign, as in Great Britain, reigns, but does not rule; is personally irresponsible, and exercises his powers only through ministers, who are responsible to the Cortes. The law of succession is, as in Great Britain, *semi-Salique*; that is, females inherit in preference to males of a more remote degree of consanguinity, but males in the same degree are preferred to females, irrespective of order of birth; that is, a son of the sovereign precedes all daughters, no matter of what age. There is one special provision which is worthy of note: The Cortes may set aside any heir to the crown whom it judges unfit to reign.—This proposed Constitution is now undergoing debate in the Cortes, and will probably be somewhat modified. The question of the person to whom the crown shall be tendered is wholly undecided. It was informally offered to the ex-King of Portugal, who declined absolutely. A proposition to exclude the Bourbons was voted down; but the ex-Queen and her children were excluded. The most prominent candidate is the Duke of Montpensier; yet there are not wanting many close observers who think that a Spaniard, probably General Prim, will be placed at the head of the Government, but under some other title than that of King.

THE EAST.

The civil war which has for many months been waged in *Japan* seems now to have come to a

close. As far as we can now judge it has been a contest between the several great feudal lords known as "Daimios." The nominal power of the empire rests with the "Mikado," or titular Emperor "by divine authority;" but for some generations this has been nominally exercised by a representative, whose title is the "Shiogoon," which has usually been written in English as the "Tycoon." This functionary was the only one with whom foreigners came into relations; and it came to be understood that the Tycoon was the "temporal Emperor," while the Mikado was the "spiritual Emperor," having only to do with religious affairs. In the course of time the Tycoonship became hereditary in one family of the Daimios. At length an effort was made to set aside the Tycoon, and to restore the Mikado to the actual as well as the nominal rule of the empire. This purpose became complicated with the question as to the opening of Japan to foreign intercourse. Each great Daimio for a while acted almost independently, and a long series of hostilities took place. Finally the Tycoon and those who sided with him were put down, and the authority of the Mikado established. Still, if we can judge, the real power rests with certain of the great nobles—the present Mikado, a lad of seventeen years old, being little more than a lay figure. The most notable thing in the present state of affairs is that representatives of foreign Powers have recently, for the first time in the history of the nation, been brought into personal contact with the Mikado.

A dispatch from Commodore S. P. Carter, dated at Yokohama, January 20, describes this interview, which took place on the 5th. The persons received were the American, Prussian, and British Ministers. All the cross streets leading to the castle were barred by ropes stretched across, and a large police force was stationed to prevent possible disorder. Entering the castle, the Ministers were shown into a waiting-room, and were told that the Mikado would soon be ready to receive them; the court band all the while playing a doleful strain, resembling a funeral dirge or a *miserere*.

The Mikado now entered the audience chamber. The visitors were introduced, bowing once at the threshold, again half-way up to the dais upon which the Mikado was seated, and again upon reaching the dais. The Mikado was seated upon a throne like an arm-chair, his guards, dressed in black and red, standing around. The room was so dark that little could be distinctly seen. As far as the strangers could remark the Mikado was a lad of seventeen, "dressed in a robe of white silk, and petticoat trowsers of crimson, and had on his head a curious head-dress of fine wire." He, however, "bore himself with becoming dignity."

The formal presentation being over, the Japanese Minister of Foreign Affairs gave a state dinner—or rather two dinners in one, the first being in Japanese style, and the second in European form. At the latter toasts were proposed and healths drank in honor of the President of the United States, the Queen of Great Britain, the King of Prussia, and the Mikado. Thus closed the first official audience which any foreign representative has ever had with the titular Emperor of Japan.

Editor's Drawer.

JUNE!

"And what is so rare as a day in June?

Then, if ever, come perfect days;

Then Heaven tries the earth if it be in tune,

And over it softly her warm ear lays."

At the Convention of the Episcopal clergy of Pennsylvania, in 1836, for the division of the diocese, the Right Reverend Bishop M'Coskry, of Michigan, was present. When the subject of a name for the new diocese came up for discussion several were proposed—as Western Pennsylvania, Pittsburg, Monongahela, etc. When the last name was mentioned the Bishop rose with great gravity and seriousness, and remarked that he was entirely opposed to the last-mentioned name, Monongahela, and, if seriously urged, would enter his solemn protest; "For," said he, "I am of the opinion that whenever *that* name is spoken it will cause my brethren, as well as the laity, to make *rye* faces."

The proposal was immediately withdrawn.

A GENTLEMAN prominent in the judiciary of North Carolina mentions a little statement recently made in one of the courts of that State during the progress of a cause. In his address to the jury ex-Governor —, who is something of a wag, stated that the plaintiff was playing at a game of "bluff," and that, although he had not so much as a "pair of deuces" in his hand, he bragged as if he had an "Arkansas flush" (three jacks and a bowie-knife). The counsel opposed in replying to this technical allusion, said: "Gentlemen of the jury, it is evident that the Arkansas hand is held by the defendant. You can see that the witness N—— is equal to a two-edged bowie-knife, and *every one knows that Governor —— is equal to more than three knaves!*"

THE same authority says: While writing this note an incident has occurred which is a little amusing. A man was on trial for stealing a pig. The owner testified to finding a similar pig, taking it home, and setting it loose in the presence of the bereaved porcine ancestress. "Well," said the solicitor (for the State), "how did the sow receive it?"

"*With outstretched arms, Sir!*" triumphantly replied the witness.

THE following, illustrative of the proverbial antipathy that exists between the Irish and Welsh, comes from a gentleman in a foundry up in the Lehigh Valley, where the incident took place: A car which had been thrown off the inclined plane contained two Welshmen and an Irishman. One of the Welshmen and the Irishman were killed. The funeral sermon of the former was preached by a Welsh minister, who was not more free than his lay brethren of this hatred of Pat. He took for his text the words from Matthew, xxiv. 40, 41: "Then shall two be in the field; the one shall be taken, and the other left. Two women shall be grinding at the mill; the one shall be taken, and the other left." And by way of illustration this dispenser of the Word said: "My brethren, the case before us is *exactly* parallel with that of the text—*two* men, one of whom was taken, the other left. Do you

say there were here *three* men, two of whom were taken? No, dear brethren, *no!*—*the dead Irishman counts for nothing!*"

A BALTIMORE correspondent thinks this appropriate for the Drawer:

The recent influx of Cubans to this city, bringing a metallic currency, gives our shop-keepers an opportunity to calculate premiums in making change. One of these new-comers stopping at the — Hotel, ordered a waiter to bring a bottle of wine and the change, giving him a doubloon. The waiter, formerly a plantation hand, being accustomed to see nicely-engraved heads of Mr. Fessenden, or some other official, tendered for such luxuries, handling the metal suspiciously, said: "That won't buy nothin'; you can't play that here—trying to pass your *baggage-check!*"

AN English friend, familiar with the operations of missionary societies, furnishes the following instance of the probable effects of the hot as compared with the frigid style of preaching among the inhabitants of Labrador. It seems that an old missionary, who had been many years in that country, was at length compelled to return, his influence all gone and his mission entirely fruitless. A young man, who was just fledging into the ministerial status, was appointed in his place; and before he went to his assignment he thought he would visit his venerable predecessor and learn from him the cause of his trouble in the land of icebergs. The old man received him very cordially.

"My venerable brother," said the young man, "I wish you to tell me the cause of your difficulty, that I may avert a like failure. Must I preach to them a hell that is hot?"

"No, my young friend," said the old missionary, laying his hand on his brother's arm; "no, that was the rock I split on. I preached it very warm to them, and they rather liked the idea of going there. I think if you preach them a hell fifty degrees colder than Labrador you will drive them all to repentance."

GOOD-FRIDAY is not a day suggestive of mirth, yet it has given birth to one little witticism that lawyers sometimes refer to facetiously on Holy-Thursday. It was of the Protestant Judge who on the latter day directed the crier, in the usual way, to "adjourn court until to-morrow morning." "What!" exclaimed a holy lawyer, "adjourn until *to-morrow!* Why, your Honor, to-morrow will be Good-Friday, and the only judge ever known to hold court on that day was Pontius Pilate!" Of course a further adjournment was ordered. This anecdote elicited the statement from a gentleman of prominence on the bench that judicial records furnish no instance of a criminal having been either sentenced or executed on Good-Friday.

SPEAKING of Pontius Pilate recalls the expression of a gentleman, made a few evenings since, in reference to Israelites. After quoting Baron Rothschild's remark that "when a Hebrew becomes opulent people call him an Israelite; if

poor, they call him a Jew." "A more courteous way to speak of a person of Hebrew extraction," said he, "would be simply to describe him as a descendant of one of a party of gentlemen who, on a certain occasion, crossed the Red Sea at low-water-mark!"

FEW of the great preachers of the country are so felicitous in illustrating their subjects with appropriate anecdotes as the Rev. Henry Ward Beecher. And, like all men of genuine humor, he has the knack to say very droll things with a face of the most impassive gravity. At the National Christian Convention held last year in this city he was called upon to address that body on "How to Conduct Prayer-Meetings," and for an hour held the audience with a mingling of fun and pathos and sentiment and wisdom such as one but seldom enjoys. After the adjournment of the morning session about fifty men—mostly young, and identified with the hardest of Christian work in the most unpromising fields—gathered about him, in order to wrest from him some of the secrets of his success. The results were too valuable to pass without enduring record. The questioning lasted nearly an hour and a half. During that time Mr. Beecher was in the centre of a densely packed crowd, and not given a moment's rest. The questions were sometimes rambling, but nearly all tended to uncover an inward experience that others besides those then present would be glad to see. Omitting, of course, many things, the questions and answers were very nearly as follows:

"Mr. Beecher, what do you do with bores in your prayer-meeting?"

"Well, I try to be patient with them. Christ, when He was on earth, was troubled with bores, and I say to myself, Why should I not be? I try to educate them, and make something out of them. The man who is a bore now may become an effective worker if one is only patient."

"Well, but Mr. Beecher"—it was Mr. Moody that interrupted, as one might almost know from the character of the question—"there are some that are confirmed bores, and if you let them go on they will smash a prayer-meeting all to pieces; what do you do with them?"

"I never have and never will allow any one to 'smash' a prayer-meeting. If I can not bring about a reformation by privately talking to him, if no other means will answer, I can say to such a man, *sit down*. But then, there are many ways to be tried first. If I see that a man is apt to talk in set phrase and continually repeat, I interrupt him with a question. A question is an obstruction in his track. He will have to get over it, or go around it, or come to a stand-still. I ask him about his own experience in relation to what he is talking about, and in such a conversation there is no chance to be formal."

"Do you make special preparation for a prayer-meeting?"

"Yes. That is, I always have a subject in my mind that I want to present. Sometimes it is adhered to by others, and sometimes it is not. When it is not, I never try to bring it back, but I try to develop the thought that comes out the most prominently. I try to find out as quick as possible the leadings of the Holy Spirit, and then follow them."

"Did you ever have to exercise any authority in prayer-meetings of the nature you alluded to?"

"I had one man once that used to trouble me a great deal. He used"—and here Mr. Beecher impersonated him to the life—"he used to drag his words in the most tediously slow process that you can imagine. One evening he commenced as usual: 'I—hope—that—my—young—friends—will—not—like—me—to—put—off—their—consideration—of the interests of eternity,' and just then I interrupted him by saying, 'Mr. —, if you go on that way much longer, eternity will be here and half through before you finish!'"

THE Hon. Josiah Adams, now deceased, was one of the best-known legal gentlemen of the Middlesex (Massachusetts) bar. He was more remarkable for wit than for personal beauty. A correspondent once remarked to him: "Mr. Adams, how are you?—you're looking first-rate." "Yes, yes," said the old gentleman; "just what one of my neighbors said to me a short time ago. I met," continued he, "one of my neighbors, and he said to me, 'How are you? You look very well; in fact, you grow handsomer every day.' 'Ah,' said I, 'how is that?' 'Why, to tell you the plain truth, *you can't grow any other way!*'" Mr. A. questioned not the premises, but made a profane expression about his conclusion.

JUDGE G—, who presides in one of the county courts of Connecticut, had recently before him one Felix M'Gorran, indicted for assault and battery. At the instigation of his counsel Mrs. M'Gorran appeared at the trial with her five children, all about the same size, the eldest not four years of age. Mrs. M'Gorran, with true Irish zeal, began to plead the cause of her husband, when the Judge stopped her, and, pointing to her children, inquired if they were all *witnesses* in the case. "No, yer Honor," replied Mrs. M'Gorran, "they are *mainly twins!*" Mister M'Gorran was discharged with a reprimand.

THE late elder John Smith, of Kentucky, who died recently at an advanced age, was one of the most eccentric wits south of the Ohio River, a man of learning, an eloquent preacher, and a true Christian gentleman. He was familiarly known throughout Kentucky and the West by the *sobriquet* of "Raccoon Smith." While still in the Baptist ministry, and attending one of the annual meetings of that body, a tall, lank, green specimen of humanity presented himself before the Association as a candidate for the ministry. He was not regarded as being of entirely sound mind, and labored under the hallucination that he was specially "called to preach," and kept continually importuning the Association to grant him the necessary license. In addition to his partially unbalanced mind, young Weeks was the possessor of as huge and ungainly a pair of feet as ever trod shoe-leather. Tired of his importunities, and not being disposed to grant the license, the Association handed him over to Smith, with instructions to make an end of the case; and between them took place the following conversation:

SMITH. "So, Brother Weeks, you think you have a special call to preach?"

WEEKS. "Yes. The Lord has called me to the work, but the Association refuse the license."

SMITH. "How do you *know* you are called?"

WEEKS. "*Know* it? I *feel* it in my heart of hearts. I want my license."

SMITH. "Do you believe the Bible, Brother Weeks?"

WEEKS. "Certainly I do—every word of it."

SMITH. "Well, if I can prove by the Bible that you are not called to preach, will you be satisfied to drop the matter, and not further importune the Association for a license?"

Brother Weeks assented to this, and "Raccoon Smith" deliberately opened the New Testament at Romans, x. 15, and in a grave tone read: "How beautiful are the feet of them that preach the Gospel of peace," etc.; then, glancing at Weeks's large feet, remarked: "You see, Brother Weeks, that the Bible declares that the *feet* of the preacher are beautiful; you, Sir, have the most monstrously ugly feet of any man in the State of Kentucky; therefore, by the Bible, it is clear you have not been specially called."

As Smith finished his remarks the entire Association went off in a paroxysm of laughter, and Weeks, really concluding that he had *not* been "called," bolted from the meeting-house, and never afterward annoyed the Association for a license.

JUSTICE DOWLING's greatest bother in court is with woman. Sometimes, however, he manages to get even with her. Last term one of those strongly developed females who are guilty of legal irregularities was brought before him for some ordinary offense. A decent regard for accuracy compels us to state that she was not lovely of feature.

"What are you here for?" asked the Judge.

"My beauty, I reckon."

"Your what?"

"My beauty."

"Are you certain of that?"

"Bedad there's no mistake."

"Then I discharge you; you're not guilty."

The woman from "the first gem of the say" emerged from the presence.

AN officer of this Government, whose functions are exercised in Fernandina, Florida, has a little son of four years. He thinks the little son of four years smart. The mother was one morning combing the head of the little son, and said: "Fred, what under the sun makes the top of your head so dirty?" Fred having been instructed that God made him out of the dust of the earth, replied, "Don't know; 'spect it mus' be some t' was left over when I was made!"

IN Miss Martineau's recently published Biographical Sketches is a little anecdote of Sydney Smith on the late Bishop Blomfield that may be new to some of our Episcopal readers. The Bishop was so thoroughly conscientious, and considered himself and the Church so completely identified, that, according to the reverend Sydney, the form of his dinner invitations was—"The Church of England and Mrs. Blomfield request the pleasure," etc., etc.

THE ingenuity of the enterprising inventor and vendor of patent medicine may be seen in the

advertising columns of every newspaper in the land. Show us a newspaper without one! We confess to a laugh over the following, taken from the "special notices" of a religious contemporary:

"If you want a really pure, unsophisticated, 'family pill,' buy Dr. R——'s liver-encouraging, kidney-persuading, silent perambulator—twenty-seven in a box. This pill is as mild as a pet lamb, and as searching as a small-tooth comb. *It don't go fooling about*, but attends strictly to its business, and is as certain as an alarm-clock."

The pill that goeth not "*fooling about*" is the true orbed cathartic.

A WESTERN correspondent contributes a little anecdote of the Hon. Henry L. Dawes, who was the prominent candidate, at one time, of the Republicans for Speaker of the House, but who gracefully withdrew in favor of Mr. Blaine. When quite a young man Mr. Dawes was noted for his diffidence. As a public speaker it was "difficult to get his mouth off." A suit was one day pending before a Justice of the Peace at North Adams, and the speech of a very eloquent lawyer attracted a crowd, which filled the office and blocked up the doors and windows. The old Justice, needing fresh air, at length stopped the orator, and quietly remarked: "I wish you would sit down and let Dawes speak a little while. *I want to thin out this crowd.*" That was some years ago. Since then Mr. Dawes has so learned to "get his mouth off" as to become one of the strongest debaters in Congress.

THAT was very neat of young Dumas, who lately received from a young and hopeful author a manuscript with this memorandum: "It is the work of *six days*." Dumas returned it with this sentence: "You should not have rested on the *seventh*."

Now and then one meets in the columns of the daily journals one of those delicious bits of humor, so keenly relished at the moment, but which, in the "eternal grind of business," are so quickly lost to memory. Some two years ago, in glancing at the editorials of the *Tribune* newspaper, our cachinnatory apparatus was set in play by the following little article on "Music in Politics." We clipped and put it aside for future reproduction, satisfied that the grotesqueness of its humor would be quite as highly enjoyed now as it was on the day of its issue:

"Mr. Choate's rather dubious metaphor about 'keeping step to the music of the Union' has received a concrete illustration. An American gentleman of genius—name not stated, but at present irradiating the city of Paris—has set the Constitution of the United States to music! No particulars are given, so that we do not know where the cavatinas come in, or what part of the noble old document is cut up into choruses. We suppose the moment Herr Wagner gets the news that he will try his hand on Rollin's Ancient History, or a book or two of Euclid; and, when the American gentleman is through with the Constitution, perhaps he will be good enough to set our Revised Statutes. Who knows but we may be on the eve of a total revolution in politics? Who knows but singing may take the place of speaking, or how soon honorable gentlemen will be choiring their sentiments, chanting the Yeas and Nays, calling to order in a fortissimo passage.

and moving the previous question in a cadenza? Until women are sent to Congress we think the pages might take the soprano parts; but how noble and convenient it will be to have a basso profundo for Speaker, thundering his commands above the confused roar of the House, and finally compelling it to come to harmony! Our own impression is that a man who can manage an opera—allay the storms, and pacify the squabbles of that institution, and keep the artists from pulling each other's wigs—is just the person to take the House in hand and coerce its restive spirits. New York has certainly made the nation a valuable present in the person of Mr. John Morrissey; but if the practice of sending fistic champions to Washington should become general, how nice it would be to have Mr. Maretzek or Mr. Grau to soothe the savage breasts!—*Vide Collins's 'Ode on the Passions,' passim!*

"The people are looking forward to the next meeting of Congress with the greatest anxiety. If we could only be sure of harmony—heavenly harmony! How beautiful it would be if the President would just step down to the Capitol and sing his Message! How it would soothe the agitating apprehensions of *The National Intelligencer!* Brass bands have helped to elect a great many members, and his Musical Majesty King Cole had a cabinet of fiddlers. We merely throw out the hint, and, if Honorable Members like it, let them pipe away!"

DURING the late session of the Legislature of Minnesota Judge M——, formerly of the Empire State, was in St. Paul, stopping at the Merchants' Hotel. In the evening it occurred to him that certain liquid comfort would not be out of place, and accordingly with a friend proceeded to the bar-room. A certain Federal functionary was standing at the bar, successfully transferring the contents of a black bottle into a tumbler. The Judge, a stranger to this Government official, remarked to his friend, "I'll bet that man is a Democrat"—speaking loud enough to be overheard.

The official, who has a slight impediment in his speech, replied: "You n-n-never was more m-m-mistaken in your life; I've g-g-got all the sy-sy-sym-symptoms, but n-n-none of the di-di-disease!"

THE great novelist of Scotland is still pleasantly remembered by the "representative" men of Massachusetts, if we may judge by a little thing that occurred recently in the House of Representatives of that commonwealth, when one of its members said, in making a quotation: "Now let us hear what Sir Walter Scott Bart says on this subject."

THE Drawer is non-partisan. It gives the good hits of all sides. The following, of our new Secretary of State, is not without point to those who know that gentleman and the refined hospitality that has always characterized him. It is related that some years ago he became involved in a business affair that gave him some trouble. He had many sessions with his counsel, and neither of them could see any way out of the difficulty except by a lawsuit. Finally a thought struck him, and as it did so he jumped from his chair so violently as to overturn it, struck

his heels together twice while in the air, and slapped his thigh so violently with his right hand as to raise a blister.

"Eureka!" he shouted.

"What is it?" asked the lawyer, who was surprised at this demonstration.

"I have it," replied the Knickerbocker. "I will invite them to dinner—my opponent and his lawyer. You and I will do the honors, and if we don't bring them to terms there is nothing that can."

The dinner was given, and worked to a charm. The affair was settled without recourse to the law, and Mr. Fish and the other party were ever after the best of friends.

Believing this story to be "founded," it goes upon the record.

THE March Number of the Drawer contained a stanza expressing the reluctance of the author to "dye in ortum." The idea may have been original with the gentleman who sent it, though the subject seems to have been previously treated by another child of the Muses, located in Foxborough, Massachusetts:

I wud not dye in spring-time,
And miss the turnup greens,
& the pooty song of the little frawgs,
And the skylark's early screams;
When birds begin their wooing,
& taters 'gin to sprout,
When turkeys go a gobbling—
I wud not then peg out.

I wud not dye in summer,
& leave the garden sass,
The roasted lamb and buttermilk,
The kool place in the grass;
I wud not dye in summer,
When every thing's so hot,
And leave the whisky jewlips—
Owe know! I'd rather knot.

I wud not dye in aurtumn,
With peaches fit for eating,
When wavy korn is getting ripe,
& kandidates are treeting.
Phor these and other reasons
I'd not dye in the phall;
& sense I've thought it over,
I wud not dye at all.

A CORRESPONDENT furnishes the following, in the architectural way:

I was staying overnight a short time ago at a public house which was put up in a remarkably brief time; in fact, its marvelous rapidity of construction vied with Aladdin's palace or George Francis Train's hotel out West—both of which I have at times thought somewhat mythical. A little dapper man accosted me in the corridor with:

"Will you tell me, Sir, what that sign is up there? I'm a little near-sighted myself."

I explained that it was "Wash-rooms."

"Oh!" said he, "the house has grown so fast I didn't know but what they were 'mushrooms.'"

I have always thought that that man must have been joking.

In one of the villages of Kentucky recently a Baptist minister and a young Presbyterian clergyman preached in the same house "night about," both preachers being present at each meeting. One evening the Presbyterian, after a discourse on Infant Baptism, proceeded to baptize several babes. The little candidates made a great out-

cry, which, of course, was noted by the Baptist man. Next day a number of the converts of the latter were to be immersed in the river near by. At the appointed hour a large concourse gathered on the banks, the Presbyterian being of the number, and standing close by the water's edge. After the candidates had been immersed the Baptist took hold of his Presbyterian colleague, and said:

"Now, Sir, I will immerse you."

The latter, amazed, demurred.

"Come along; I'm in a hurry!" replied the damp divine, and dragged his brother into the water.

Alarmed and indignant, the young Calvinist declared at the top of his voice that he did "not believe in immersion, was opposed to it, and would not submit to it."

The audience were much excited at the scene. The Baptist released his hold, and said:

"Young man, I will not immerse you to-day; but if ever again I see you baptizing little ones against their own will, and spite of their cries and kicks, as I saw you do last night, *I will dip you into the water as sure's there's a God in Israel! You bet! LET US PRAY!*"

WE can do no better than commend to Dr. Dalton and the members of the Health Board of this city the following official report of the county physician of — County, Illinois, to the Board of Supervisors. For clearness of style and succinctness of statement it may serve as a model:

To the Honorable Board of Supervisors of — County, Illinois:

I hereby respectfully submit my quarterly report of the sanitary condition of the — County Hospital for the Poor.

Remaining in hospital and upon farm at the close of last quarter	32
Received into hospital during the quarter ending March 1, 1869	10
Born in hospital	1
Discharged	10
Died	3

One of chronic diarrhœa; the other two from a *supposed* cause of one being eighty-two, the other one hundred and two years of age. The happy efforts of Mr. —, the Superintendent of the Poor Farm, in having all the inmates to conform to a strict sanitary and hygienic regulation procrastinating adolescence the spring-time of existence into longevity. Notwithstanding man's desire for life increases in exact proportion as it diminishes in value, even when all our enjoyments are at an end, we cling to the cup to the last, and drain it to its bitterest dregs, even then relinquishing it solely from inability to retain it any longer to our lips.

Still remaining in hospital and upon the farm, fifteen males and fifteen females, including children. Total, 30.

Respectfully submitted.

—, M.D., *County Surgeon.*

Not bad for a little girl of ten, whose knowledge of geography is somewhat imperfect: On hearing her father speaking of going to the *polls* to vote, very innocently inquired if the rebels at the South voted at the *equator*.

ARE there not those who will sympathize with the seven-year-old "boy of the period" as to the propriety of the final disposal of the objectionable party in the summary manner he proposes?

This boy, whom they were endeavoring to enlighten in that portion of the Shorter Catechism devoted to Justification, Sanctification, and Adop-

tion, after a few moments' reflection looked up to his paternal and said: "Papa, I do wish somebody would shoot the old devil and kill him, and then we wouldn't be bothered with all the trouble of learning the Catechism!"

YOUNGSTERS seem to know what's what, especially when "pap" has been taking too much overnight. The paternal, in the instance furnished to us, had spent the evening at a convivial party, and next morning had the compensating headache. "James," said he to his little son, aged eight, "go to the drug store and get me a bottle of soda-water."

The little boy proceeded to the druggist's, and, seeming to comprehend precisely the nature of the paternal ailment, said, "Please give me a bottle of *sober-water* for pa."

GOOD conduct at Sunday-school seems to be differently rewarded in different localities. In a certain Episcopal church in San Francisco, for instance, each scholar that is in his place before opening school receives a ticket for Punctuality. Our correspondent having, as was his habit, come early to school one Sunday, observed a class of six or seven boys, aged from seven to twelve years, all of respectable parentage, throwing dice for who should win the whole lot of Punctuality tickets. He stood aghast at such depravity, in such a place, on such a day—especially when one urchin roared out: "Sixes! I've won; *give us the pool!*"

Can Chicago excel this?

A WEST-POINTER sends us this, told him by the hero himself:

Small-pox was prevalent; doctors busy and in constant demand; vaccination, its merits and effects, were the theme of village talk. Sunday morning Georgie (the hero, then a boy) washed, combed, and Sunday clothes on, after having received injunctions not to pass such and such a house, started for Sunday-school. During the exercises the teacher asked Georgie if he had ever been baptized. Small-pox and vaccination happening to be uppermost in Georgie's mind, and being rather too young to know the difference between the sound of "baptized" and "vaccinated," and being ashamed to be thought ignorant, promptly and *rather* pompously answered: "Yes, Sir, I have been baptized five or six times; *but it never took!*"

A BOSTON matron, who thought it would be quite proper during the session of the Diocesan Convention of that State to give a subdued evening entertainment to the members thereof, sent to Mr. S—, the prominent caterer of the Hub, to assist in arranging the details. He asked if she intended to give a dancing party.

"Oh no!" she replied; "the company will be largely composed of clergymen."

"In that case, Madam," said he, "I would advise you to *provide bountifully: them pious eats dreadful!*"

THE Mayor of the city of St. Paul, Minnesota, is also one of the leading physicians of the place, and his well-known kindness of heart toward the poorer classes renders him constantly exposed to applications for succor and aid in both his pro-

fessional and civil capacities. The following choice specimen of *belles-lettres* was received by him the other day (the italics are ours—and the printer's):

St Paul June 5th 1868

Dr. —, i Just make my Distresses known to your Houner as Been a Poor Distitude *unhealthy* Poor Widow those 2 years under the Mercy of the Lord of Heaven & Doctors & My Daughter also & your Honour knowes that *your self* & my Son is of age those three years Past he is good & kind to me he helps me the Best he Can to keep a live & of Course a Boy of his age is inclind to Do for himself my House was moved in to a wet Place By this Donovan (?) & he Charged me \$48 Dollors a year for the weth of the little House When the Helth failid me i Could not Pay the Rent & he notified me to lave a gainst the 10th of June & my helth is Poor if your Honour Dont Do something for me i Dont kno *what a Do* if i got 5 or 6 Months to live here that is *all i want* (the Doctors tells me that i Cant live any longer)

I Remain Yours

Mrs — Widow

AFTER all, the outspoken, practical man is a necessity in those regions where it is necessary to "push things" to insure success. Example:

A young and enterprising merchant of Galesburg, Illinois, a great favorite with all classes, hands around one of the boxes in the Methodist Church. A few Sabbaths ago he came to a pew full of his wide-awake friends, who showed no signs of contributing. He then, in a whisper loud enough to be generally heard, said: "It's no use! I tell you, fellows—shell out! I know religion's free, but *it takes a heap of money to run the machine!*"

A NEW definition of the word Passover comes from Michigan, where a lady teacher in Sunday-school, not being precisely satisfied as to its meaning, requested the superintendent to enlighten her, which he did by saying that the word Passover referred to the time when the Children of Israel *passed over* the Red Sea.

If the following did not come to us from a most reputable firm in Cleveland, its authenticity might be open to doubt. Its only interest lies in the two concluding lines of a very familiar stanza.

A few days since, says our correspondent, we received from Ashtabula an order for a gravestone for an old gentleman who died at seventy-five, with directions to put upon it, under the usual personal inscription, the following:

"*Hear the old man lies*

No one laughs no one cries

Where he has gone or how he fares

No one knows and no one cares

But his Brother James and his wife Emeline
They was his friends all of the time."

Some consolation in that, at least.

A WASHINGTON letter-writer remarks of Mr. Greeley that "the control he has of his countenance is nearer what is related of Talleyrand than any man we wot of—it being said of the latter that if any man were to kick him behind, a man in front could not tell from the expression of his face that any thing unusual was occurring." This reminds a correspondent of an incident that occurred in Omaha: A gentleman who had received an insulting missive determined to resent it promptly. Next day, thinking he saw his man ahead, hastily overtook him, and administered several pedal salutations. The kickee re-

maining passive, the kicker went round in front to see the effect, and discovered to his regret that he had kicked the wrong man. He apologized, and was answered:

"Don't mention it. From the frequency of such little episodes in my experience I was sensible of your demonstration, but was *not* aware you had made any mistake."

At which little M——, of the Omaha *Herald*, admiringly remarked, "Oh, *hasn't he got the nerve!*"

You have doubtless heard, writes a Providence contributor, that Father Time has laid aside his scythe and mounted a mowing-machine, and that a railway has been thought of for the relief of pilgrims to the Great City; but I question if you have heard of the latest improvement. An aged colored auntie was doing the washing for a family occupying a part of the house with me, when as I stepped into the yard she was drawing a pail of water from the well by a wheel balanced with a large stone.

"Ugh! pooty way dese folks has for gettin' water; and dis ere horrid wheel!" and she spluttered away as she tugged at the chain.

"But it's pure when you get it," said I. "But, auntie, do you draw water from the well of Salvation?"

"No, Sah," replied she, indignantly; "no, Sah, *we has pumps!*"

A PENNSYLVANIA newspaper man, appreciating the moral value of the Drawer, contributes this:

Squire B. B——, of Pleasantville, was appointed an agent of the United States Government some three years ago, and ordered to Southwestern Minnesota, with instructions to build a saw-mill and grist-mill for Mr. Lo, the Poor Indian. (You will see the mills marked on Mitchell's New Atlas, in Redwood County, Minnesota.) After a year or so had elapsed the Department sent out another agent to look after things and report progress. The latter visited B. B——'s district, and found that the dam only had been completed. He reported that he had examined things in B. B——'s Agency, and found a dam by a mill site, but didn't see any mill by a dam site.

MANY years ago one of the Boston insurance companies had an important case coming on, involving a large sum of money, and the solicitor of the company, Mr. —, thought it advisable that Mr. Webster should be retained. The president of the company coincided, and handing him a check for one thousand dollars requested him to call upon Mr. Webster and secure his services. He did so, paying him the money; but it happened that the case was amicably settled. Some time afterward, at the suggestion of the president, Mr. — called upon Mr. Webster to inform him that the case would not come to trial, and that the retaining fee should properly be returned to the company. Mr. Webster was amazed. Turning round to Mr. —, he said: "You are a lawyer, Mr. —, and know, or certainly ought to know, the meaning of *retainer*. It comes from the Latin *retineo*—*retineo*, *retinere*, *retenti*, *retentum*; which means to retain—to retain; and I mean to retain it!"

No. CCXXX.—JULY, 1869.—VOL. XXXIX.

EARLY AERONAUTICS.

FIRST ATTEMPT AT MILITARY AERONAUTICS.

THE obstacle for man in the way of his acquiring the art of flying is not the difficulty of *constructing wings*, but that of obtaining the necessary force to work them. Birds are provided with muscles of large size, packed in their breasts, which are capable of exerting an enor-

Entered according to Act of Congress, in the year 1869, by Harper and Brothers, in the Clerk's Office of the District Court of the United States, for the Southern District of New York.

BESNIER'S SYSTEM.

mous force—that is, enormous in relation to the size and weight of the body of the bird. By means of these muscles she can strike the air with her expanded wings so energetically as to lift herself from the ground by them, and then to impel herself through the air. If the arms of a man could be invested with an equal power in proportion to the weight of his body, any respectable mechanic could easily adapt an arrangement to them for expanding the surface, so that he could raise and propel himself as easily as any bird.

Thus the trouble is not, as many people have supposed, in *making wings*, but in obtaining the strength to work them.

Perhaps the most ingenious of the plans devised for furnishing man with wings was that of Besnier, a dextrous locksmith who lived in the province of Maine, in France, nearly a century ago, and who was quite distinguished in his day for his mechanical skill. His contrivance consisted of a double pair of wings, as seen in the engraving, to be worked by both hands and feet. The wings on each side were connected together by a stiff though slender bar of wood, the centre of which rested on the shoulder, as its pivot, in such a manner that the two ends, with the wings attached to them, could be brought down alternately by the action of the hands and feet. Each wing was formed of two leaves, which were hinged to the bar in such a manner as to cause them to open and present a large surface to the air in coming down, and then close again in going up.

The contrivance is ingenious enough, and might have succeeded were it not for the want of strength in the arms and legs of any man to work it with force and rapidity enough to make it effective. If we simply look at the figure, and make a mental estimate of the weight of the man, and of the prodigious power and rapidity of the impulses with which such wings

must strike the air to lift and propel him, we shall see at once how totally inadequate the human strength must be to perform such a work.

It is said that Besnier did not really expect that he could raise himself from the ground and fly at will through the air by means of this mechanism, but only that, by starting from some elevated place, he could make a kind of fluttering which would have the effect of protracting a little the time of his descent to the ground so as to amuse spectators at a fair or at other country gatherings. At any rate this was all that he accomplished by his contrivance, and it is very probable that it was all that he aimed at.

The difficulty in the way of navigating the air by means of balloons is substantially the same as in the case of wings—the want of *power*

to *propel* the balloon. Many persons have imagined that the difficulty is in *steering* it; and a great many inventions and contrivances have been brought forward, from time to time, for overcoming this imaginary obstacle. But the difficulty is not in the want of means to direct, but of force to propel. If there were a force at our command adequate to drive such a mass as a balloon *in any manner* through the air there would be no difficulty whatever in giving its course any direction that might be desired. But if we had such a force at our command in the air the balloon would be of no use. The best thing that could be done in that case would be for the operator to cast off the immense encumbrance of the bag of gas, and force his way forward, wherever he wished to go, by means of compact and appropriate mechanism.

It is probable, however, that the schemers who have been endeavoring to discover a mode of navigating the air, when they speak of *steering* the balloon, really mean, not merely putting the head of the machine, so far as it has any head, in the right direction, but to include also the making it move on in that direction—which last is really a very different thing. A boat may be headed in any direction by means of an oar at the stern, but whether she will move forward in the line on which she is placed depends not at all upon such steering, but upon there being a *propulsive force*—whether of wind, or water, or oars, or steam—to drive her forward in the direction determined by the oar.

The attempts made to contrive some means to enable man to fly were long anterior to the invention of the balloon, and amidst innumerable failures there were some cases of what might be considered partial success. The famous Blanchard, whose name is so celebrated in the history of aeronautics, after many fruitless attempts to construct wings, by means of which he could raise himself from the ground,

BLANCHARD'S COUNTERPOISE.

determined at last to contrive the means of measuring the degree of approximation that he attained. So he constructed an apparatus for taking off a portion of the weight of his body, by means of a counterpoise, and then undertook to overcome the gravitation of the rest by the action of wings, formed like parachutes, to move vertically, and to be worked by the combined action of his legs and his arms.

The two pulleys over which the cord passes, as seen in the engraving, were supported at a great height by means of a tall mast, not shown. By means of this arrangement, and a counterpoise of *twenty pounds*, Blanchard succeeded in raising himself eighty feet from the ground. Of course, what he really lifted was the excess of the weight of his own body over that of the counterpoise.

As soon as the discovery of the balloon was made, in 1783, Blanchard at once thought that the whole question was solved. The great difficulty, as he understood it, had been the work of lifting the aeronaut from the ground—in other words, the overcoming of the force of gravitation. This work could now be readily accomplished by the balloon. The navigator being once lifted into the air by this means, he supposed that it would be very easy to produce motion in any required direction by means of wings.

He forgot, it seems, that though the balloon might lift the navigator into the air, its vast bulk would occasion an enormous resistance to his motion through it after he was lifted. In a calm the attempt of a man to draw a balloon after him through the air, with any wings which he would have the strength to manage, would be something like his undertaking to tow a ship by swimming before it,

and paddling with his hands; and in a gale his power to control the force with which it would be swept along the sky, or even to retard its motion, would be about equal to his ability to stop the progress of a ship going before the wind with all sails spread, by such resistance as he could make in a small boat at the stern, by flapping an umbrella!

The cases would be very different, it is true, in relation to the *nature* of the antagonistic forces, but much the same in regard to the proportion between them.

Blanchard, however, not taking this view of the case into account, concluded that, although he had found that he could not lift himself

from the ground by means of wings, yet if he had a balloon to lift him he could make them effectual in enabling him to fly. He studied the subject carefully, and some of his drawings are still extant, though all his attempts to carry his plans into effect resulted in absolute failure.

The adjoining engraving of one of his plans illustrates his ideas. The wings by which the whole apparatus, balloon and all, was to be pro-

BLANCHARD'S FLYING BALLOON.

pelled, were to be worked from the car—or as it was then called “the boat”—which was suspended below. Between the balloon and the car was the parachute—a contrivance in the form of an umbrella, which was intended as a safeguard, to let the car down gently to the ground in case of any accident to the balloon.

The history of the origin of the parachute, and of the gradual development of the idea, is very curious. The invention was one of the results of that prodigious intellectual activity in the search for novelties of every kind, which so strongly characterized the people of France, and especially of Paris, in the years immediately succeeding the first French Revolution. The chief inventor of the parachute is generally considered to be Sebastian Lenormand, then residing in Montpellier, a city in the south of France, near the mouths of the Rhone. He had read in books of travels that in some part of the world there were performers among the people who were accustomed, for the amusement of the king, to jump from heights, with an instrument like an umbrella held over their heads to retard their fall. He determined to try the experiment. His first trial was made with two umbrellas, one held in each hand. He chose umbrellas of the largest size, and strengthened them by additional ties within, to prevent their being turned inside out by the resistance of the air. With these in his hands he leaped from the second story of a house, in Montpellier, and came to the ground in safety.

Some one who witnessed this experiment reported it to the Abbé Bertholon, who was at that time a professor of Natural Philosophy at Montpellier. He was much interested in the idea, and sent for Lenormand. Lenormand proposed to repeat the experiment in a new form. He obtained a large umbrella, one about thirty inches in diameter, and suspended a number of animals to it, one after another, and let them fall from the top of the observatory. They all came to the ground in safety.

Lenormand then made a calculation, from the weight of the heaviest animal that he let fall in safety from the tower of the observatory, compared with the size of the umbrella, to determine what must be the magnitude of an expanded surface sufficient to sustain a man. He found that an umbrella about fourteen feet in diameter would be required to retard sufficiently a weight of 200 pounds, which was his estimated weight of the man and of the apparatus, which last would of course be pretty heavy, on account of the necessity of giving great strength to all the parts. He concluded to give the name of *parachute* to his contrivance. Parachute is a word of French construction, equivalent in signification—so far as it can be expressed in an English fashion—to *counterfall*.

When his parachute was finished Lenormand, after some minor trials, leaped with it himself from the top of the tower of the observatory in the presence of a vast crowd of spectators, and came down safely to the ground.

Among the spectators who witnessed the experiment was Montgolfier, the inventor of hot-air balloons, which for a long time were greatly used, and were called by his name, though the hot air has since been almost entirely superseded by hydrogen gas. He at once perceived the importance of this invention as a means of adding interest to the aeronautic exhibitions that he was accustomed to make for the amusement of the people of Paris, and he immediately adopted it. Blanchard also, who used balloons filled with gas, exhibited the parachute in his performances, by letting small animals, such as dogs, rabbits, hens, and cats, fall from great heights in the air.

There were a great many of these public exhibitions of the balloon in its various forms in Paris in those days. The invention itself being novel, and the spectacle being very imposing, it was very natural that the attention of the people of Paris should be greatly excited by the ascensions whenever they took place. Then, besides, very great expectations were entertained in those days in respect to the benefit to be derived from the invention when it should be matured, and multitudes of schemers and projectors appeared with plans by which all difficulties could be removed, and the art of navigating the air made practically useful.

The engraving represents one of these scenes. The balloon is one of the kind called a Montgolfier, that is, one filled with rarefied air, as is evident from the large orifice below, and the smoke issuing from it. In balloons of this class the place for the persons ascending was in a little gallery formed around the orifice.

Whenever an inventor conceived a new idea his first object was to make a public exhibition of his plan, partly in order to obtain funds to aid him in perfecting it. Thus the parachute was exhibited as a new invention; at first, however, only animals were intrusted to it; but in all cases it let them down gently and in safety to the ground.

Among the spectators who witnessed these performances were two men of considerable political standing, who afterward, being sent at different times to the army of the Republic, on the northern frontier, with commissions from the Convention, were each taken prisoner by the allied armies then fighting against France, and confined in fortresses, and who conceived the idea of escaping from the walls of their prison by means of some sort of parachute similar to those which they had seen exhibited in Paris. One of these, whose name was Jacques Garnerin, and who was confined in Hungary, was betrayed by the persons whom he employed to procure the materials for his parachute, and his design was thus discovered before he was ready for his attempt. The other, whose name was Drouet, and whose prison was the castle of Spielberg, in Moravia, attempted to manufacture a parachute out of the curtains of his bed. He succeeded in finishing it, and when the time came he leaped with it from a lofty embrasure.

PUBLIC ASCENSIONS IN PARIS.

But he broke his leg in the fall, and was thus retaken and returned to his confinement. Both these prisoners were, however, exchanged before a great while; and one of them, Jacques Garnerin, afterward distinguished himself by some remarkable performances with real parachutes, as we shall presently see.

It is a curious fact that almost all great inventions are preceded by imperfect, partial, and more or less abortive attempts, involving the same principle, which seem to foreshadow the discovery, as it were, and often give rise to protracted disputes in relation to the true origin of it. This was strikingly the case in regard to the parachute; for a prisoner did actually make his escape by means of a large umbrella to lighten his fall more than twenty years before the time of Lenormand's experiments.

His name was Lavin. He was confined, however, not as a prisoner of war, but as a criminal. His crime was forgery.

He was a remarkably skillful penman, and his extreme dexterity in the use of his pen, and the facility with which he could imitate any writing or printing, tempted him, it seems, to counterfeit certain Treasury certificates—the greenbacks, in fact, of those days. He was convicted of the crime and imprisoned, and he occupied himself in his prison in executing certain specimens of penmanship so wonderful that they were afterward publicly exhibited as almost worthy of being considered works of art. They consisted of portraits of public men, and of high officers of state, whom he hoped in this way to interest in his favor, so as to procure his release and pardon. These performances were

the more remarkable from the fact that they were executed with pens which he made from stalks of the straw furnished him in his cell.

These ingenious efforts failing to procure his release, he determined to release himself. The window of his room in the tower in which he was confined overlooked a river, on the banks of which the castle was built, and he determined to make his escape by leaping from the window into the water with an umbrella in his hand. He concluded that the umbrella would materially check the rapidity of his descent, and that if he should acquire too great a velocity, the water would break the force of his fall.

The experiment succeeded. He fell to the water and sank into it without injury. As soon as he rose to the surface he swam to the shore and escaped. The poor man was, however, afterward retaken, and was kept in close confinement for the rest of his life. It is difficult not to experience a feeling of regret at his recapture. And yet the counterfeiter attacks the most vital interests of society by weakening the confidence of men in the authenticity of the written signature, and thus undermining the foundation on which all the great transactions of civilized life are based. He is, moreover, in one sense the greatest of criminals; for he has not either of the two great pleas which may be offered in mitigation of crime—urgent want or sudden passion. He must act calmly and deliberately, for his work requires it. He must have talent, and ability to earn a livelihood in an honest way. His work proves it.

Although Jacques Garnerin, the first of the two prisoners already referred to, was prevented from carrying out his design of escaping from his prison by means of a parachute, he did not dismiss the subject from his mind, but resolved that as soon as he was released he would make the experiment on a grand scale, to show what he would have done in his prison if he had not been betrayed.

He was released in 1797. In the fall of that year he carried his plan into execution. He caused a balloon to be constructed and a parachute to be attached to it. The parachute was folded, but so arranged that the resistance of the air should open it as soon as it should commence its descent.

The place chosen for the experiment was a large open piece of ground on the outskirts of Paris. A large number of spectators assembled to witness the daring feat of a man's letting himself drop from the clouds, and come down to the ground, with only a big umbrella over his head to lighten his fall.

The people gathered around the spot, and looked on in solemn silence while the preparations were made. The balloon was inflated, the parachute, folded, was attached to it. A small car was beneath. There was a cord which descended from the balloon to the car, by cutting which the aeronaut could sunder his connection with it, and let himself and the para-

chute fall. There was also an arrangement by which the gas should be liberated from the balloon at the same time, so that it might also descend to the ground and be recovered.

The fearless adventurer allowed the balloon to ascend until it reached a height of about 3000 feet, more than half a mile. The people below watched the progress of it with intense interest and in solemn silence. At length they saw the parachute separate itself from the balloon, and begin to fall. It soon expanded, and at once began to sway to and fro from one side to the other in frightful oscillations, which, when it had descended far enough to bring the little car in sight, were seen to jerk the car so violently from side to side as to make it very difficult for the man to retain his place. At the same time the balloon turned over on its side, began to collapse, and to follow the parachute in its fall. Both together drifted away before the wind, and so descended to the ground. The balloon reached the ground first.

The car struck the ground with some violence, but without doing Garnerin himself any injury. His balloon had, however, drifted so far by the wind that he was now at some distance from the place where he made the ascent. So he at once mounted on horseback, and rode back with all speed to carry to the crowds of spectators the intelligence of his having accomplished the descent in safety. He was very fortunate in having escaped so well; and, considering the vast height from which he fell, the absolute novelty of his situation, and the terrific surgings of the car as it swung to and fro in the air, we may perhaps consider this descent as one of the most frightful voyages ever made by any human being.

Garnerin obtained great celebrity by this and by some other aeronautical exploits, and as balloon ascensions became soon after this objects of such general interest among the people that some spectacle of the kind became almost an essential part of the celebration on all days of public rejoicing, the government created an office for the superintendence and management of these spectacles, and Garnerin was appointed to fill it. He retained the position of government aeronaut for many years.

A great number of ascensions were made by different performers during those years in safety, but in some cases they led to the most disastrous results. One of the most terrible of these accidents was that which resulted in the death of Madame Blanchard. Her husband, who has been already referred to in this article, was one of the most intrepid and most successful aeronauts of his day. Indeed, he acquired a large fortune by his public exhibitions. He made more than sixty ascensions in all, one of which took place in New York. He received large rewards from the government for certain discoveries and improvements that he made.

At last, however, he became involved in some political complications, in consequence of which he lost all his property, and was re-

GARNERIN'S DESCENT.

duced to such a state of destitution that he told his wife on his death-bed that she could have her choice of hanging herself or drowning herself after he was gone, but that that seemed to be all the choice that would be left to her.

She, however, after his death found that she was not inclined to accept either alternative. Instead of this she resolved to adopt and carry on her husband's profession, which she did with great success. She made a great many ascensions and acquired extraordinary skill; and she became at last so intrepid that she exposed herself to the greatest dangers. This of course only increased the interest which the public felt in her ascensions and added to her profits.

She met with many extraordinary adventures, and had several hair-breadth escapes.

At one time she lost the control of her balloon and it came down with her into a bog, where it got caught among the trees and was dashed about with great violence, while there was no firm ground on which she could stand. It was thought that she must have perished if some of the country people living near had not come to her aid.

She made between fifty and sixty ascensions, varying them by a great number of different exploits which she performed in connection with them, until at length, in 1819, she conceived the idea of letting off fire-works in the skies for the amusement of the people at a fair in Paris. The fire-works were what are called Bengal lights. They were attached to the balloon in such a manner that Madame Blanchard from her car below could reach them by means

DEATH OF MADAME BLANCHARD.

of a long pole with a torch at the end of it, and then detach them so that they might fall burning through the air watched by the people below.

That any person should conceive the idea of ascending several thousand feet into the air by means of an immense volume of one of the most combustible substances known, and contained in the thinnest possible envelope formed of a substance scarcely less combustible, there to set off fire-works by means of a torch at the end of a pole, and that person a *woman*, would seem to be one of the most desperate conceptions that could possibly enter a human brain.

As might have been anticipated, by some want of steadiness in hand in holding the long pole, or by some sudden and unexpected swaying of the balloon or of the car, the fire, either from the torch or from the fire-works, reached

the hydrogen, and the lower portion of the balloon was immediately enveloped in flames.

The balloon began immediately to descend very rapidly. The cords by which the car was attached to it were burned off, and Madame Blanchard was thrown out and fell upon the roofs, and from the roofs to the ground. She was killed upon the spot.

In some respects the most remarkable ascension that ever took place was one made by an apprentice boy of twelve years old named Guerin, who was taken up by the action of the balloon itself without his consent, and without any intention that he should go up on the part of any other person. It was a rarefied air balloon. The car was in the form of a boat, and was to be suspended from the balloon by cords attached to each end of it when the balloon was

filled. There was also an anchor suspended by a cord from the bottom of the boat, which was intended to catch upon the ground and hold the balloon when it should come down.

After the balloon was filled and was ready to go up some of the assistants held it by cords, while others went to work to attach the car to it. They had secured one end, and were then going to secure the other, when, by some means or other, the balloon broke away from those holding it and began slowly to rise, and at the same time to drift along with the wind, dragging the car and the anchor over the ground. It happened that, as the anchor was thus drawn along, and was beginning to rise, it passed so closely over this boy—who was sitting quietly near by with his companions, not dreaming of being any thing but a spectator of the proceedings—as to catch the fluke in the waistband of his pantaloons, and as it continued to ascend it took him up with it.

The boy uttered piercing screams and cries and calls for help; and there was, perhaps, no harm in this so long as he held on bravely. Of course no help was possible except calls to him from below to hold on. He found that the waistband began to give way, and he instinctively grasped the rope above his head with both hands, and so sustained himself. The strength of his hands, without the aid of the hook in his waistband, would not have been sufficient to sustain his weight many minutes; and the waistband was not strong enough without the hands. Both together, however, answered the purpose.

It was very fortunate for Guerin that it was a Montgolfier, that is, a rarefied air balloon and not one filled with hydrogen, that was running away with him; for in the latter case the gas within would have continued to expand as the outside pressure upon it diminished by the increasing elevation; and as there would have been no possibility of opening the valve, as is usually done, to relieve it, the balloon would have burst and collapsed, and the poor boy would have fallen a thousand feet or more to the ground with full force. But being a Montgolfier, the ascending power gradually diminished as the air grew cool, until at length, after floating a moment in equilibrium, it began slowly to descend. As the balloon descended, the rope which had begun to untwist under the influence of the boy's weight, turned more and more rapidly; and inasmuch as a person suspended from a balloon is never conscious of his own motion—the illusion which makes the motion seem to be in the earth and not in the balloon being perfect—as it is indeed on a smaller scale to a person going up in the elevator of a hotel

—it appeared to Guerin that the earth was spinning round beneath him in a vast and most frightful gyration. Guerin was more terrified than ever. As he drew near the ground, or rather, as it appeared to him, as the ground and the concourse of spectators upon it came whirling up to him, he cried out to the people to save him. They called to him in reply not to be afraid, that he was all right; and, receiving him in their arms as soon as he came within reach, they at the same moment stopped the spinning of the earth and unhooked him from the anchor.

The incident of course created a great sensation at the time; and, as the account of it became a part of the history of aerostation, the story will be repeated in all coming time. Guerin found himself very suddenly famous. As

YOUNG GUERIN TAKEN UP.

PHILOSOPHY IN THE AIR.

he was only in the air about fifteen minutes, it is very probable that this boy acquired historical immortality at an earlier age, and in a shorter time, than any other human being.

Notwithstanding the high hopes which were entertained at the first invention of the balloon, that the system, when developed, would become the means of rendering great service to mankind, and which are still entertained by many people, no results have yet been realized of any serious importance; nor is there any present prospect that any ever will be realized. The balloon has been from the beginning little more than a philosophical toy, although it must be confessed that it is a very grand and imposing one. The difficulty is simply the want of power, and the seeming hopelessness of obtain-

ing the means of procuring, in the air, any *great power with little weight in the appliances to furnish it and employ it.* Where we see that we have power, or have a source at our command from which we can procure it, there is no limit to the hopes we may entertain in respect to the objects, however complicated or difficult, which may be accomplished by it. Man can and does make *fire sew.* Fire is power, and through the intermedium of the steam-engine and the sewing-machine he can make it sew, or do any thing else, however intricate, for which he can devise the proper means of applying it. But he can not make the lightest wheel turn itself, or one force overcome another, in the smallest degree greater.

When man can contrive a way to take heat

enough into the air, in connection with mechanism so light that the power of the heat can lift and operate it, then, and not till then, so far as we can now see, will he be able to navigate the air.

Many attempts have been made to derive some practical benefit from the use of the balloon in various ways. Among these the one which has most nearly attained success is the use of it as a means of making reconnoissances in time of war. Attempts to employ the balloon in this way were first made by the French Government, in the time of the first republic. A regular aeronautic corps was organized, and a system of drill and of signals established, and other arrangements devised by means of which ascensions could be made by a reconnoitring party, information communicated to the commanders below, and the balloons, ready charged, be transported from place to place, wherever they might be required. The engraving at the head of this article represents a body of men in those days manœuvring a balloon in the field.

The operation of the system was, however, attended with so many practical difficulties, and the results were so uncertain, that it never became established as a regular element in the art of war. One of the chief sources of embarrassment was the trouble of transporting so cumbersome a mass as an inflated balloon across the country. To empty the balloon when it required to be moved, with a view of refilling it where the next ascension was to be made, would have very partially remedied the difficulty, as it would have rendered it necessary to transport the chemical apparatus and materials for producing the gas, and involved the difficulty, uncertainty, and delay of a tedious chemical process at every station from which a reconnoissance was to be made.

The use of the balloon was attempted to some extent in the late war in this country, but with no very conspicuous success.

The balloon has, however, been made practically useful in a certain sense—or, rather, it has been made practically conducive to the attainment of theoretic ends—by being employed as an instrument of scientific investigation. The engraving opposite represents an ascension made by Gay Lussac and Biot, two distinguished French philosophers. The special object of this expedition was to determine certain questions in respect to certain phenomena of electricity and magnetism, as affected by distance from the surface of the earth. The nature of these questions, and the results which the philosophers obtained, can not be here explained. The results were somewhat unexpected, and were of great importance, and the ascension formed a memorable event in the history of science. It was one of the first of its kind, though many others of a similar character have since been made.

Every one is familiar with the toy hydrogen balloons, so common at the present day, formed by inclosing hydrogen in a globular bag, con-

sisting of a thin film of caoutchouc. The defect of this arrangement arises from a difficulty which greatly embarrassed the French engineers in their attempts to employ the balloon for purposes of war, and that is, the incapacity of the film of caoutchouc to prevent the transpiration of the gas through its pores. Hydrogen is of so extremely subtle and tenuous a nature that it is impossible to find any thin and flexible substance which will long contain it. The balloons of the French army were made of silk or cotton textures, and thoroughly varnished; but the gas would ooze through. It was said that they at last discovered a remedy for the difficulty, but that the remedy was afterward lost.

It is not difficult for any ingenious young persons to construct a toy Montgolfier, or hot-air balloon, to be filled by the heated air ascending from a lamp or from a gas flame, and made to ascend to the ceiling. The best material for a balloon of this size is tissue paper. It ought to be nearly or quite three feet in diameter, which would make the circumference nine feet, and the gores on each side four and a half feet. But as the gores, instead of coming to a point at the lower end, may be shortened there, and made square, to allow for the opening for the admission of the hot air, four feet will be long enough. About this length can be obtained by dividing each sheet of paper into two parts, and pasting them together, end to end.

From the long sheets thus obtained the gores can easily be cut, a pattern being first made in stiff paper. The general form of the gores is shown in the engraving. The precise form, except so far as having them all alike is concerned, is not material, unless it is desired to make the balloon perfectly spherical, or to give it some other precise determinate character.

FORM OF THE
GOES.

When the gores are cut the first is to be placed upon a table, and the second laid upon it in such a manner that the edge of the lower one on one side, say upon the *right* side, may project about half an inch beyond that of the one above it. This edge is then folded over and pasted down upon the other. The third gore is then to be laid on, and placed in such a manner as to leave the *right*-hand edge of the second projecting beyond that of the third, and this edge must then be folded down and pasted. In the same manner all the gores in succession are to be laid on and pasted, alternately, on the two sides. When the last gore is reached, which must be one to be pasted on the *right* side, and must be made somewhat wider than the rest, the left-hand edge, after the right-hand edge is pasted, must be carried around

HEROIC SELF-SACRIFICE.

under all the other left-hand edges, and pasted to the left-hand edge of the first one.

Thus the balloon will be completed, and as thus completed it will lie folded upon the table. During the process of pasting, however, a short piece of twine, or narrow tape, should be inserted in each seam, at the top of the balloon, in such a manner that the ends may project about six inches or more above, to be afterward tied together to form a loop by which the balloon may be suspended. A continuous tape is also to be put along the lower edges of the gores, and pasted there by folding the edge over it. This tape is to strengthen the border of the orifice left at the bottom for the admission of the hot air.

The balloon, when thus complete, is to be

held suspended by means of a pole, and then opened a little by inserting the hand under it below. It is then to be cautiously held over the lamp or gas flame, or other source of heat, taking care to hold it at such a distance above as not to endanger it. As the hot air ascends into it the top, supported by the pole, must be gradually lowered, to allow of the swelling out of the sides of the balloon. When it is found to be sufficiently full to sustain itself the pole is to be withdrawn, and the balloon held by means of the tape forming the circumference of the orifice, or by cords previously attached to it for this purpose. When it is released it will mount to the ceiling, if the experiment is made in a room, and a great deal higher if it is tried, on a calm day, in the open air.

Its flight may indeed be considerably protracted by attaching to it, below the orifice, by means of wire, a sponge saturated with alcohol, and then setting the alcohol on fire just as it is about to commence its ascent.

We close this discussion by narrating an incident which occurred in London in 1824, and which belongs rather to the realm of sentiment and romance than to that of science and philosophy. There was an exhibition of a balloon ascension to be made by an English aeronaut named Harris, at Vauxhall, a celebrated public garden. Harris, to give greater *éclat* to the spectacle, invited a young woman to whom he was engaged to be married to accompany him. The departure and the ascent were accomplished without any difficulty; but when high in the air the cord communicating with the valve at the top of the balloon, used for discharging any excess of hydrogen, or the valve itself, became disarranged, so that Harris, after opening it when he had reached the proper altitude, in order to prevent any farther ascent, found, to his consternation and horror, that he

could not close it again. Of course, as the gas continued to issue from the opening, the balloon descended with greater and greater rapidity every instant. Harris threw out all his ballast, and every thing else that he could lay hand upon, to arrest the descent. He took off his own and the lady's outer clothing, and threw it over. All was in vain. He finally concluded that by throwing himself over he might save her, as the balloon might perhaps have buoyancy enough left to sustain the weight of one. He accordingly kissed her farewell, and leaped into the air. She saw him go down, and immediately fell fainting into the bottom of the car.

When she came to herself she found herself in the midst of a crowd of eager spectators, some pressing around her to see, others doing all in their power to revive and to support her. She soon recovered sufficiently to be taken home, and she sustained no permanent injury from her awful adventure.

It is needless to say what was the fate of her devoted and heroic lover.

BORDER REMINISCENCES.

By RANDOLPH B. MARCY, U.S.A.

I.—PERSONAL REMINISCENCES.

IF any other argument aside from the almost universal opinion of mankind were required to prove that the reality of occasional events in life is more striking, and sometimes, indeed, more marvelous, than pictures of fiction drawn from imagination and fancy, it is believed that the sketches which the writer proposes to present to the reader under the above heading, every word of which is vouched for as literally true in every particular, will be sufficient to establish the maxim beyond cavil.

In passing from the southwestern borders of Kansas into the outer settlements of Missouri and Arkansas a sudden and complete transformation is observed, not only in the habits and customs of the people, but in the appearance of all their surroundings.

For example, in the former State churches and school-houses have kept pace with the pioneers, and are seen among the remotest hamlets. The children here go to school, newspapers are taken and read, and there is an air of thrift and comfort about the most primitive log-tenements that marks the Eastern origin of their occupants. While along the frontiers of the latter States a church or school-house is seldom met with, and it is rare to find a person here who has received the first rudiments of education. The schoolmaster and parson are strangers in those parts, and if they were to make their appearance they would be regarded as superfluous members of society.

These people are so local and circumscribed in their sphere of life, and so seldom meet with educated persons, that the English language

has suffered a very considerable metamorphosis under their vernacular manipulations—so that many of their conventional idioms have become as remote from the teachings of our standard lexicographers as the provincial patois of southern France is from the pure dialect of Paris.

Upon a hot and sultry summer's day in 1852, as I was journeying on horseback over "Boston Mountain," by the road leading from Arkansas to Missouri, I became wearied and thirsty, and riding up to the door of a wretched shanty (the intervals between the logs of which might well have entitled it to the appellation of "Oak Openings") I accosted a haggard-looking old woman who was in possession of the premises, and whose smoky, dessicated visage gave her a striking resemblance to my conception of Scott's Meg Merrilies, and I expressed the hope that she was in the enjoyment of perfect health.

At this salutation she raised her dim, glassy eyes upon me, and, in a most doleful tone of voice, replied:

"Wa'al now, *straanger*, I'll tell ye what's the matter: I war middlin' sort o' pert yesterday, but, sure's yer born'd, I'ze powerful weak today. Jist about sun-up this mornin', maybe a lee-tle bit afore, I war tuck with a almighty mizzery in the inards, an' I'ze been *a-squrmin'* an' *a-kavortin'* an' *a-howlin'* ever since" (putting special emphasis upon the italicized letter *a*, and inhaling her breath while she was giving it protracted utterance), "and I'ze swallered cords of apple-jack and tobaccer-juice; but, *straanger*, 'tain't no sort o' use, it don't begin to knock it, an' it's gotten wosser an' wosser all the time." Then spasmodically clasping her long bony fin-

"LIGHT STRAANGER!"

gers around the region of the stomach, and dropping her lank body upon her knees, she belched forth an unearthly screech of agony, but instantly jerked back to an upright position, and, in a sharp, authoritative tone, said: "Light, stranger, an' have a char."

I dismounted, accepted the seat, and condoled most sincerely with the poor woman, suggesting to her that possibly the tobacco and liquor might have had the effect of increasing her troubles.

She said no, that when these remedies would not "kill pain" "all the yarbs in Rackinsack (Arkansas) wo'dn't do it."

After the "mizzery" spasm had passed off I inquired where I could find a drink of water. "Thar war plenty water in the spring," she said,

but added, that "she rec'on'd she had some buttermilk in the spring-house, an' she 'low'd that buttermilk war a heap more wettiner nur water."

In accordance with the suggestion, I drank copiously of the liquid, and felt so much refreshed after it that I cheerfully indorse her opinion in regard to the relative "wettin'" qualities of the two fluids.

II.—SAM HOUSTON.

Speaking of buttermilk reminds me of an anecdote I once heard of General Sam Houston, who was a lover of this lacteal beverage, as many of the good housewives in the Southwest can vouch for.

Before the annexation of Texas to the Union,

and when it was an independent republic, with the General at its head as President, the incident I am about to relate occurred.

But in order to get a proper appreciation of my story a few observations upon the anomalous condition of society in that then remote and wild region may not be malapropos.

The inducements held out by the Mexican Government for the early colonization of Texas brought together men from every State in the Union, and indeed from almost every part of the civilized world; and it is perfectly safe to assert that probably no other locality in the universe was ever populated by a community made up of elements more heterogeneous than this. It is very true that there were some highly intelligent and respectable people among them, but the great mass of the early pioneers were of a very different stamp.

Men of desperate fortunes, who had nothing to lose and every thing to gain, went there. Ambitious adventurers, who sought excitement and preferment, here found a rich field for the indulgence of their proclivities. Besides these an army of refugees from justice, under assumed names, here found a secure retreat from the pale of the law. Such, in short, was the population that declared the independence of the republic, and placed General Houston at the helm of its government.

There never was much unanimity of sentiment among the early politicians of Texas, and even General Houston had a powerful party arrayed against him, which for the most part was made up of highly turbulent and reckless elements—men who gave expression to their opinions regardless of consequences, and frequently enforced them with their bowie-knives and revolvers in total defiance of law or order.

The non-enforcement of law rather served to encourage this disordered condition of society, and it was seldom that a jury was impaneled that dared to convict a man of murder, even when the crime had been perpetrated with the most diabolical malice prepense.

These same audacious spirits did not, however, for a moment hesitate to enforce Lynch-law upon a man for stealing a horse, or for putting his brand upon a neighbor's calf or colt.

The consequence of this was that individuals often took the law into their own hands as the only remedy for the redressment of their grievances, so that but few of the early settlers who remained in the country any great length of time escaped a duel or a street encounter, and many lives were sacrificed in this way. It is, therefore, a matter of surprise that General Houston, who continually occupied exalted political positions during a long period, should have escaped entanglement in those broils.

Whatever his enemies may have said of him, his friends regarded him as a man of most indomitable firmness of purpose, and one whose moral and physical courage were beyond question. General Jackson, who was his firm friend through life, pronounced him a brave man and

gallant soldier. Indeed he received a severe wound in the arm while fighting under General Jackson at the battle of the "Horseshoe." Nevertheless it is said that, upon several occasions, he declined meeting adversaries in duels, upon the ground that it was unbecoming in him to fight "down-hill;" in other words, that he did not choose to enter the lists with antagonists who were far beneath him in position; which reminds me of General Putnam's response to a pugnacious individual who sent him a challenge, viz., that "every body knew very well old Putt was no coward, and was not obliged to fight every d—d rascal that came along, either."

An incident in the eventful life of General Houston, which occurred in Tennessee before he went to the Cherokee country, affords a cogent argument in refutation of the charge of cowardice which some of his calumniators have brought against him.

At a large political gathering in Nashville, about the time he was running for governor, a Mr. J——g sent him a challenge through the hands of the noted John T. Smith.

Now this man Smith, of whose bloody career I shall have occasion to speak more fully at another time, was not looked upon with much favor in that community; and after the General had read the document he deliberately, and in presence of the whole assembly, while he looked Smith directly in the eyes, tore it into pieces and dashed it upon the ground, at the same time remarking that "he was not in the habit of receiving challenges through the hands of assassins."

The observation was heard by the crowd, and was taken up by General W——e, who, if not a friend of the challenger, did not entertain kindly feelings for Houston, and he said, in a loud tone of voice: "The gentleman seems to be particularly fastidious to-day. I wonder whether he would condescend to accept a meeting with *any* man—for instance, with myself?"

This remark, which was apparently addressed to the people, was of course intended for the ears of Houston. He heard it, and promptly replied: "You had better try me, Sir."

I shall only add that he did try him, and with his life paid the penalty of his indiscretion.

As many are not familiar with the early history of this remarkable individual, I take this occasion to observe that he was a blacksmith by trade, and received but little education during his boyhood, but his eminent natural abilities soon brought him into notice, and the happy faculty which he possessed of ingratiating himself into the favor and confidence of those with whom he came in contact soon gained him many friends, and he was at a very early age sent to Congress from his native State.

His tall, erect, and highly graceful and dignified bearing, united with great suavity of address, and agreeable social qualities, soon made him companions at Washington, and he was re-

garded as one of the most promising young politicians of that day.

It is said that certain mutual friends were very desirous about this time of bringing about a meeting with the rising young politician and a very beautiful and aristocratic belle of Baltimore, Miss R——y.

To effect this Mr. —— gave an elegant banquet, to which Houston, the young lady alluded to, and many of the élite of the city were invited, and it was arranged that at an opportune moment during entertainment Houston's name should be alluded to, and that Mr. M——l, an older member of Congress from Tennessee, should take that as a text for eulogizing his young colleague in such exalted terms as to attract the attention of the ambitious female sprig of aristocracy.

Accordingly, when the proper moment arrived, his old friend, who was from the rural districts himself and had but little sympathy with aristocracy, said: "Is it Sam Houston you are speaking of? Why, I've known the young rascal ever since he came barefooted over the mountains to work at the blacksmithing business in our county; and when I first met him he had cracks in his heels as wide as your fingers. I tell you he is a self-made man, and he's bound to make his mark."

It may readily be conjectured that this encomium, instead of elevating the youthful hero in the estimation of the haughty belle, only served to render him obnoxious to her. The acquaintance proceeded no further.

After this the General was Governor of Tennessee, and subsequently he passed a year or two among the Cherokees, and from thence he went to Texas, where he founded a Republic, and there is no question in my mind about his personal bravery. Moreover, he was an excellent judge of character, and probably no man ever lived who possessed a happier faculty for extricating himself from a critical position than he.

With these somewhat discursive preliminary digressions I proceed with my narrative.

At the period alluded to the General was in the daily habit of walking out to a farm-house near Austin, where he invariably received a cordial welcome, and never failed to get his favorite buttermilk beverage.

The proprietor of the establishment, Mr. W——d, felt proud of entertaining so distinguished a guest, especially as he regarded him as one of his stanchest friends, and he took every pains to induce him to repeat his visits.

Now it so occurred upon a certain occasion, when politics ran high and factious animosities were exceedingly acrimonious, that W——d was nominated for an important office, and being very desirous to secure the election he frequently counseled with his old friend Houston in regard to the best method of conducting the canvass.

The old veteran of San Jacinto, with all apparent sincerity, entered most cordially into the

views and interests of his friend, and cheerfully gave him the benefit of his matured political experience, and thereby inspired W——d with full confidence in the ultimate success of his election, and every thing progressed satisfactorily, until one day W——d received a letter from a friend, inclosing another written by General Houston to the opposing candidate, in which he expressed the opinion that W——d was utterly unfitted to fill the position, and that every effort should be made to defeat him.

Astounded at such barefaced duplicity he put the letter into his pocket, and anxiously awaited the General's next visit, firmly resolved to call him to account for it.

He arrived as usual, and seemed in excellent spirits, accosting Mrs. W——d with, "Good-morning, lady. I hope I find you very well to-day, and pray how are the darling little ones this morning, lady?—And, my dear old friend W——d, how does it go with you to-day? It seems to me you are not looking as cheerful as usual. I trust nothing has gone amiss."

W——d responded very coldly to this hearty greeting, and after the General was seated asked him what he would think of a man who should come to his house every day, profess to be his best friend, partake of his hospitality, and receive numberless other favors, and after all this he should discover that this man was his direst enemy?

"Do you ask me, W——d, what I would think of such a heartless wretch? Why, Sir, my candid opinion is that ingratitude is a crime of the deepest turpitude, and I have no hesitation in saying that such a man should be hung. I say he should be hung, Sir. Shooting would be too light a punishment for such an infamous traitor."

W——d then produced the letter, and asked his guest if he would do him the favor to read it. After feigning to read it over very carefully, and perceiving that it would be useless to deny

HOUSTON BOTHERED.

its authenticity, he turned up his eyes with a most puzzled and bewildered expression, saying at the same time (in soliloquy), "That handwriting certainly resembles mine, but if I wrote it, how does it happen that I can not remember any thing about it? That's what bothers me."

After a moment's reflection he went up to W——d, with the letter open in his left hand, placed it before his eyes, and significantly shaking the index finger of his right hand at the paper, he said:

"Who would suppose that I could ever have got so beastly drunk as to write such an absurd letter. You, my dear W——d, know me too well to believe for an instant that this letter expresses my real sentiment. On the contrary, if I was called upon publicly to declare my candid opinion in floral language regarding the relative merits of the two candidates, I should most unhesitatingly and most unqualifiedly exclaim, that you were decidedly '*poplar*,' but that your opponent was emphatically a '*lo-cuss*.'"

Almost every page in the early history of Texas is replete with thrilling narrations of Indian barbarities, of desperate personal encounters, and of heroic struggles of Anglo-Saxons to wrest from Mexicans and savages the land of their nativity and graves of their ancestors.

Even after the Spaniards were subdued or driven out of the country and their leader captured, the most populous districts were not exempt from frequent predatory incursions from the warlike and hostile Comanches.

Those ubiquitous freebooters of the Plains, mounted upon fleet and enduring ponies, would, without the slightest previous warning, swoop down upon a settlement with lightning velocity, and before the inhabitants could rally for defense they were away again, leaving fire, desolation, and death in their bloody tracks.

To guard against these sudden raids the people were forced to remain continually on the alert, with rifles and revolvers by their sides both day and night.

This condition of society brought before the public many bold spirits, who otherwise would probably have remained unknown, and who by their keen instincts in combating their wily foes, and by their intrepid deeds of personal valor, rendered their names immortal upon the catalogue of border heroes.

Such men as Jack Hays, Ben M'Culloch, Walker, Cook, etc., whose memories are held in the highest veneration by their surviving contemporaries, appeared at this eventful era; and they were intrusted with the command of parties that patrolled the outer line of settlements under the appellation of "Rangers."

In the execution of this hazardous duty they had many bloody encounters with the savages, and were often victorious, but occasionally they were overpowered by numbers, and either killed or forced to flee to the settlements for protection or reinforcements.

Upon a certain occasion one of these parties, which had been scouting upon the head-waters

of the Brazos and Trinity, was driven in by the advance of a powerful war-party of Comanches, and the direction from which they were approaching induced the belief among the knowing borderers that they designed striking Nacogdoches, on the Angelina River. To meet the emergency a large force of militia was hastily called out, with orders to assemble at Nacogdoches, under the command of General Rusk, the then Secretary of War.

They were speedily enrolled, and remained some considerable time *en bivouac* awaiting tidings of the Indians, but no enemy appeared; and at length the President went there himself, and believing the danger over, he at once ordered the disbandment of the troops.

Many of the men who had suffered from Indian depredations were exceedingly anxious for an opportunity to take revenge; and the disbandment was by no means a popular measure with them. Moreover, they did not hesitate to give free expression to their sentiments upon the subject, even to denouncing in the most unqualified terms the action of the Chief Magistrate.

On the day following the "mustering out," as Generals Houston and Rusk, accompanied by the Adjutant-General, M'Cloud, were promenading arm in arm through the streets of the town, which were swarming with the disbanded volunteers, many of them collected in groups discussing the propriety of the President's order, their attention was called to a stalwart young backwoodsman, dressed from head to foot in buckskin, who had evidently taken several drinks of whisky, and was loudly and vehemently expatiating to those around him, and making frequent, and not very complimentary, use of "Sam Houston's" name.

General Houston, who could not avoid hearing some of these allusions, turned to his companions and said: "It appears to me, General Rusk, that you do not preserve very good discipline in your command."

"They have been disbanded, and I have nothing further to do with them," replied the General. "Moreover," he added, "I am of the opinion that it would not be so easy a matter to stop their talking, even if they were still in service."

"Come along with me, gentlemen, and I'll show you how to quell such disgraceful exhibitions," said Houston.

The others merely observed that "they would like to witness the performance," and followed into the packed crowd, which made way for the distinguished personages, enabling them to penetrate to the side of the noisy orator, who still continued his vociferous harangue, accompanied by the most violent gesticulations and contortions of his arms and body.

Walking deliberately up to him, and laying his hand upon his shoulder, the General, in a mild but emphatic tone, said: "Are you not aware, my young friend, that you are disturbing the peace and quiet of this respectable com-

munity, and that too, Sir, in presence of the President of the Republic?"

The fellow suddenly ceased speaking at this unexpected interruption, and turning upon the huge individual who addressed him (he did not know the General, it seemed), he, in a very low but firm tone of voice, while his eyes flashed fire, asked:

"Are you Sam Houston, the President?"

"Yes, my young friend, I have the honor to bear that distinguished cognomen."

The young giant then drew back a step or two, and, concentrating all his powerful energies into the effort, sprang like an infuriated tiger upon the astonished General, knocking him down, and at the same time exclaiming, "Well, d—n you, old Houston, you are the very man I wanted to see." He was immediately pulled off by the spectators, and proceeded with his interrupted declamation as if nothing had happened, while the General retired to his lodgings, fully convinced that his friend Rusk was no disciplinarian.

At one time, while Generals Houston and Rusk were at Austin, it is said that a friend of the latter reported to him that General H. had, upon more than one occasion, denounced him in the severest terms, and his friends were unanimous in the opinion that his reputation and honor demanded that the insult should be noticed. He did not, however, pay much attention to the matter at first; but at length it became so notorious that he called on H. and required an explanation.

As soon as the object of his visit was proclaimed General Houston burst into a violent fit of laughter, and going up to R. placed his hand upon his shoulder, saying:

"It seems to me, my dear Rusk, that you are unnecessarily exercised this morning. You must be conscious of the fact that we sometimes chastise our children; and are we not permitted upon certain occasions to inflict upon our wives an affectionate pinch? Yet this does not signify that we love them any the less. I would ask you, then, if a man can't curse his best friend without his taking offense, who in the name of common-sense can he curse, I should like to know?"

The General acceded to this paradoxical simile with a questionable grace, and suggested to his friend that in future he would thank him to dispense his anathematical tokens of affection in a little more private manner than he had been in the habit of doing.

III.—COLONEL B—.

Colonel B—, when I first met him, had nearly reached the patriarchal longevity of threescore and ten. Yet he was then one of the best preserved and most genial and convivial spirits I ever encountered.

His well-proportioned, lithe, and muscular frame had been fully developed and matured by many years' active service on the distant Indian frontier, where the healthful and in-

vigorating atmosphere of the mountains and plains served to perpetuate and augment his natural buoyancy of temperament to a degree that seemed to set at defiance the sedative and enervating influences of age.

Many and many a time, after marching all day in severe storms, had he bivouacked upon the wet ground without any shelter save his poncho and blanket; and I have upon more than one occasion known him, after riding sixty or seventy miles on horseback, to dance all night at a "fandango," and appear as fresh the next morning as if nothing unusual had occurred.

He was by no means a debauchee or tippler; but at the same time he was fond of good wine, and did not object to an occasional glass of grog; and after imbibing a moderate quantity with a good dinner, he possessed an inexhaustible fund of racy anecdotes, which he could relate with better effect than any man I ever knew.

His entire military life had been passed on the border, and only at rare intervals of time had he been able to visit the Eastern cities; so that it could not of course be expected that he should be well posted in the capricious and vacillating absurdities of fashion, or the equally changeable conventionalities of dinner-table etiquette.

He was so fortunate upon one occasion as to obtain a leave of absence, and while making a short sojourn in one of the cities of New England, where the most inflexible rules of propriety were strictly enforced in all social intercourse, and where it was looked upon as rude and unbecoming at dinner-table to laugh aloud or speak above a certain modulated tone of voice, and an unpardonable breach of decorum to perpetrate a bon-mot or take more than two or three glasses of wine—while in this somewhat puritanical city he was honored with an invitation to dine with several gentlemen at the mansion of the nabob of the place.

At the appointed hour he was ushered into the magnificent dining-room, which was brilliantly illumined with numerous jets of gas evolved from gorgeous French chandeliers; and the huge mahogany table was groaning under the weight of a costly service of Sèvres china, embellished with sparkling Bohemian cut-glasses of the most exquisite design and finish; while soup, vegetable, and sundry other dishes, of massive embossed silver and gold, showed that every thing which money could contribute to give brilliancy and effect to the banquet had been unsparingly bestowed by the liberal host.

But this munificent display of luxury and wealth did not seem to be appreciated by the borderer, or to create much more impression upon him than his pine camp-table, garnished with tin plates and cups, would have done.

When the dinner was announced the Colonel seated himself *sans ceremonie* among the other guests, as perfectly self-possessed and as much without *mauvaise honte* as a professional diaer-

out would have been. It is to be remarked, however, that he would have preferred before sitting down, in accordance with his usual custom, to have taken an "appetizer" in the form of a whisky-cocktail; but as no one set him the example he reluctantly dispensed with this preliminary, and took his raw oysters on the half-shell, after which the host passed the sherry to him, and he eagerly swallowed a few drops of it from a miniature glass.

The soup and fish courses were then introduced, and disposed of with all due ceremony; but, greatly to the Colonel's disgust, the wine remained stationary, and the company, with the exception of a few subdued whispers, was as mute and grave as a Quaker meeting.

After this followed the meat course, and the most piquant *entrées*, all of which passed off strictly *en règle*; but still the bottle did not circulate.

Then came the choicest game, served in the most approved style, unaccompanied, however, with an intimation that another glass of wine would give more zest to its flavor; and the spirits of the party seemed, if possible, to wax more lugubrious and heavy than before, until at length the Colonel, having exhausted all his powers in curbing his patience, took the liberty of asking the host if he had ever heard of the ghost that once appeared to some of the army officers in New Mexico.

He replied that he had never heard of the circumstance before, and begged the Colonel to relate it. Others of the party expressed their total disbelief in such spiritual manifestations; but all united in urging the Colonel to tell the story, which he did in the following language:

"During the Mexican war, as you will doubtless remember, gentlemen, our Government sent out troops to take possession of the Territory of New Mexico. The detachment was composed of volunteers and regulars, to the latter contingent of which I had the honor to belong.

"We marched from Fort Leavenworth, on the Missouri River, and our track crossed the Plains, where there was but little to interest or divert our minds from the monotonous and toilsome duties which necessarily devolved upon us.

"Nevertheless, many of the officers were jolly, convivial spirits, whose effervescent flow of good-humor could not be dampened by the most disheartening combination of adverse influences; and they resorted to various ingenious expedients to while away their few leisure hours. Some of them stalked the buffalo or antelope, and amused themselves in innocent field-sports, while others became addicted to the more demoralizing pastime of cards; and while the sutler's supply of liquor held out this customary concomitant stimulus of gaming was freely imbibed; but long before the march terminated it was seldom that an officer could get any liquor for love or money, and when he did, it came in the form of a prescription from the medical officers, the most of whom had seen

service, and were not easily humbugged by 'old soldiers.'

"In spite of this restriction, however, they kept up their spirits wonderfully, and the gaming *coterie* especially continued to hold its nightly meetings without a drop of whisky.

"They were not, it must be acknowledged, quite as merry as when the 'flowing bowl' circulated freely, as they were all good 'trenchermen;' but the stimulus of betting served to divert their minds from disagreeable duties, and they played on night after night. One dark and dismal night, when their sitting had been prolonged into the small hours of morning, a death-like silence pervaded the entire camp, and all were becoming sleepy and wearied, when suddenly they were startled by the loud explosion of a terrific clap of thunder which burst directly over their heads, and reverberated through the sky like the salvo from a huge park of heavy ordnance, and immediately great drops of rain, driven before a violent tempest, came pattering like buck-shot against the tent. The lightning flashed vividly from every point in the heavens, the rain poured down in torrents, and all the elements seemed in an angry mood to conspire in producing the greatest possible chaos.

"The cards were instantly dropped upon the table, and the astounded votaries of gaming sat gazing upon each other in consternation and terror, until, during a brief interval in the lightning flashes, the canvas door of the tent, as if by a magic hand, was slowly and noiselessly raised, and a tall, wan, and cadaverous figure, draped from head to foot in a flowing white robe, seemed to rise out of the earth and fill the opening, and slowly raising his bloodless and corpse-like arm, he deliberately pointed his long, bony forefinger at the cards upon the table, revolving his glassy eyes within their cavernous orbits, and directing them reproachfully upon each one of the trembling gamblers in succession, while the tears coursed down the deep furrows of his pale and emaciated visage, he in a most sepulchral and lugubrious intonation of voice gave utterance to speech. Yes, gentlemen, this frightful spectre spoke."

Then, appearing to be so much paralyzed by the effect of his own narration that he could proceed no further, he wiped his eyes, and was silent. After the gloom cast over his auditors had become partially dispelled one of them ventured to inquire if it was really true that the apparition spoke.

"Certainly," replied the Colonel, "his utterance was as distinct and emphatic as mine at this moment."

Another inquisitive gentleman asked if he had preserved a distinct remembrance of the purport of the language that issued from the mouth of the phantom.

"Ah yes," answered he, with a most solemn expression of countenance, "I recollect it but too well, ay, too well gentlemen, and if I were permitted to live a thousand years I should not be able to eradicate it from my memory."

A LONG TIME BETWEEN DRINKS.

"Pray, then," said they all (their curiosity now wrought up to the highest point), "tell us what the ghost said."

Thus importuned the Colonel with the greatest apparent reluctance replied: "Very well, gentlemen, if you will insist upon my repeating the words that were uttered upon that solemn occasion you must be responsible for the consequences."

Then with the deepest intonation of his naturally heavy bass voice, he added: "The ghost said, gentlemen, the ghost said, '*It's a monstrous long time between drinks!*'"

A simultaneous burst of uproarious laughter followed the ludicrous termination of the facetious Colonel's story, and it is needless to add that the wine circulated much more freely afterward.

On the arrival of the army of occupation in New Mexico our hero was assigned to the command of the garrison at Santa Fé, in which capacity he was required to exercise both civil and military functions. This necessarily brought him in frequent contact with the native Mexicans, whose Spanish dialect he had no more knowledge of than they had of the idiom of the

Anglo-Saxon, and all official intercourse had to be conducted through the medium of interpreters.

It so happened upon one occasion, when the interpreter was absent, that a Mexican woman called to see the "*Commandante*" on business, and on entering the office she, with a very graceful obeisance, politely accosted him with the customary salutation of "*Comment esta usted, Signor?*"—(How are you to-day, Sir?) which, as near as the Colonel could make out, signified, "I've come to stay, Sir."

He was not a little astonished at the uncere- monious manner in which the Signora declared her intentions, and was very considerably em- barrassed at first; but, after a moment's reflec- tion, he concluded to let her remain until the interpreter returned. Accordingly, putting the best face he could upon it, he said: "Come to stay, have you, old lady? Very well, then, sit down, and make yourself at home."

Then he added, soliloquizing, "Devil of a fix I'm getting into now sure enough."

The woman, not having the remotest concep- tion as to the import of what the Colonel was talking about, remarked: "*No intende, Señor*" (I don't understand you, Sir).

"Very well," replied the Colonel. "If you *no intended* to stay, what in the *dévil* did you come here for?"

NO INTENDE, SEÑOR.

IV.—MONSIEUR M—.

The wonderful changes and transformations that have resulted from the settlement and de- velopment of the resources of the gigantic West

within the past four decades seem marvelous indeed.

In 1832 it required a month of toilsome trav- eling to make the journey from New York to Chicago, which then contained about two hun- dred inhabitants. Now, the same journey is accomplished with perfect ease and comfort in thirty-six hours; and Chicago has to-day a population of two hundred and seventy-five thousand souls, and is the best-built city on this continent.

Wisconsin at the date alluded to was an un- populated wilderness, and there was but one house between Chicago and Green Bay, that of Solomon Juneau, an Indian trader at Mil- waukee, and but one house on the Galena road, at Dixon's Ferry, upon Rock River.

With the exception of a few people around the lead mines in the vicinity of Mineral Point, there was not at that time a single farmer in Wisconsin.

And now the entire vast area of this beautiful State is absorbed and cultivated by industrious and thriving farmers.

One bright and lovely day in 1833 I married a young wife seventeen years of age, and im- mediately after the ceremony was performed we bade farewell to our friends in the East, and with all our worldly effects, consisting of a piano, carpet, rifle, and pair of pistols, we set out on what was considered a desperate ven- ture to seek our fortune in the remote wilds of Wisconsin.

We traveled by the fast line of canal boats to Buffalo, and from there upon a wretched old hulk of a steamer to Detroit, where we were obliged to wait ten days at Woodworth's Steamboat Hotel (and such a hotel!) for a schooner bound for Mackinaw and Green Bay.

At length we embarked on the *Austerlitz*, and were crammed into a small, filthy cabin of about eight feet by ten with twenty other fel- low-victims, which my somewhat romantic little wife did not consider exactly *comme il faut*; but as this was the best we could do we sailed, and after eighteen long days of sea-sickness, low diet, torture, and other sea-going concomi- tants—to say nothing of home-sickness and other kindred complaints—we were finally per- mitted—thanks to a merciful Providence—to place our feet once more upon land in the new territory of Wisconsin.

In accordance with the custom of the coun- try we, after selecting our place of residence, "squatted," and "made our claim" near the es- tablishment of an Indian trader named M—n, who prided himself upon his French lineage, and had at an early age enlisted in the service of the Northwest Fur Company, leaving his home in Canada for the Indian country, where he had remained ever since. He had cast aside what he conceived to be the senseless conven- tionalities of the settlements, and adopted many of the more useful habits and customs of the na- tives.

MY BRIDAL TRIP.

When I first met him he was probably over seventy years of age, yet his mental and physical powers were then as active and vigorous as those of most men in the meridian of life; and, as strange as it may appear, he had just perpetrated the hazardous experiment of espousing "*à la mode de sauvage*," his fourth wife, who was a vivacious young squaw of about sixteen, and quite an interesting and attractive specimen of her race.

The old man was very much enamored with his new bride, and seemed perfectly happy during the first few days of the *re-re-reiterated* honeymoon; but possessing a suspicious disposition and a highly nervous and impulsive temperament, he in a short time took it into his imagination that he was too old to please the fancy of so young a girl, and became furiously jealous of every young man who spoke to his wife or even came near his house.

Knowing this foible in his character, and being somewhat inclined to practical jokes, I took every opportunity to inquire anxiously after the health of *Madame*; but instead of receiving this in good part the old man invariably turned away

from me manifesting symptoms of great displeasure.

One morning when, as it appeared, the old gentleman happened to be in particularly ill-humor, I called at his house, and after extending to him the customary compliments of the day, I very blandly asked: "*Comment se porte la Madame ce matin, Monsieur?*" (How's your wife this morning, Sir?)

Instead of giving a direct answer to my courteous interrogatory his countenance assumed a ferocious expression, and he walked back and forth for some time gesticulating rapidly, and muttering to himself some unintelligible French jargon, the only part of which I comprehended was a frequent guttural roll of the emphatic French adjective "*Sac-r-r-r-é*," coupled with what I took to be the not very complimentary adjunct of "*Yankee*," most spitefully hissed out from between his teeth.

After giving vent to his indignation in this manner for a while the expression of his face suddenly changed, assuming an air of the most triumphant gratification, and walking directly to me he straightened himself up, placed his

HOW'S YOUR WIFE?

arms akimbo, and looking me in the eyes, said:

"*What for you keep ax me dat all 'e time, eh? Sac-r-r-ré battam. What for, eh? How's you wife yousef?*"

This superlatively ludicrous retort caused me to explode with an uproarious peel of laughter, which exasperated the old man to such a degree that, coming close to my side and raising his voice to the highest pitch, he screamed into my ear: "*Mistère Yankee! I like for know how's you wife yousef, eh?*" Then turning his back upon me in the most contemptuous manner, he rapidly walked away, believing, no doubt, that he had completely demolished me.

Time did not have the effect of assuaging the irritation produced upon his sensitive imagination, or of reconciling the discords in his household. On the contrary, his jealousy continued to become more and more annoying and vexatious to the young wife, until at length she was unable to endure it longer and left him for Prairie du Chien, where she found friends that protected her.

The old man took her loss very much to heart, and for days did nothing but walk solita-

rily around his house with his head cast down, and apparently buried in deep melancholy reflections. Indeed, the poor fellow seemed almost heart-broken.

I chanced to meet him about this time, and, feigning ignorance of what had occurred to him, expressed the earnest hope that Madame continued to enjoy her usual good health.

He looked up at me with an expression which indicated any thing but credulity as to the sincerity of my motives, and, with a very indignant scowl upon his face, replied: "*Ma femme? you like for find out where he gone, eh? Ce bon, by Gar, I tell you! He gone's to ze prairie de sac-r-r-ré battam dog, ce bon, let him gone!*"

M——n was of Roman Catholic parentage, and had received his early education under the strictest tenets of that creed; but he had been so long separated from all the influences of Christianity, in any form, that he had become rather indifferent to the things that pertained to his spiritual welfare, and consequently gave himself but little anxiety or thought upon the subject; yet if any one had intimated to him that the course of life he was leading was such

as to jeopardize the salvation of his soul, he would have been highly astonished and incensed.

It was seldom, in those days, that we saw a preacher of the Gospel, and the few that visited us were of the itinerant order, whose extended circuits over the sparsely populated district rendered their periodical visits, like those of a higher order of beings, "few and far between."

Father B——, a very zealous ecclesiastic of the Jesuitic order, upon one occasion came to our settlement, and during his sojourn called upon the Frenchman, who received him very kindly, and, after a short preliminary conversation, the priest approached the subject of his mission by inquiring of him if he was a religious man.

With an air of surprise at such a question, the old man answered :

"Certainement, Monsieur! religious man me, *very mouch.*"

"Pray, Monsieur M——n, will you have the kindness to inform me what denomination of Christians you class yourself with?"

He replied tartly, but with decided emphasis, and rapidly nodding his head at the same time :

"*De same as me fader.*"

"Ah yes, yes, I see. Will you permit me, then, to ask you, Monsieur, what particular persuasion of religious people your father associated with?"

"Oui, Monsieur," replied he, "*wid de same peeps as me grandfader.*"

"Very well, Monsieur. Will you also allow me to inquire what name was given to the particular faith that was adopted by your venerated ancestors, and through them transmitted to you?"

He hesitated for a moment, and seemed somewhat puzzled to find an answer to the interrogatory thus reiterated upon him in so many different forms, but he soon rallied and promptly responded, "Oui! oui!! oui!!! *Me religion he de same kind as de bibe.*"

The good "Father," in despair at getting any more definite information from him concerning the complexion of his religious sentiments, intimated to him that it was all very well provided the Bible which he took for his guidance was the version sanctioned by the Romish authorities, but cautioned him against the diabolical influences of the rendering given by the Protestants to the same book.

Some weeks subsequent to this a preacher of the Methodist persuasion came around, and during his stay among our people he took occasion to call upon the Frenchman, but failed to elicit any more satisfactory information about the old man's religion than the Jesuit had done. He however gave him good spiritual counsel, and left a Bible which he recommended him to peruse daily, and bade him a kind adieu.

He continued on his circuit, and in due course of time returned to the settlement, when he again

paid a visit to the Frenchman, hoping that the good seed which he had dropped by the way-side might have germinated during his absence; but unfortunately for the success of his efforts, the Jesuit had been there in the interim, and had taken the responsibility of throwing the obnoxious Protestant Bible into the fire.

Knowing nothing of this the preacher inquired of M——n if he had complied with his request in frequently reading the Scriptures during his absence. He answered: "I no reads him mouch now, for ze d——d priest he burns up all de bibe in de fi."

When I next encountered the old man I remarked to him that I had understood the *French* priest had been burning Bibles, and playing the devil generally at his house. He was nettled at the nationality of the allusion and replied, with considerable irritation,

"C'vrais, zat is so, Monsieur. Ze *French* priest he burn ze bibe, but all ze 'Merican peep's he make de-dev' too, by gar."

After many years' absence in the mountains about the head-waters of the Missouri and Yellowstone, the old man returned to Montreal on a visit to his friends and relatives, but on his arrival he, like Rip Van Winkle after his protracted nap, wandered about the streets, not being able to recognize a single familiar face. All his relatives were either dead or absent, and the friends of his youth had disappeared, so that he soon turned his back in disappointment and sorrow upon the place of his nativity, and resolved to go back to the Indian country and spend the remainder of his days there.

Accordingly he embarked upon a steamer at Buffalo (the *Uncle Sam*), on which it so happened that General Scott and his Staff, who were about making the tour of the Lakes, were passengers. The steamers of that period had no private state-rooms, but there were large dormitory cabins, in which all the passengers slept in berths ranged upon the sides.

On the morning following their departure the General was making his toilet in the cabin, when M——n entered, and omitted to close the door after him.

As it was quite cold at the time the General looked up at him scowlingly, and pointing to the open door, said to him in a very stern and peremptory tone of voice, "*Shut that door, Sir.*"

The old man was not accustomed to this dictatorial manner of issuing orders, and instead of obeying, replied, in an equally brusque manner, "No, General Scott; me no shet e-door. My money good as every peoples, by gar."

The General saw that he had made a mistake, and very graciously begged pardon, but asked the old man very politely if he would be so obliging as to close the door which he had left open.

He answered with a profound bow, "Certainement, General Scott. Me shet e-door for you wid very mouch plasir."

MAKING WATCHES BY MACHINERY.

SUN-DIAL IN AN ENGLISH CHURCH-YARD.

“**W**HAT o'clock is it?” asked Emanuel Swedenborg, upon his death-bed. Being told, he answered, “It is well; I thank you; may God bless you;” and the pure spirit of the venerable teacher gently passed away. “What o'clock is it?” ask little children, as they blow off the feathered seed-vessels of the dandelion, and tell the hour by the number that remain upon the stalk.

Civilized man every where, from the cradle to the grave, repeats this question oftener than any other. Were all things at rest it could never be answered. Motion alone enables us to measure time. Motion is best exemplified in the heavenly bodies, particularly the sun. Yet man, “the tool-making animal,” never asks, “What o'sun?” but simply “What o'clock?” He has brought artificial time-keepers to such perfection that they are the most wonderful of his mechanical achievements, the things most

alive and human in the entire range of his handiwork.

Primitive man had little need of clocks or watches. The opening and closing of flowers; the voices of birds, beasts, and insects; the positions of sun, moon, and stars, told the passage of time with accuracy enough for his simple life. Mariners, hunters, shepherds, and all other men much alone with nature, still keep familiar with her habits and her moods. The Indian says, “Four moons have passed,” or “It was ten sleeps ago;” and the farmer, “It was between day and sunrise,” or “It was half an hour by sun.”

Job's expression, “As a servant earnestly desireth the shadow,” points to the earliest artificial time-keeper. The sun-dial (*dialis*, daily) originated, nobody knows when, with some of the Eastern nations. Isaiah wrote, eight hundred years before Christ, “I will bring back the shadow of the degrees which is gone down in the sun-dial of Ahaz ten degrees backward.”

A dial, usually standing upon a stone post on a sunny knoll, is still preserved as a relic of the past in almost every English country churchyard. Around it on Sunday mornings, an hour or two before service, were wont to gather the

THE CLEPSYDRA.

rustics, discussing crops, the weather, and politics, while matrons gossiped soberly, and children tumbled in leap-frog over mossy tombstones, or played ball against the tower, till the parson's tinkling bell summoned all to worship.

In clear weather the dial showed the hour by day, as the stars did by night; but when clouds came something more was needed. Hence the East originated the "Clepsydra" (the "Water-Stealer"), a transparent, graduated vase filled with liquid, which slowly trickled or stole away through a little aperture in the bottom. The receding height marked the passage of the hours. The clepsydra was used in ancient China, and in Egypt under the Ptolemies. Cæsar found it among the native Britons. Pompey introduced it into Roman courts "to prevent babbling." One of Martial's epigrams counseled a dull declaimer, who was constantly quaffing from a glass of water during his endless harangue, to relieve both himself and his audience by drinking from the clepsydra instead.

In the Colony of Massachusetts Bay two centuries ago an hour-glass stood before the Puritan preacher, and was turned by a tithing-man when he began his sermon. If he stopped long before the sand ran out, his hearers were dissatisfied; if he continued long after, they grew impatient.

The hour-glass is only a modification of the clepsydra. It substitutes fine sand for water, as something which will neither freeze nor evaporate, and which, when the glass is full, will run little faster than when it is nearly empty. It was known be-

HOUR-GLASS.

fore the Christian era, and has been used by nearly all nations. It was so common among our ancestors a hundred years ago that the illustration which we copy from the New England Primer of 1777 was drawn from one of the most familiar objects in their daily life.

In dry, equable Eastern climates the clepsydra long maintained its supremacy, and it is used in India even to this day. It was exceedingly inaccurate, but improvements were constantly added. Sometimes water flowed in tears from the eyes of automata, and sometimes a floating statue rising and falling with the liquid pointed to the passing hours engraved upon an upright scale. Next, a little wheel was introduced, on which the water fell drop by drop, turning it, and thus communicating motion to hands upon a dial. In time machinery was inserted to tell not only the hours of the day, but the age of the moon, and the motions of other heavenly bodies; and finally the clepsydra grew into an ingenious and complicated water-clock." A thousand years ago a Persian caliph, the Haroun-al-Raschid of the Arabian Nights, sent one to the Emperor Charlemagne which had a striking apparatus. When the twelve hours were completed twelve doors opened in its face; and from each rode an automaton horseman, who waited till the striking was over, and then rode back again, closing the door after him.

"Clock" originally signified "bell," and the French *cloche* still retains that meaning. The invention is claimed for many different peoples and eras, from the Chinese two thousand years before Christ down to the Germans of eight centuries ago. The first general use of clocks was in monasteries, during the eleventh century. Before their appearance the sacristan sat up to watch the stars that he might waken the monks at the hours of prayer. The common people attributed their origin to the devil; and had any body outside of the religious orders incurred

OLD-FASHIONED CLOCK.

SHIP CHRONOMETER.

the odium of first introducing them, he would doubtless have been put to death as a sorcerer.

For several hundred years they were exceedingly rude and irregular. But not long after the Pilgrims landed at Plymouth, Galileo, while noticing the vibrations of a hanging lamp, discovered the great principle of the pendulum—that when a suspended body is swinging, any increase or decrease of its speed will not change the number of vibrations it makes in a given time, but only the length of the arc it describes. The pendulum was soon applied to the clock, and added greatly to its accuracy. Public clocks nevertheless have always been tempting marks for the shafts of satire. The proverb, “As untrustworthy as a town clock,” still continues in vogue; and there is a witty saying in Peterborough, England, that if the clock of the cathedral and that of the parish church ever strike simultaneously there will be a death in the minster yard.

Until after the Revolution the American colonies had few clocks of any kind. Sun-dials and hour-glasses sufficed for those leisurely days. Why is it that the more we multiply inventions for saving time and labor, the more we are pressed for minutes, and the harder we have to work?

Thirty years ago “The varnished clock that clicked behind the door” was the great domestic time-keeper. Who has forgotten its monotonous “click-clack,” or its quaint, upright case, taller than a man? What true Yankee boy ever failed, sooner or later, to take it to pieces, and see how it was made? Ah! the kitchen bellows, cut open to learn what was inside, was very disappointing; but the old family clock, surreptitiously dissected, proved its own exceeding great reward. Until within the last two or three generations all our time-keepers were made in Europe. Now, Connecticut clocks tell the hour at Jerusalem, at Calcutta, at Peking, and at Irkoutsk. At our factories a fair little clock, neatly cased, can be afforded for eighty cents gold. American inventiveness has done it!

Town clocks and chronometers are regulated from the nearest observatories. But the electrical clock will do away with that. One at some central point will serve for a city as large as New York. Wires connecting with

dials on all the church towers, and, indeed, in all the dwellings, may regulate the hands of every clock in the metropolis to perfect uniformity. When the telegraph nerves run into every house we shall all get the time of day from a common source, as we do gas and water.

The ship chronometer—for determining longitude at sea—was invented in 1675. One costs about four hundred dollars. The most are of English manufacture, though there are half a dozen makers in the United States. A few years ago the Greenwich Observatory paid a premium of three hundred pounds for a chronometer which had varied only about one second in twelve months. It makes no difference whether one is fast or slow; all the shipmaster requires is that it shall run with regularity. No other invention since the mariner’s compass has so diminished the perils and uncertainties of navigation.

“Watch” is from a Saxon word signifying “to wake.” At first the watch was as large as a saucer; it had weights, and was called “the pocket clock.” The earliest known use of the modern name occurs in a record of 1542, which mentions that Edward VI. had “onne larum or watch of iron, the case being likewise of iron-gilt, with two plumettes of lead.” The first great improvement, the substitution of the spring for weights, was made about 1550. The earliest springs were not coiled, but only straight pieces of steel. Early watches had only one hand, and required winding twice a day. The dials were of silver or brass; the cases had no crystals, but opened at back and front, and were four or five inches in diameter. A plain watch cost the equivalent of \$1500 in our currency, and after one was ordered it took a year to make it.

There is a watch in a Swiss museum only three-sixteenths of an inch in diameter, inserted in the top of a pencil-case. Its little dial indicates not only hours, minutes, and seconds, but also days of the month. It is a relic of the old times, when watches were inserted in saddles, snuffboxes, shirt-studs, breast-pins, bracelets, and finger-rings. Many were fantastic—oval, octangular, cruciform, or in the shape of pears, melons, tulips, or coffins.

SKULL WATCH OF MARY STUART.

OLD VERGE WATCH.

Mary Queen of Scots had a large one in the form of a skull, which is still preserved by a gentleman near Edinburgh. The case is opened by dropping the under jaw, which turns upon a hinge, while the works occupy the place of the brain.

Old watches are common in English museums. There are comparatively few in the United States; and I know of none of American manufacture much over fifty years old. F. W. Chamberlain, of No. 233 Hanover Street, Boston, has upward of two hundred—much the largest and rarest collection on our continent. One of the most curious is an old English verge, two inches thick. If it were only half as large it would be a perfect specimen of the ancient bull's-eye.

Another of Chamberlain's treasures—also an English verge—is over two centuries old. One would like to see a photograph of the man it was made for, knee-breeches, horse-hair wig,

AUTOMATIC FRENCH WATCH.

and all. It keeps excellent time, not varying two minutes a week, though its little heart has throbbed on while six generations of owners have wound it, and carried it, and left it at the jeweler's for cleaning—have been born by it, and lived by it, and died by it.

A third is a French striking watch two hundred years old, with elaborate ornamentation, and allegorical male and female figures on the dial. When the works within strike the hours these figures pound with hammers upon little counterfeit gold bells, as if they produced the sound.

The ticking of a watch—the beating of its heart—is the playing of the two arms of the pallet in between the teeth of the scape-wheel, at the point where the rotary motion of the wheels or "train" changes to the vibratory motion of the balance. In nine cases out of ten a skilled watch-maker can tell whether there is any thing wrong with a watch, and if so, what, by putting it to his ear, as a skilled physician learns the condition of the human time-keeper by feeling its pulse or hearing its heart.

OLD BARREL AND FUSEE.

The mainspring is the locomotive, the wheels are the train, and the balance and hair-spring the brakes. When the mainspring is first wound up its force is much greater than when it is nearly run down. The old barrel and fusee watch equalized this by making the fusee spiral. When the mainspring was fully coiled, and pulled hardest, it acted upon the small end of the fusee, where the most power was needed. As the spring grew weaker the chain descended to where the fusee was larger, and required less force to turn it.

The English yet retain the spiral fusee, on their national theory that whatever is old ought to continue. The American watch dispenses with the fusee altogether, perhaps on our national theory that whatever is old ought to be abolished. Its mainspring instead communicates motion directly to the train, and its nice adjustment of hair-spring and balance-wheel insures equal time through the twenty-four hours. When a watch is first wound up the

THE TOWN OF ELGIN.

balance may make one revolution and a half at each impulse from the scape-wheel, and when it is nearly run down, only half a revolution; but the former will consume no more time than the latter, and so the watch goes uniformly through the twenty-four hours.

How shall it be made to go uniformly through summer and winter? A steel rod may be fitted into a hollow steel cylinder so perfectly that it will not drop out of its own weight, and yet it can be turned or pulled out by the thumb and finger, and it moves with the softness of velvet rolling on velvet. Hold the same rod in the shut hand for five minutes and the warmth of the flesh will expand it so that one can not drive it in with a sledge-hammer. Then put it in a refrigerator and it will contract till it rattles in the cylinder. If the metal is brass, temperature affects it still more. Winter will so contract the balance-wheel of a watch that it may gain two minutes in a day; or it may be thrown out of time by a few hours' sleigh-riding, or by hanging all night against a cold wall. Uneven temperature is the deadly foe of uniform time-keeping.

In 1767 John Harrison was awarded a premium of £20,000, under an offer of the British Parliament—which had been standing fifty-three years—for any invention which should so far overcome this difficulty as to enable shipmasters at sea to determine longitude within thirty miles of accuracy. He gained it by applying to ship chronometers the principle of the compensation-balance, now used in all fine watches. It is simply a balance-wheel with outer rim or tire of brass, and inner rim and cross arm of steel. The cold, which would contract steel alone and make the circumference of the wheel less, equalizes that by contracting the brass still more, the brass being so confined that *its* contraction enlarges the wheel.

Under the influence of heat the steel's expansion would enlarge the wheel, but then the greater expansion of the brass contracts it. When these two influences are so nicely adjusted that the one exactly counterbalances the other, the watch will keep equal time whether in Alaska or Havana.

Until very lately American jewelers imported wheels, balances, and other material ready-made from Switzerland, fitted the various parts together by hand, put their stamp upon them, and called that watchmaking. Its art and mystery was acquired in an apprenticeship of from three to five years. In Switzerland, division of labor had been introduced long before. Each workman performed some one process of shaping, cutting, or finishing parts of the watch in his own little shop at home, and returned the parts to the manufacturer, as bootmaking is done in New England. And for many processes, little labor-saving machines, run by foot-lathes, had come to be used.

In 1852, A. L. Denison, a Boston watchmaker, conceived the plan of producing watches by collecting all these machines under one roof, and running them by one power. His wild dream was that a time might come when a manufactory could turn out ten watches a day. Most of his friends voted him crazy, but he had the one quality which makes all lunacy contagious—profound earnestness. He soon made Edward Howard, David P. Davis, and Samuel Curtis as mad as himself, and the four lunatics built a factory in Roxbury.

But the Swiss authorities would not permit the export of machines, models, or drawings; so, Yankee-like, the four pioneers invented and constructed machines for themselves. Finally, they turned out a watch, the first ever made by machinery in the world. It is yet in Mr. Howard's possession, and keeps excellent time. The

THE ELGIN WATCH FACTORY.

machines were very imperfect, and much of the work was still done by hand. But from that beginning have sprung all our watch factories, now situated respectively in Elgin, Illinois, Newark and Marion, New Jersey, and Waltham, Roxbury, and Springfield, Massachusetts.

As we step aboard the Galena train at Chicago we observe the placard, "Pacific Express; does not Stop at Way Stations." We ponder behind the locomotive for forty miles; then the brakeman ends our reverie by shouting "Elgin."

Leaving the train, we gaze down upon a far-spreading little city, with court-house, academy, and churches upon commanding knolls, brick blocks and broad streets, cottages pleasantly shaded with oak, maple, and poplar, a woolen mill, a flouring mill, a butt-and-screw manufactory, and a milk-condensing establishment that ships its product to New York—all beside the bright river which cuts the town in twain, and is spanned by a gossamer iron bridge; and over the house-tops, a mile away, the tall chimney of the National Watch Factory.

In the spring of 1864 half a dozen active business men of Chicago, heard a fascinating description of the leading Massachusetts watch factory. To their willing ears it was a story with a moral, and this was the moral: "If Boston can make watches by machinery and largely supply the Northwest, Chicago can make watches by machinery and largely supply New England." It was the genuine, audacious, self-reliant Western spirit. Practi-

cal workmen assured them that with the investment of a hundred thousand dollars in buildings and machinery they could begin to turn out watches. They added fifty per cent. to this estimate for a margin, and with that blessed unconsciousness of the difficulties before them, without which no great enterprise would ever be undertaken, they organized the National Watch Company, and in November the work began.

After two years and a half spent in constructing the hundreds of intricate machines and erecting the buildings, in May, 1867, the first watch was completed. Not, however, until long after the first hundred and fifty thousand dollars was exhausted—that barely sufficed for a beginning. Before the enterprise was self-sustaining more than five hundred thousand dollars had been expended, and its owners and friends would

A WATCH FACTORY TWENTY YEARS AGO.

THE ELGIN MACHINE SHOP.

doubtless have doubled that sum rather than permit it to fail.

The watch factory of twenty years ago—let pencil and graver fix its humble features ere the place which once knew it shall know it no more forever. The tiny building, with its sign, "John Smith, Watchmaker," the single room, eight by ten, with its counter, show-case, and window hung with watches, and its one workman, who repaired fifty watches a year, and "made" two or three at odd times. Here and there one of these establishments yet exists, but it is as really a relic of antiquity as a hand-loom or a wooden plow.

The National Watch Factory at Elgin is a specimen of the great museums of machinery and bee-hives of workmen which have pushed it from its stool. The front, shown in our illustration, is two hundred and forty feet long. Several other wings are hidden in the rear. The cars of the Fox River Railway deliver material at the very door.

My first view of the factory yard was toward the close of the noon hour, when the employés were pouring back from dinner. It was a fair picture. On one side the gleaming river, with white and spotted cattle grazing upon its bank; on the other a grove of young oaks, their leaves falling from autumnal frosts; in the fore-ground scores of ruddy-cheeked girls sauntering back toward their work, while quiet artisans smoked their cigars and meerschaums upon the factory steps and a little platform where a band of operatives discourses music on Saturday afternoons in summer. A dozen young men were jumping, with dumb-bells in their hands, each trial calling out shouts of applause or merriment; and a score

of boys playing base-ball as if their salvation depended upon it. Suddenly the great bell behind the factory struck for one o'clock, and the swarm of life poured into the building.

The employés are equally divided between the sexes. I never saw so many boys and girls in an Eastern manufactory. The working day is ten hours. Whenever the welcome bell proclaims the hour of noon, or six in the afternoon, these young people give a whoop like released school-children, and can hardly wait to put away tools and make benches tidy before they join the merry throng streaming homeward.

The average earnings of the girls are something over six dollars per week—in a few cases as high as twelve; those of the boys and men three dollars per day. Board for girls costs about three dollars per week; for men, from five dollars upward. "That little girl," said the superintendent of the Steel Room to me, "can do any thing in this large department as well as any man in it;" and a number of similar cases were pointed out to me.

The Machine Shop—a hundred feet long, with thirty brawny, bare-armed workmen—is the letter A in the alphabet of the watch factory. Here all the tools and machines are manufactured and repaired. Their name is legion; their sizes are innumerable. They include machines which will take a shaving off a hair, and those which will slice up steel like apples; registers that will measure the twenty-five-hundredth of an inch, and registers that will measure a foot; drills for making holes invisible to the naked eye, and drills almost as large as crow-bars; and so on *ad infinitum*. I will not attempt to describe the "cams," "taps,"

PUNCHING THE WHEELS.

pair of steel rollers, which, if required, will leave them only one-four-thousandth of an inch thick. One of these ribbons is then passed slowly between the punch and die of a huge press, driven by a heavy wheel which a workman controls with his foot. The punch rises and falls with the motion of the wheel, coming down each time with a weight of twenty tons, and with a "click," cutting out a perfect spoked wheel. The press is an enormous monster which bites out mouthfuls of steel but refuses to digest them. Like most monsters, however, it will do no damage if it is only fed. It leaves the wheels fast in the strip to be knocked out by hand. With it a man can cut out ten thousand wheels in a single day.

1. Before the Wheels are punched.—2. After the Wheels are punched.—3. After the Wheels are knocked out.

THE STRIP OF STEEL.

"clamps," "quills," "reamers," "eccentrics," "chucks," and "wigwags." The one thing which strikes a novice is the wonderful accuracy and minuteness, the beautiful smoothness and polish of every thing. The finest jobs of ordinary machine-shops would be thrown aside here as utterly worthless.

The works of a watch, not counting the plates which form the shell or frame, are of brass and steel in nearly equal proportions. And, by-the-way, why is "brassy" a term of denunciation, and "as true as steel" the language of compliment, when brass may be made nearly as hard as steel, and will take almost as fine a temper? Steel is used in a watch wherever there is great strain upon some very slender part. But where there is much friction between two wheels one must be of brass and the other of steel. By some mysterious law of metals these will outlast two wheels of the hardest and most highly-polished steel twice over.

Great sheets of brass and steel are first received in the Punching Room, where an enormous pair of shears cuts them into ribbons. These are lengthened and thinned between a

Next we visit the Plate Room. The upper and lower brass plates are respectively the roof and floor of the watch. The upper one must have thirty-one holes bored in it, for pillars, pivots, and screws. A little girl cuts them with a needle-like drill, which revolves like lightning, and goes through the thick plate in a twinkling. Another girl, with a chisel whirling with equal rapidity, cuts away the ragged burs or edges left on the side where the drill comes out. This "countersinking," which leaves a cup-like depression, is performed wherever a hole is drilled through brass, steel, or jewel.

The four pillars—the posts which are to bind roof and floor together—are made and inserted in the lower plate by a miraculous little contrivance, which a coffee saucer would cover. The punching machine is a behemoth, but this is a fairy. It seizes one end of a brass wire,

READY FOR THE WORKS.

THE TRAIN ROOM.

and in eleven seconds measures off a pillar, turns it down to the required size, makes a screw-thread in each end, cuts it off, and screws one end into the lower plate so firmly that we can not unscrew it with a pair of pincers. But it keeps the workman's feet busy, and his hands flying as if he played a lively tune upon the piano. He will easily make and insert two thousand pillars in a day. By hand he could hardly make two dozen.

When the brass pieces are finished, all belonging to one watch are stamped with the same number and put into one of ten little boxes hollowed out in a board like birds'-nests. The nests have yet many journeys to make before the eggs are hatched; but the shell or frame is now ready for the works.

The upper plate is next engraved. Three men and four girls are kept busy tracing the elaborate scroll-work, and the inscription, "B. W. Raymond, Elgin, Illinois, No. 41,280," or "J. T. Ryerson, No. 41,290," as the case may be. The different grades made here are "Lady Elgin," "B. W. Raymond," "Mat Lafin," "G. M. Wheeler," "H. Z. Culver," "H. H. Taylor," and "J. T. Ryerson;" but the numbering runs consecutively through all.

SCREWS.

The screws in a watch number forty-four, or more than one-quarter of all its pieces. The Screw and Steel Department is one of the largest in the factory. Its magical little automata,

run by nimble-fingered girls, convert shining steel wire into infinitesimal screws, pare down their heads, and cut slots in them for microscopic screw-drivers. They are polished to perfect smoothness, and then, like every other part of the watch, brought to "spring temper"—the temper of the sword-blade—by heating, which leaves them of a rich, deep blue. The illustration shows the screws of their actual size, and also one magnified 100 times each way, or 10,000 times the actual size.

Here are machines which will cut screws with five hundred threads to the inch; the finest used in the watch have two hundred and fifty. Even these threads are invisible to the naked eye, and it takes one hundred and forty-four thousand of the screws to weigh a pound. A pound of them is worth six pounds of pure gold. Lay one upon a piece of white paper, and it looks like the tiniest steel-filing. Only by placing it under a strong magnifier can we detect its threads and see that it is shining as a mirror, and as true and perfect as the driving-wheel of a locomotive.

Screws for the best compensation-balance are of gold. A ten-dollar piece will furnish material for six hundred and fifty of them. The

THE COMPENSATION BALANCE—IN THE ROUGH, AND FINISHED.

CUTTING WHEEL TEETH.

compensation-balance comes from the Punching Room a solid piece of steel as large and heavy as a new penny, and inclosed in a rim of brass. It is ground down, worked out, and polished till it becomes a slender wheel—the outer rim brass, the inner rim and cross-bar steel—lighter and thinner than a finger-ring. Through the double rim twenty-two holes are drilled for the screws. A chuck whirls the wheel around—as one would spin a penny upon the table—four thousand eight hundred times a minute, while a lad makes each hole by applying three tiny drills one after the other. He will bore one hundred wheels per day, or apply a drill oftener than once in six seconds from morning till night—to say nothing of the time consumed in fastening on and taking off the wheels and sharpening his drills. Screws of gold or brass are then put in, and the balance is completed. On this little part alone nearly eighty operations have been performed.

Next we step into the Train Room, the largest and pleasantest in the factory. Seventy-five persons with busy fingers sit at six rows of benches extending its entire length, each before some little machine, shaping, smoothing, pointing, grinding wheels, pinions, or pivots.

Cutting teeth in the wheels is done by piling up twenty or more, with an upright shaft pass-

ing through the centre of each, and turning a screw to hold them together. The girl in charge then lifts one handle of a little machine, and instantly a steel cutter like a shingle-nail, but with a sharp point at one end, is brought against them, whirling so fast that it looks like a perfect wheel. Whizzing down the outer edge of the pile, it cuts a groove or furrow in each wheel. When it reaches the bottom she moves the other handle; the cutter flies up to the top, and runs whizzing down again. A single wheel has from sixty to eighty teeth, but the girl will finish twelve hundred wheels a day. The long, hooked teeth of the scape-wheel, and the horn shaped tooth of the ratchet, are cut with equal facility.

In the Escapement and Jeweling departments we first encounter precious stones, in which pivots of brass or steel will run for generations without any perceptible wearing. In the order of hardness they stand, diamond, sapphire, white or milky ruby, red ruby, garnet, aqua marine. In jewelry they are valued only for their color, in watch-making only for their hardness. Montana begins to supply garnets, but most precious stones come from India, Persia, or Brazil. They are always bought by the carat—the one-hundred-and-twentieth part of an ounce Troy—no matter how large the quantity. They are used not only for jeweling, but also for

tools to cut other precious stones or hard metals with. Sapphire is the favorite, because it can be sharpened upon diamond, while a chisel of diamond—the hardest of all known substances—must either be broken to give it a fresh edge, or sharpened slowly and laboriously against another diamond.

The Dutch are the most famous lapidists in the world. They sent workmen from Amsterdam to London to cut the great Koh-i-noor. They will divide a diamond weighing but one carat into two hundred and fifty little slabs, which look like fairy finger-nails. Inserted in brass handles they become ridiculous little chisels, which might turn out wheels and axles for Queen Mab's chariot. Diamond dust also, as white as snow, and finer than flour, has a hundred uses in the factory. An ounce costs five hundred dollars. Metal edges for cutting and surfaces for polishing are "charged" with it; that is, a little of the powder is firmly imbedded in them, and gives them a sharpness which nothing can resist.

Some rare watches are jeweled with diamonds and sapphires, and many with rubies; but for all practical purposes garnets and aqua marines answer as well. The "Lady Elgin," an exquisite little time-keeper, has fifteen jewels, all of ruby. Four of the fifteen in the "B. W. Raymond" are of ruby, the rest of aqua marine and garnet. The precious stones are cut into planks, and then into joists, by circular saws, and afterward broken into cubes. Then each is turned out in a lathe, exactly as a bed-post is turned in a furniture factory. By this time it weighs less than one-eighty-thousandth of a pound Troy. It is afterward burnished into its setting—a little circular rim of brass. The hole is made through it with a diamond drill, barely visible to the naked eye, and polished with another wire which passes through it and whirls one way while the jewel whirls the other. The two make twenty-eight thousand revolutions a minute. Finally jewel and setting are inserted in a little depression of the watch-plate, which they exactly fill, and held in place by tiny screws of steel, whose deep blue contrasts pleasantly with the bright gilding of the plate.

Every part of a watch must be absolutely accurate, but no part must fit perfectly. To run freely each pivot must have a little play, like a horse in harness; otherwise the least bit of dirt or expansion of metal would stop the delicate machinery. So every jewel-hole is left a little larger than the pivot which is to revolve in it for the "side-shake," and every shaft or axle a little short for the "end shake." The tiny gauges which measure all the parts make allowance for this—a bit of calculation which they perform with an ease and accuracy unknown to poor human brains.

There is another danger to guard against. If the least grain of diamond dust is left in a jewel-hole it will imbed itself firmly in the steel pivot, and then act as a chisel, cutting away the jewel every time the pivot revolves. The

BAKING THE DIALS.

new dust of ruby or garnet which this produces will act in the same way—"diamond cut diamond"—until the jewel is utterly ruined; so the utmost care is necessary to see that no particle of diamond dust remains in the watch.

After the jewelery is done the birds'-nest boxes go to the Finishing Room. In following, let us stop to glance at the Dial Department.

The dial, a plain circular plate of Lake Superior copper, no thicker than a silver three-cent piece, is first covered with a paste of fine white enamel, carefully spread on with a knife, to the thickness of three-one-hundredths of an inch. After it dries a little, a workman with a long pair of tongs places the dial flat upon a red-hot iron plate in the mouth of a glowing furnace, watching it closely and frequently turning it. The copper would melt but for the protecting enamel, and, at the end of a minute, when he takes it out it is as soft and plastic as molasses candy. The baking has "set" the enamel, but has left it rough, as if the dial face were marked with small-pox. After cooling it is ground smooth upon sandstone and emery, and then baked again.

Now it is ready for the painters. A girl draws six lines across its surface with a lead-pencil guided by a ruler, making each point for the hours. Another with a pencil of black enamel traces coarsely the Roman letters from I to XII. A third finishes them at the ends to make them symmetrical. A fourth puts in the minute marks. Then the dial goes to an artist, who, holding it under a magnifier, paints the words "NATIONAL WATCH CO." in black enamel with a fine camel's-hair brush. The inscription measures three-fourths of an inch from left to right, and less than *one-ninetieth* of an inch up and down; but even then it is perfectly legible; and the swift, cunning fingers will paint it twice in five minutes.

"Is it not very trying to your eyes?"

SETTING UP THE WATCH.

"If I were to do it all day, or even for an hour steadily," the painter replies, "they would ache terribly. But I put the inscription on two dozen dials, and then rest my sight by painting on the figures, lines, and dots."

"My father," observes the superintendent of the room, who is looking over his shoulder, "was an English dial painter. Once he traced the Lord's Prayer with one of these camel's-hair brushes on a surface one-eighth of an inch long by one-ninth of an inch wide. Half the wing of a common house-fly would cover it. It aged the old gentleman's eyes twenty years for his work, but he could see objects at a distance just as well as ever." One can only wonder that it did not strike him blind.

In the Finishing Room we find a drawer full of mainsprings, coiled so loosely that each is as large as a breakfast saucer. One drawn out straight will be two feet long. It is polished like a mirror, and tempered to a beautiful deep blue. A girl coils one to the diameter of a thimble, and then, rifling one of the birds'-nests, inserts the mainspring in its brass "barrel," the head of which is held in by a groove like the head of a flour-barrel. This circular chamber, only seven-tenths of an inch across, contains the whole power of the watch. One end of the mainspring is fast to the shaft which passes through it, and by which it is turned; the other, as it uncoils, carries around the barrel, and so communicates motion to the train. She puts the parts together temporarily, inserting only screws enough to keep them in place. Her flying fingers set up ninety watch-

es and empty ninety birds'-nests every day. The latter go back to the Plate Room for more eggs and fresh incubations; here at least there are always birds in last year's nests.

Hair-springs are made in the factory, of finest English steel, which comes upon spools like thread. To the naked eye it is as round as a hair, but under the microscope it becomes a flat steel ribbon. We insert this ribbon between the jaws of a fine gauge, and the dial-hand shows its diameter to be two twenty-five-hundredths of an inch. A hair plucked from a man's head measures three twenty-five-hundredths—one from the head of a little girl at a neighboring bench two twenty-five-hundredths. Actually, however, the finest hair is twice as thick as the steel ribbon, for the hair compresses one-half between the metallic jaws of the gauge.

A hair-spring weighs only one-fifteen-thousandth of a pound Troy. In a straight line it is a foot long. With a pair of tweezers we draw one out in spiral form until it is six inches long; but it springs back into place, not bent a particle from its true coiling. It must be exquisitely tempered, for it is to spring back and forth eighteen thousand times an hour, perhaps for several generations. A pound of steel in the bar may cost one dollar; in hair-springs it is worth four thousand dollars.

After the watch has been run a few hours, to adjust the length of the hair-spring, it is "taken down," and all the brass pieces sent to the Gilding Room. There each part is polished for electro-gilding. Gold coin is first rolled out

READY FOR THE CASE.

into sheets, and then dissolved with acids. At some stages it looks like nauseating medicine, but when it goes into the battery the solution is as colorless as spring-water. But it is a deadly poison. A girl in this room was kept at home for three weeks with sores upon her hand caused by dipping it in the liquid.

Twenty or thirty of the brass plates and wheels are hung by a copper wire in the inner vessel or porous cell of a galvanic battery, filled with this solution, and the silent electric current deposits the gold evenly upon their surfaces. Ordinarily they are left in it about six minutes: the quick, educated eye of the superintendent determines how long. A twenty-dollar gold piece will furnish him with heavy gilding for six hundred watches, but he could make it gild four thousand so that they would look equally well on first coming out; or he could put five hundred dollars upon a single one—leaving the gold an inch thick all over the works—and it would look no better. All the pieces come out clothed in yellow, shining gold, and are sent back to the Finishing Room, put together again, and then turned over to the “watchmakers”—the only persons in the factory necessarily familiar with all parts of the watch. A dozen sit in a row, in a very strong light, before a long bench strewn with their minute brushes, tweezers, magnifiers, and glass cases which cover small mountains of wheels and pinions. They insert the balance and hair-spring, see that every thing has been properly fitted, and put on the dial.

Then the watches, each in a little circular tin case, go in boxes of ten to the lynx-eyed Inspector, who scrutinizes every part for the slightest flaw or defect. Here is a box which has passed through his hands. Upon two watches are little slips of paper, one labeled “Fork strikes potance”—a slight but needless friction; the other, “Fix the number”—the figures upon some one piece being wrong or illegible. About one-third are thus sent back to the “watchmakers,” after his rigid examination.

The last scene of all is the adjusting. In his quiet little room the Adjuster keeps the Equator and the North Pole always on hand

and ready for use in large or small quantities. First he runs the watch eight hours in a little box heated by a spirit-lamp to one hundred and ten degrees Fahrenheit. Then he runs it eight hours in a refrigerator, where the temperature is nearly at zero. It must keep time exactly alike under these two conditions. If he finds any variation he changes the position of the screws in the compensation-balance, or substitutes new ones, first carefully weighing them in a pair of tiny scales of his own contriving. When we ask him to show us the minutest weight they will indicate he places a bit of whisker upon one end, and adjusts the weight. The speck of hair weighs a trifle over the fifty-seven-millionth of a pound Troy.

The watch is next carefully adjusted to keep equal time in different positions. Then it is ready for the case. Its different parts are composed of one hundred and fifty-six pieces. The old watch, made by hand, contained eight hundred pieces, if we count each link of its chain as a separate part. Reducing the number four-fifths has correspondingly reduced its intricacy, friction, and difficulties of repairing.

The proprietors realized from the outset that they could only succeed by making good time-keepers. To that one result all their energy has been directed. Manufacturing upon this large scale involves the use of so much capital that after a fine watch is finished and running they can not keep it a year for adjusting and regulating, as jewelers used to do under the old method. Most of their watches have gone out warm from the factory, but they have run with wonderful accuracy. The very first half dozen used upon the Pennsylvania Railway were brought in by the engineers at the end of six days, and the greatest variation among them was eight seconds.

The railroad is the great critic. Nowhere else is a watch so severely tested; nowhere else is accuracy so absolutely essential. After careful trial, solely upon their own merits, the Elgin watches have been adopted as the standard upon several of our leading trunk lines. On the Pennsylvania Road alone more than a hundred locomotives are run by them, and they are in use among conductors and engineers upon every railway in the Northwest, and upon the great trans-continental line from Omaha to San Francisco. That is as it should be—the Pacific Railway trains run by American watches.

Several months ago a Swiss imitation, labeled “Chicago Watch Company,” began to appear in our markets. It looks well to unskilled eyes, but is so rough and cheap that the “movement” can be sold for five dollars after paying the import duty. And lately another imitation, bearing the same inscription, but manufactured in an Eastern factory, has made its appearance. Buyers who would be sure of avoiding these spurious watches should purchase only of some reputable and established jeweler, and never of unknown, irresponsible parties, however honeyed and seductive their advertisements. But this

counterfeiting, both foreign and domestic, of an American product less than two years old, at least shows that the genuine article has won enviable reputation.

Two facts in the consumption of the Elgin watches are the shadows of coming events. First, fully half, thus far, have been sold in the East, and a large proportion of them in New England. Second, the Company are filling orders for India, which have come from London, without solicitation or advertising abroad. The prairies are beginning to manufacture for the Orient! What will this grow to in the near future, when three Pacific railways bring India, China, and Japan to our doors?

The Company make "movements" alone, dealing with the public only through local jewelers, whom they leave to case each watch according to the customer's taste or fancy. Making cases—a business quite distinct from making watches—is done on a large scale by two or three houses in the United States, and on a small scale by a great many. Crystals cost the jeweler from two and a half to seventy-five cents apiece. The finest are made in Europe; cheaper ones in New York and Pittsburg. Gold cases cost from fifty to one hundred and fifty dollars each; silver ones from six to thirty dollars; German silver about three dollars and fifty cents.

Thus we have followed the watch through its various stages until it is ready for the pocket. An expert jeweler working by hand might perhaps make a watch in three weeks. The Elgin factory, with less than four hundred and forty employes, turns out one hundred and twenty-five a day, or one every three days and a half for every worker in the establishment, including

all the young boys and girls, the book-keepers and clerks. As eighteen is to three and a half so is machinery to hand-work. In watchmaking alone, within the last fifteen years, American inventiveness has increased the efficiency of human labor more than fivefold.

Increase in product always brings a still larger increase in demand. When Denison conceived the daring project of manufacturing three thousand watches a year, his sober friends fancied that he could never find purchasers. Since then our imports have increased enormously. In 1868 we bought two hundred and fifty thousand watches, costing four millions of dollars, from Switzerland alone. About one-fifth were gold; the rest silver. An enormous proportion were of the grades which sell without cases for from five to ten dollars each, and which as time-keepers are worth about the value of the powder it would take to blow them up. In addition to this foreign supply, one hundred thousand watches a year are now manufactured in the United States. Still the demand is so great that the Elgin factory is often two or three months behind its orders for the most popular grades. The same is doubtless true in other establishments. It will continue true in the time not far distant when a good watch in a silver case can be purchased any where for ten dollars, and when American factories are turning out a thousand watches a day, for the United States and Europe, and swarming Asia.

But no degree of familiarity can ever take the charm and interest from a great watch factory. It will always be a magician's palace, which makes the story of Aladdin prosaic and commonplace.

READY FOR THE POCKET.

THE BIRDS OF PARADISE.*

NATIVES OF ARU SHOOTING THE GREAT BIRD OF PARADISE.

AS many of my journeys were made with the express object of obtaining specimens of the Birds of Paradise, and learning something of their habits and distribution; and being (as far as I am aware) the only Englishman who has seen these wonderful birds in their native forests, and obtained specimens of many of them, I propose to give here, in a connected

form, the result of my observations and inquiries.

When the earliest European voyagers reached the Moluccas in search of cloves and nutmegs, which were then rare and precious spices, they were presented with the dried skins of birds so strange and beautiful as to excite the admiration even of those wealth-seeking rovers. The Malay traders gave them the name of "Manuk dewata," or God's Birds; and the Portuguese, finding that the skins had no feet or wings, and not being able to learn any thing

* A chapter from *The Malay Archipelago: the Land of the Orang-Utan, and the Bird of Paradise*. By ALFRED RUSSEL WALLACE. With Maps and numerous Illustrations. Published by Harper and Brothers.

authentic about them, called the birds "Passaros de Sol," or Birds of the Sun; while the learned Dutchmen, who wrote in Latin, called them "Avis paradiseus," or Paradise Bird. John van Linschoten gives these names in 1598, and tells us that no one has seen these birds alive, for they live in the air, always turning toward the sun, and never lighting on the earth till they die; for they have neither feet nor wings, as, he adds, may be seen by the birds carried to India, and sometimes to Holland, but being very costly they were then rarely seen in Europe.

More than a hundred years later Mr. William Funnell, who accompanied Dampier, and wrote an account of the voyage, saw specimens at Amboyna, and was told that they came to Banda to eat nutmegs, which intoxicated them and made them fall down senseless, when they were killed by ants. Down to 1760, when Linnæus named the largest species, *Paradisea apoda* (the Footless Paradise Bird), no perfect specimen had been seen in Europe, and absolutely nothing was known about them. And even now, a hundred years later, most books state that they migrate annually to Ternate, Banda, and Amboyna; whereas the fact is, that they are as completely unknown in those islands in a wild state as they are in England. Linnæus was also acquainted with a small species, which he named *Paradisea regia* (the King Bird of Paradise), and since then nine or ten others have been named, all of which were first described from skins preserved by the savages of New Guinea, and generally more or less imperfect. These are now all known in the Malay Archipelago as "Burong mati," or Dead Birds, indicating that the Malay traders never saw them alive.

The *Paradiseidæ* are a group of moderate-sized birds, allied in their structure and habits to crows, starlings, and to the Australian honey-suckers; but they are characterized by extraordinary developments of plumage, which are unequaled in any other family of birds. In several species large tufts of delicate bright-colored feathers spring from each side of the body beneath the wings, forming trains, or fans, or shields; and the middle feathers of the tail are often elongated into wires, twisted into fantastic shapes, or adorned with the most brilliant metallic tints. In another set of species these accessory plumes spring from the head, the back, or the shoulders; while the intensity of color and of metallic lustre displayed by their plumage is not to be equaled by any other birds, except, perhaps, the humming-birds, and is not surpassed even by these. They have been usually classified under two distinct families, *Paradiseidæ* and *Epimachidæ*, the latter characterized by long and slender beaks, and supposed to be allied to the hoopoes; but the two groups are so closely allied in every essential point of structure and habits, that I shall consider them as forming subdivisions of one family. I will now give a short description of each of the

known species, and then add some general remarks on their natural history.

The GREAT BIRD OF PARADISE (*Paradisea apoda* of Linnæus) is the largest species known, being generally seventeen or eighteen inches from the beak to the tip of the tail. The body, wings, and tail are of a rich coffee-brown, which deepens on the breast to a blackish-violet or purple-brown. The whole top of the head and neck is of an exceedingly delicate straw-yellow, the feathers being short and close set, so as to resemble plush or velvet; the lower part of the throat up to the eye is clothed with scaly feathers of an emerald-green color, and with a rich metallic gloss, and velvety plumes of a still deeper green extend in a band across the forehead and chin as far as the eye, which is bright yellow. The beak is pale lead-blue; and the feet, which are rather large and very strong and well formed, are of a pale ashy-pink. The two middle feathers of the tail have no webs, except a very small one at the base and at the extreme tip, forming wire-like cirrhi, which spread out in an elegant double curve, and vary from twenty-four to thirty-four inches long. From each side of the body, beneath the wings, springs a dense tuft of long and delicate plumes, sometimes two feet in length, of the most intense golden-orange color and very glossy, but changing toward the tips into a pale brown. This tuft of plumage can be elevated and spread out at pleasure, so as almost to conceal the body of the bird.

These splendid ornaments are entirely confined to the male sex, while the female is really a very plain and ordinary-looking bird of a uniform coffee-brown color which never changes, neither does she possess the long tail wires, nor a single yellow or green feather about the head. The young males of the first year exactly resemble the females, so that they can only be distinguished by dissection. The first change is the acquisition of the yellow and green color on the head and throat, and at the same time the two middle tail feathers grow a few inches longer than the rest, but remain webbed on both sides. At a later period these feathers are replaced by the long bare shafts of the full length, as in the adult bird; but there is still no sign of the magnificent orange side plumes, which later still complete the attire of the perfect male. To effect these changes there must be at least three successive moultings; and as the birds were found by me in all the stages about the same time, it is probable that they moult only once a year, and that the full plumage is not acquired till the bird is four years old. It was long thought that the fine train of feathers was assumed for a short time only at the breeding season, but my own experience, as well as the observation of birds of an allied species which I brought home with me, and which lived two years, show that the complete plumage is retained during the whole year, except during a short period of moulting as with most other birds.

The Great Bird of Paradise is very active and vigorous, and seems to be in constant motion all day long. It is very abundant, small flocks of females and young males being constantly met with; and though the full-plumaged birds are less plentiful, their loud cries, which are heard daily, show that they also are very numerous. Their note is, "Wawk-wawk-wawk—Wök, wök-wök," and is so loud and shrill as to be heard a great distance, and to form the most prominent and characteristic animal sound in the Aru Islands. The mode of nidification is unknown; but the natives told me that the nest was formed of leaves placed on an ant's nest, or on some projecting limb of a very lofty tree, and they believe that it contains only one young bird. The egg is quite unknown, and the natives declared they had never seen it; and a very high reward offered for one by a Dutch official did not meet with success.

They moult about January or February, and in May, when they are in full plumage, the males assemble early in the morning to exhibit themselves in the singular manner which the natives call their "Sáceleli," or dancing-parties, in certain trees in the forest, which are not fruit trees as I at first imagined, but which have an immense head of spreading branches and large but scattered leaves, giving a clear space for the birds to play and exhibit their plumes. On one of these trees a dozen or twenty full-plumaged male birds assemble together, raise up their wings, stretch out their necks, and elevate their exquisite plumes, keeping them in a continual vibration. Between whiles they fly across from branch to branch in great excitement, so that the whole tree is filled with waving plumes in every variety of attitude and motion. The bird itself is nearly as large as a crow, and is of a rich coffee-brown color. The head and neck is of a pure straw-yellow above, and rich metallic green beneath. The long plummy tufts of golden-orange feathers spring from the sides beneath each wing, and when the bird is in repose are partly concealed by them. At the time of its excitement, however, the wings are raised vertically over the back, the head is bent down and stretched out, and the long plumes are raised up and expanded till they form two magnificent golden fans, striped with deep red at the base, and fading off into the pale brown tint of the finely divided and softly waving points. The whole bird is then overshadowed by them, the crouching body, yellow head, and emerald-green throat forming but the foundation and setting to the golden glory which waves above. When seen in this attitude the Bird of Paradise really deserves its name, and must be ranked as one of the most beautiful and most wonderful of living things.

This habit enables the natives to obtain specimens with comparative ease. As soon as they find that the birds have fixed upon a tree on which to assemble, they build a little shelter of palm leaves in a convenient place among the branches, and the hunter ensconces himself in

it before daylight, armed with his bow and a number of arrows terminating in a round knob. A boy waits at the foot of the tree, and when the birds come at sunrise, and a sufficient number have assembled, and have begun to dance, the hunter shoots with his blunt arrow so strongly as to stun the bird, which drops down, and is secured and killed by the boy without its plumage being injured by a drop of blood. The rest take no notice, and fall one after another till some of them take the alarm.

The native mode of preserving them is to cut off the wings and feet, and then skin the body up to the beak, taking out the skull. A stout stick is then run up through the specimen, coming out at the mouth. Round this some leaves are stuffed, and the whole is wrapped up in a palm spathe and dried in the smoky hut. By this plan the head, which is really large, is shrunk up almost to nothing, the body is much reduced and shortened, and the greatest prominence is given to the flowing plumage. Some of these native skins are very clean, and often have wings and feet left on; others are dreadfully stained with smoke, and all give a most erroneous idea of the proportions of the living bird.

The *Paradisea apoda*, as far as we have any certain knowledge, is confined to the main land of the Aru Islands, never being found in the smaller islands which surround the central mass. It is certainly not found in any of the parts of New Guinea visited by the Malay and Bugis traders, nor in any of the other islands where Birds of Paradise are obtained. But this is by no means conclusive evidence, for it is only in certain localities that the natives prepare skins, and in other places the same birds may be abundant without ever becoming known. It is therefore quite possible that this species may inhabit the great southern mass of New Guinea, from which Aru has been separated; while its near ally, which I shall next describe, is confined to the northwestern peninsula.

The LESSER BIRD OF PARADISE (*Paradisea papuana* of Bechstein, "Le petit Emeraude" of French authors) is a much smaller bird than the preceding, although very similar to it. It differs in its lighter brown color, not becoming darker or purpled on the breast; in the extension of the yellow color all over the upper part of the back and on the wing coverts; in the lighter yellow of the side plumes, which have only a tinge of orange, and at the tips are nearly pure white; and in the comparative shortness of the tail cirrhi. The female differs remarkably from the same sex in *Paradisea apoda* by being entirely white on the under surface of the body, and is thus a much handsomer bird. The young males are similarly colored, and as they grow older they change to brown, and go through the same stages in acquiring the perfect plumage as has already been described in the allied species. It is this bird which is most commonly used in ladies' head-dresses in this country, and also forms an important article of commerce in the East.

THE RED BIRD OF PARADISE.

The *Paradisaea papuana* has a comparatively wide range, being the common species on the main land of New Guinea, as well as on the islands of Mysol, Salwatty, Jobie, Biak, and Sook. On the south coast of New Guinea the Dutch naturalist, Muller, found it at the Oetanata River in longitude 136° east. I obtained it myself at Dorey; and the captain of the Dutch steamer *Etna* informed me that he had seen the feathers among the natives of Humboldt Bay, in 141° east longitude. It is very probable, therefore, that it ranges over the whole of the main land of New Guinea.

The true Paradise Birds are omnivorous, feeding on fruits and insects—of the former

preferring the small figs; of the latter, grasshoppers, locusts, and phasmas, as well as cockroaches and caterpillars. When I returned home, in 1862, I was so fortunate as to find two adult males of this species in Singapore; and as they seemed healthy, and fed voraciously on rice, bananas, and cockroaches, I determined on giving the very high price asked for them—£100—and to bring them to England by the overland route under my own care.

On my way home I staid a week at Bombay to break the journey, and to lay in a fresh stock of bananas for my birds. I had great difficulty, however, in supplying them with insect food; for in the Peninsular and Oriental steamers cockroaches were scarce, and it was only by setting traps in the store-rooms, and by hunting an hour every night in the fore-castle, that I could secure a few dozen of these creatures—scarcely enough for a single meal. At Malta, where I staid a fortnight, I got plenty of cockroaches from a bakehouse, and when I left with me several biscuit-tins' full as provision for the voyage home. We came through the Mediterranean in March, with a very cold wind; and the only place on board the mail-steamer where their large cage could be accommodated was exposed to a strong current of air down a hatch-way which stood open day and night, yet the birds never seemed to feel the cold. During the night journey from Marseilles to Paris it was a sharp frost; yet they arrived in London in perfect health, and lived in the Zoological Gardens for one and two years, often displaying their beautiful plumes to the admiration of the spectators. It is evident, therefore, that the Paradise Birds are very hardy, and require air and exercise rather than heat; and I feel sure that if a good-sized conservatory could be devoted to them, or if they could be turned loose in the tropical department of the Crystal Palace or the Great Palm House at Kew, they would live for many years.

The RED BIRD OF PARADISE (*Paradisaea rubra* of Viellot), though allied to the two birds already described, is much more distinct from them than they are from each other. It is about the same size as *Paradisaea papuana* (13 to 14 inches long), but differs from it in many particulars. The side plumes, instead of

being yellow, are rich crimson, and only extend about three or four inches beyond the end of the tail; they are somewhat rigid, and the ends are curved downward and inward, and are tipped with white. The two middle tail feathers, instead of being simply elongated and deprived of their webs, are transformed into stiff black ribbons a quarter of an inch wide, but curved like a split quill, and resembling thin half cylinders of horn or whalebone. When a dead bird is laid on its back it is seen that these ribbons take a curve or set, which brings them round so as to meet in a double circle on the neck of the bird; but when they hang downward, during life, they assume a spiral twist, and form an exceedingly graceful double curve. They are about twenty-two inches long, and always attract attention as the most conspicuous and extraordinary feature of the species. The rich metallic green color of the throat extends over the front half of the head to behind the eyes, and on the forehead forms a little double crest of scaly feathers, which adds much to the vivacity of the bird's aspect. The bill is gamboge-yellow, and the iris blackish-olive.

The female of this species is of a tolerably uniform coffee-brown color, but has a blackish head, and the nape, neck, and shoulders yellow, indicating the position of the brighter colors of the male. The changes of plumage follow the same order of succession as in the other species, the bright colors of the head and neck being first developed, then the lengthened filaments of the tail, and last of all, the red side plumes. I obtained a series of specimens, illustrating the manner in which the extraordinary black tail ribbons are developed, which is very remarkable. They first appear as two ordinary feathers, rather shorter than the rest of the tail; the second stage would no doubt be that shown in a specimen of *Paradisea apoda*, in which the feathers are moderately lengthened, and with the web narrowed in the middle; the third stage is shown by a specimen which has part of the midrib bare, and terminated by a spatulate web; in another the bare midrib is a little dilated and semi-cylindrical, and the terminal web very small; in a fifth the perfect black horny ribbon is formed, but it bears at its extremity a brown spatulate web; while in another a portion of the black ribbon itself bears, for a portion of its length, a narrow brown web. It is only after these changes are fully completed that the red side plumes begin to appear.

The Red Birds of Paradise are not shot with blunt arrows, as in the Aru Islands and some parts of New Guinea, but are snared in a very ingenious manner. A large climbing Arum bears a red reticulated fruit, of which the birds are very fond. The hunters fasten this fruit on a stout forked stick, and provide themselves with a fine but strong cord. They then seek out some tree in the forest on which these birds are accustomed to perch, and climbing up it fasten the stick to a branch, and arrange the cord

in a noose so ingeniously that when the bird comes to eat the fruit its legs are caught, and by pulling the end of the cord, which hangs down to the ground, it comes free from the branch and brings down the bird. Sometimes, when food is abundant elsewhere, the hunter sits from morning till night under his tree, with the cord in his hand, and even for two or three whole days in succession, without even getting a bite; while, on the other hand, if very lucky, he may get two or three birds in a day. There are only eight or ten men who practice this art.

Some few were brought me the same day they were caught, and I had an opportunity of examining them in all their beauty and vivacity. As soon as I found they were generally brought alive, I set one of my men to make a large bamboo cage with troughs for food and water, hoping to be able to keep some of them. I got the natives to bring me branches of a fruit they were very fond of, and I was pleased to find they ate it greedily, and would also take any number of live grasshoppers I gave them, stripping off the legs and wings, and then swallowing them. They drank plenty of water, and were in constant motion, jumping about the cage from perch to perch, clinging on the top and sides, and rarely resting a moment the first day till nightfall. The second day they were always less active, although they would eat as freely as before; and on the morning of the third day they were almost always found dead at the bottom of the cage, without any apparent cause. Some of them ate boiled rice as well as fruit and insects; but after trying many in succession, not one out of ten lived more than three days. The second or third day they would be dull, and in several cases they were seized with convulsions, and fell off the perch, dying a few hours afterward. I tried immature as well as full-plumaged birds, but with no better success, and at length gave it up as a hopeless task, and confined my attention to preserving specimens in as good a condition as possible.

The Red Bird of Paradise offers a remarkable case of restricted range, being entirely confined to the small island of Waigiou, off the northwest extremity of New Guinea, where it replaces the allied species found in the other islands.

The three birds just described form a well-marked group, agreeing in every point of general structure, in their comparatively large size, the brown color of their bodies, wings, and tail, and in the peculiar character of the ornamental plumage which distinguishes the male bird. The group ranges nearly over the whole area inhabited by the family of the *Paradiseidae*; but each of the species has its own limited region, and is never found in the same district with either of its close allies. To these three birds properly belongs the generic title *Paradisea*, or true Paradise Bird.

The next species is the *Paradisea regia* of Linnæus, or KING BIRD OF PARADISE, which differs so much from the three preceding spe-

THE KING AND TWELVE-WIRED BIRD OF PARADISE.

cies as to deserve a distinct generic name, and it has accordingly been called *Cicinnurus regius*. By the Malays it is called "Burong rajah," or King Bird, and by the natives of the Aru Islands "Goby-goby."

This lovely little bird is only about six and a half inches long, partly owing to the very short tail, which does not surpass the somewhat square wings. The head, throat, and entire upper surface are of the richest glossy crimson-red, shading to orange-crimson on the forehead, where the feathers extend beyond the nostrils more than half-way down the beak. The plumage is excessively brilliant, shining in certain lights with a metallic or glassy lustre. The breast and belly are pure silky white, between which color and the red of the throat

there is a broad band of rich metallic green, and there is a small spot of the same color close above each eye. From each side of the body, beneath the wing, springs a tuft of broad delicate feathers about an inch and a half long, of an ashy color, but tipped with a broad band of emerald-green, bordered within by a narrow line of buff. These plumes are concealed beneath the wing, but when the bird pleases, can be raised and spread out so as to form an elegant semicircular fan on each shoulder. But another ornament still more extraordinary, and if possible more beautiful, adorns this little bird. The two middle tail feathers are modified into very slender wire-like shafts, nearly six inches long, each of which bears at the extremity, on the inner side only, a web of an emerald-green

color, which is coiled up into a perfect spiral disk, and produces a most singular and charming effect. The bill is orange-yellow, and the feet and legs of a fine cobalt-blue.

The female of this little gem is such a plainly colored bird that it can at first sight hardly be believed to belong to the same species. The upper surface is of a dull earthy-brown, a slight tinge of orange-red appearing only on the margins of the quills. Beneath it is of a paler yellowish-brown, scaled and banded with narrow dusky markings. The young males are exactly like the female, and they no doubt undergo a series of changes as singular as those of *Paradisea rubra*; but, unfortunately, I was unable to obtain illustrative specimens.

This exquisite little creature frequents the smaller trees in the thickest parts of the forest, feeding on various fruits, often of a very large size for so small a bird. It is very active both on its wings and feet, and makes a whirring sound while flying, something like the South American manakins. It often flutters its wings and displays the beautiful fan which adorns its breast, while the star-bearing tail wires diverge in an elegant double curve. It is tolerably plentiful in the Aru Islands, which led to its being brought to Europe at an early period along with *Paradisea apoda*. It also occurs in the island of Mysol, and in every part of New Guinea which has been visited by naturalists.

We now come to the remarkable little bird called the MAGNIFICENT, first figured by Buffon, and named *Paradisea speciosa* by Boddaert, which, with one allied species, has been formed into a separate genus by Prince Bonaparte, under the name of *Diphyllodes*, from the curious double mantle which clothes the back.

The head is covered with short brown velvety feathers, which advance on the beak so as to cover the nostrils. From the nape springs a dense mass of feathers of a straw-yellow color, and about one and a half inches long, forming a mantle over the upper part of the back. Beneath this, and forming a band about one-third of an inch beyond it, is a second mantle of rich, glossy, reddish-brown feathers. The rest of the back is orange-brown, the tail coverts and tail dark bronzy, the wings light orange-buff. The whole under surface is covered with an abundance of plumage springing from the margins of the breast, and of a rich deep green color, with changeable hues of purple. Down the middle of the breast is a broad band of scaly plumes of the same color, while the chin and throat are of a rich metallic bronze. From the middle of the tail spring two narrow feathers of a rich steel-blue, and about ten inches long. These are webbed on the inner side

only, and curve outward, so as to form a double circle.

From what we know of the habits of allied species we may be sure that the greatly developed plumage of this bird is erected and displayed in some remarkable manner. The mass of feathers on the under surface are probably expanded into a hemisphere, while the beautiful yellow mantle is no doubt elevated so as to give the bird a very different appearance from that which it presents in the dried and flattened skins of the natives, through which alone it is at present known. The feet appear to be dark blue. This rare and elegant little bird is found only on the main land of New Guinea, and in the island of Mysol.

A still more rare and beautiful species than the last is the *Diphyllodes Wilsoni*, described by Mr. Cassin from a native skin in the rich museum of Philadelphia. The same bird was afterward named *Diphyllodes respublica* by Prince Bonaparte, and still later *Schlegelia calva* by Dr. Bernstein, who was so fortunate as to obtain fresh specimens in Waigiou.

In this species the upper mantle is sulphur-yellow, the lower one and the wings pure red, the breast plumes dark green, and the lengthened middle tail feathers much shorter than in the allied species. The most curious difference is, however, that the top of the head is bald, the bare skin being of a rich cobalt-blue, crossed by several lines of black velvety feathers.

It is about the same size as *Diphyllodes speciosa*, and is no doubt entirely confined to the island of Waigiou. The female, as figured and described by Dr. Bernstein, is very like that of *Cicinnurus regius*, being similarly banded beneath; and we may therefore conclude that its near ally, the "Magnificent," is at least equally plain in this sex, of which specimens have not yet been obtained.

The SUPERB BIRD OF PARADISE was first figured by Buffon, and was named by Boddaert *Paradisea atra*, from the black ground color of its plumage. It forms the genus *Lophorina* of

THE MAGNIFICENT BIRD OF PARADISE.

Viellot, and is one of the rarest and most brilliant of the whole group, being only known from mutilated native skins. This bird is a little larger than the "Magnificent." The ground color of the plumage is intense black, but with beautiful bronze reflections on the neck, and the whole head scaled with feathers of brilliant metallic green and blue. Over its breast it bears a shield formed of narrow and rather stiff feathers, much elongated toward the sides, of a pure bluish-green color, and with a satiny gloss. But a still more extraordinary ornament is that which springs from the back of the neck—a shield of a similar form to that on the breast, but much larger, and of a velvety black color, glossed with bronze and purple. The outermost feathers of this shield are half an inch longer than the wing, and when it is elevated it must, in conjunction with the breast shield, completely change the form and whole appearance of the bird. The bill is black, and the feet appear to be yellow.

This wonderful little bird inhabits the interior of the northern peninsula of New Guinea only. Neither I nor Mr. Allen could hear any thing of it in any of the islands or on any part of the coast. It is true that it was obtained from the coast natives by Lesson; but when at Sorong in 1861 Mr. Allen learned that it is only found three days' journey in the interior. Owing to these "Black Birds of Paradise," as they are called, not being so much valued as articles of merchandise, they now seem to be rarely preserved by the natives; and it thus happened that, during several years spent on the coasts of New Guinea and in the Moluccas, I was never able to obtain a skin. We are therefore quite ignorant of the habits of this bird, and also of its female, though the latter is no doubt as plain and inconspicuous as in all the other species of this family.

THE SUPERB BIRD OF PARADISE.

The GOLDEN, or SIX-SHAFTED PARADISE BIRD is another rare species, first figured by Buffon, and never yet obtained in perfect condition. It was named by Boddaert *Paradisea seepennis*, and forms the genus *Parotia* of Viellot. This wonderful bird is about the size of the female *Paradisea rubra*. The plumage appears at first sight black, but it glows in certain lights with bronze and deep purple. The throat and breast are scaled with broad flat feathers of an intense golden hue, changing to green and blue tints in certain lights. On the back of the head is a broad recurved band of feathers, whose brilliancy is indescribable, resembling the sheen of emerald and topaz rather than any organic substance. Over the forehead is a large patch of pure white feathers, which shine like satin; and from the sides of the head spring the six wonderful feathers from which the bird receives its name. These are slender wires, six inches long, with a small oval web at the extremity. In addition to these ornaments there is also an immense tuft of soft feathers on each side of the breast, which when elevated must entirely hide the wings, and give the bird an appearance of being double its real bulk. The bill is black, short, and rather compressed, with the feathers advancing over the nostrils, as in *Cicinnurus regius*. This singular and brilliant bird inhabits the same region as the "Superb Bird of Paradise;" and nothing whatever is known about it but what we can derive from an examination of the skins preserved by the natives of New Guinea.

THE SIX-SHAFTED BIRD OF PARADISE.

The STANDARD WING, named *Semioptera Wallacei* by Mr. G. R. Gray, is an entirely new form of Bird of Paradise, discovered by myself in the island of Batchian, and especially distinguished by a pair of long narrow feathers of a white color, which spring from among the short plumes which clothe the bend of the wing, and are capable of being erected at pleasure. The general color of this bird is a delicate olive-brown, deepening to a kind of bronzy-olive in the middle of the back, and changing to a del-

WALLACE'S STANDARD WING, MALE AND FEMALE.

icate ashy-violet with a metallic gloss on the crown of the head. The feathers, which cover the nostrils and extend half-way down the beak, are loose and curved upward. Beneath it is much more beautiful. The scale-like feathers of the breast are margined with rich metallic blue-green, which color entirely covers the throat and sides of the neck, as well as the long pointed plumes which spring from the sides of the breast, and extend nearly as far as the end of the wings. The most curious feature of the bird, however, and one altogether unique in the whole class, is found in the pair of long narrow delicate feathers which spring from each wing close to the bend. On lifting the wing coverts they are seen to arise from two tubular horny sheaths, which diverge from near the point of junction of the carpal bones. They are erectile,

and when the bird is excited are spread out at right angles to the wing and slightly divergent. They are from six to six and a half inches long, the upper one slightly exceeding the lower. The total length of the bird is eleven inches. The bill is horny-olive, the iris deep olive, and the feet bright orange.

The female bird is remarkably plain, being entirely of a dull pale earthy-brown, with only a slight tinge of ashy-violet on the head to relieve its general monotony; and the young males exactly resemble her.

This bird frequents the lower trees of the forests, and, like most Paradise Birds, is in constant motion—flying from branch to branch, clinging to the twigs and even to the smooth and vertical trunks almost as easily as a woodpecker. It continually utters a harsh, creaking

note, somewhat intermediate between that of *Paradisea apoda* and the more musical cry of *Cicinnurus regius*. The males at short intervals open and flutter their wings, erect the long shoulder feathers, and spread out the elegant green breast shields.

The "Standard Wing" is found in Gilolo as well as in Batchian, and all the specimens from the former island have the green breast shield rather longer, the crown of the head darker violet, and the lower parts of the body rather more strongly scaled with green. This is the only Paradise Bird yet found in the Moluccan district, all the others being confined to the Papuan Islands and North Australia.

We now come to the *Epimachidæ*, or "Long-billed Birds of Paradise," which, as before stated, ought not to be separated from the *Paradiseidæ* by the intervention of any other birds. One of the most remarkable of these is the "Twelve-wired Paradise Bird," *Paradisea alba* of Blumenbach, but now placed in the genus *Seleucides* of Lesson.

This bird is about twelve inches long, of which the compressed and curved beak occupies two inches. The color of the breast and upper surface appears at first sight nearly black, but a close examination shows that no part of it is devoid of color, and by holding it in various lights the most rich and glowing tints become visible. The head, covered with short velvety feathers, which advance on the chin much further than on the upper part of the beak, is of a purplish-bronze color; the whole of the back and shoulders is rich bronzy-green, while the closed wings and tail are of the most brilliant violet-purple, all the plumage having a delicate silky gloss. The mass of feathers which cover the breast is really almost black, with faint glosses of green and purple, but their outer edges are margined with glittering bands of emerald-green. The whole lower part of the body is rich buffy-yellow, including the tuft of plumes which spring from the sides, and extend an inch and a half beyond the tail. When skins are exposed to the light the yellow fades into dull white, from which circumstance it derived its specific name. About six of the innermost of these plumes on each side have the midrib elongated into slender black wires, which bend at right angles, and curve somewhat backward to a length of about ten inches, forming one of those extraordinary and fantastic ornaments with which this group of birds abounds. The bill is jet black, and the feet bright yellow.

The female, although not quite so plain a bird as in some other species, presents none of the gay colors or ornamental plumage of the male. The top of the head and back of the neck are black, the rest of the upper parts rich reddish-brown; while the under surface is entirely yellowish-ashy, somewhat blackish on the breast, and crossed throughout with narrow blackish wavy bands.

The *Seleucides alba* is found in the island of Salwatty, and in the northwestern parts of New

Guinea, where it frequents flowering trees, especially sago-palms and pandani, sucking the flowers, round and beneath which its unusually large and powerful feet enable it to cling. Its motions are very rapid. It seldom rests more than a few moments on one tree, after which it flies straight off, and with great swiftness, to another. It has a loud shrill cry, to be heard a long way, consisting of "Cáh, cáh," repeated five or six times in a descending scale, and at the last note it generally flies away. The males are quite solitary in their habits, although, perhaps, they assemble at certain times like the true Paradise Birds. All the specimens shot and opened by my assistant Mr. Allen, who obtained this fine bird during his last voyage to New Guinea, had nothing in their stomachs but a brown sweet liquid, probably the nectar of the flowers on which they had been feeding. They certainly, however, eat both fruit and insects, for a specimen which I saw alive on board a Dutch steamer ate cockroaches and papaya fruit voraciously. This bird had the curious habit of resting at noon with the bill pointing vertically upward. It died on the passage to Batavia, and I secured the body and formed a skeleton, which shows indisputably that it is really a Bird of Paradise. The tongue is very long and extensible, but flat and a little fibrous at the end, exactly like the true *Paradiseas*.

In the island of Salwatty the natives search in the forests till they find the sleeping place of this bird, which they know by seeing its dung upon the ground. It is generally in a low bushy tree. At night they climb up the tree, and either shoot the birds with blunt arrows, or even catch them alive with a cloth. In New Guinea they are caught by placing snares on the trees frequented by them, in the same way as the Red Paradise Birds are caught in Wai-gion, and which has already been described.

The great "Epimaque," or LONG-TAILED

THE LONG-TAILED BIRD OF PARADISE.

PARADISE BIRD (*Epimachus magnus*), is another of these wonderful creatures, only known by the imperfect skins pre-

pared by the natives. In its dark velvety plumage, glossed with bronze and purple, it resembles the *Seleucides alba*, but it bears a magnificent tail more than two feet long, glossed on the upper surface with the most intense opalescent blue. Its chief ornament, however, consists in the group of broad plumes which spring from the sides of the breast, and which are dilated at the extremity, and banded with the most vivid metallic blue and green. The bill is long and curved, and the feet black, and similar to those of the allied forms. The total length of this fine bird is between three and four feet.

This splendid bird inhabits the mountains of New Guinea, in the same district with the "Superb" and the "Six-shafted" Paradise Birds, and I was informed is sometimes found in the ranges near the coast. I was several times assured by different natives that this bird makes its nest in a hole under-ground, or under rocks, always choosing a place with two apertures, so that it may enter at one and go out at the other. This is very unlike what we should suppose to be the habits of the bird, but it is not easy to conceive how the story originated if it is not true; and all travelers know that native accounts of the habits of animals, however strange they may seem, almost invariably turn out to be correct.

The SCALE-BREADED PARADISE BIRD (*Epimachus magnificus* of Cuvier) is now generally placed with the Australian Rifle birds in the genus *Ptiloris*. Though very beautiful, these birds are less strikingly decorated with accessory plumage than the other species we have been describing, their chief ornament being a more or less developed breast-plate of stiff metallic green feathers, and a small tuft of somewhat hairy plumes on the sides of the breast. The back and wings of this species are of an intense velvety black, faintly glossed in certain lights with rich purple. The two broad middle tail feathers are opalescent green-blue with a velvety surface, and the top of the head is covered with feathers resembling scales of burnished steel. A large triangular space covering the chin, throat, and breast is densely scaled with feathers, having a steel-blue or green lustre, and a silky feel. This is edged below with a narrow band of black, followed by shiny bronzy-green, below which the body is covered with hairy feathers of a rich claret color, deepening to black at the tail. The tufts of side plumes somewhat resemble those of the true Birds of Paradise, but are scanty, about as long as the tail, and of a black color. The sides of the head are rich violet, and velvety feathers extend on each side of the beak over the nostrils.

I obtained at Dorey a young male of this bird, in a state of plumage which is no doubt that of the adult female, as is the case in all the allied species. The upper surface, wings, and tail are rich reddish-brown, while the under surface is of a pale ashy color, closely barred throughout with narrow wavy black bands. There is also a pale-banded stripe over

the eye, and a long dusky stripe from the gape down each side of the neck. This bird is fourteen inches long, whereas the native skins of the adult male are only about ten inches, owing to the way in which the tail is pushed in, so as to give as much prominence as possible to the ornamental plumage of the breast.

At Cape York, in North Australia, there is a closely allied species, *Ptiloris Alberti*, the female of which is very similar to the young male bird here described. The beautiful Rifle birds of Australia, which much resemble these Paradise Birds, are named *Ptiloris paradiseus* and *Ptiloris Victorice*. The Scale-breasted Paradise Bird seems to be confined to the main land of New Guinea, and is less rare than several of the other species.

There are three other New Guinea birds which are by some authors classed with the Birds of Paradise, and which, being almost equally remarkable for splendid plumage, deserve to be noticed here. The first is the "Paradise Pie" (*Astrapia nigra* of Lesson), a bird of the size of *Paradisea rubra*, but with a very long tail, glossed above with intense violet. The back is bronzy-black, the lower parts green, the throat and neck bordered with loose broad feathers of an intense coppery hue, while on the top of the head and neck they are glittering emerald-green. All the plumage round the head is lengthened and erectile, and when spread out by the living bird must have an effect hardly surpassed by any of the true Paradise Birds. The bill is black and the feet yellow. The *Astrapia* seems to me to be somewhat intermediate between the *Paradiseidae* and *Epimachidae*.

There is an allied species, having a bare carunculated head, which has been called *Paradigalla carunculata*. It is believed to inhabit, with the preceding, the mountainous interior of New Guinea, but is exceedingly rare, the only known specimen being in the Philadelphia Museum.

The PARADISE ORIOLE is another beautiful bird, which is now sometimes classed with the Birds of Paradise. It has been named *Paradisea aurea* and *Oriolus aureus* by the old naturalists, and is now generally placed in the same genus as the Regent Bird of Australia (*Sericulus chrysocephalus*). But the form of the bill and the character of the plumage seem to me to be so different that it will have to form a distinct genus. This bird is almost entirely yellow, with the exception of the throat, the tail, and part of the wings and back, which are black; but it is chiefly characterized by a quantity of long feathers of an intense glossy orange color, which cover its neck down to the middle of the back, almost like the hackles of a game-cock.

This beautiful bird inhabits the main land of New Guinea, and is also found in Salwatty, but is so rare that I was only able to obtain one imperfect native skin, and nothing whatever is known of its habits.

I will now give a list of all the Birds of Paradise yet known, with the places they are believed to inhabit.

1. *Paradisea apoda* (The Great Paradise Bird). Aru Islands.
2. *Paradisea papuana* (The Lesser Paradise Bird). New Guinea, Mysol, Jobie.
3. *Paradisea rubra* (The Red Paradise Bird). Waigiou.
4. *Cicinnurus regius* (The King Paradise Bird). New Guinea, Aru Islands, Mysol, Salwatty.
5. *Diphyllodes speciosa* (The Magnificent). New Guinea, Mysol, Salwatty.
6. *Diphyllodes Wilsoni* (The Red Magnificent). Waigiou.
7. *Lophorina atra* (The Superb). New Guinea.
8. *Parotia sexpennis* (The Golden Paradise Bird). New Guinea.
9. *Semioptra Wallacei* (The Standard Wing). Batcian, Gilolo.
10. *Epimachus magnus* (The Long-tailed Paradise Bird). New Guinea.
11. *Seleucides alba* (The Twelve-wired Paradise Bird). New Guinea, Salwatty.
12. *Ptiloris magnifica* (The Scale-breasted Paradise Bird). New Guinea.
13. *Ptiloris Alberti* (Prince Albert's Paradise Bird). North Australia.
14. *Ptiloris paradisea* (The Rifle Bird). East Australia.
15. *Ptiloris Victorie* (The Victorian Rifle Bird). Northeast Australia.
16. *Astrapia nigra* (The Paradise Pie). New Guinea.
17. *Paradigalla carunculata* (The Carunculated Paradise Pie). New Guinea.
18. (?) *Sericulus aureus* (The Paradise Oriole). New Guinea, Salwatty.

We see, therefore, that of the eighteen species which seem to deserve a place among the Birds of Paradise, eleven are known to inhabit the great island of New Guinea, eight of which are entirely confined to it and the hardly separated island of Salwatty. But if we consider those islands which are now united to New Guinea by a shallow sea to really form a part of it, we shall find that fourteen of the Paradise Birds belong to that country, while three inhabit the northern and eastern parts of Australia, and one the Moluccas. All the more extraordinary and magnificent species are, however, entirely confined to the Papuan region.

Although I devoted so much time to a search after these wonderful birds, I only succeeded myself in obtaining five species during a residence of many months in the Aru Islands, New Guinea, and Waigiou. Mr. Allen's voyage to Mysol did not procure a single additional species, but we both heard of a place called Sorong, on the main land of New Guinea, near Salwatty, where we were told that all the kinds we desired could be obtained. We therefore determined that he should visit this place, and endeavor to penetrate into the interior among the natives, who actually shoot and skin the Birds of Paradise. He went in the small prau I had fitted up at Goram, and through the kind assistance of the Dutch Resident at Ternate, a lieutenant and two soldiers were sent by the Sultan of Tidore to accompany and protect him, and to assist him in getting men and in visiting the interior.

Notwithstanding these precautions, Mr. Allen met with difficulties in this voyage which we had neither of us encountered before. To understand these it is necessary to consider that the Birds of Paradise are an article of commerce, and are the monopoly of the chiefs of the coast villages, who obtain them at a low rate from the mountaineers and sell them to the Bugis traders. A portion is also paid every year as tribute to the Sultan of Tidore. The natives are therefore very jealous of a stranger, especially a European, interfering in their trade, and above all of going into the interior to deal with the mountaineers themselves. They of course think he will raise the prices in the interior, and lessen the supply on the coast, greatly to their disadvantage; they also think their tribute will be raised if a European takes back a quantity of the rare sorts; and they have besides a vague and very natural dread of some ulterior object in a white man's coming, at so much trouble and expense, to their country only to get Birds of Paradise, of which they know he can buy plenty (of the common yellow ones which alone they value) at Ternate, Macassar, or Singapore.

It thus happened that when Mr. Allen arrived at Sorong, and explained his intention of going to seek Birds of Paradise in the interior, innumerable objections were raised. He was told it was three or four days' journey over swamps and mountains; that the mountaineers were savages and cannibals, who would certainly kill him; and, lastly, that not a man in the village could be found who dare go with him. After some days spent in these discussions, as he still persisted in making the attempt, and showed them his authority from the Sultan of Tidore to go where he pleased and receive every assistance, they at length provided him with a boat to go the first part of the journey up a river; at the same time, however, they sent private orders to the interior villages to refuse to sell any provisions, so as to compel him to return. On arriving at the village where they were to leave the river and strike inland the coast people returned, leaving Mr. Allen to get on as he could. Here he called on the Tidore lieutenant to assist him, and procure men as guides and to carry his baggage to the villages of the mountaineers. This, however, was not so easily done. A quarrel took place, and the natives, refusing to obey the imperious orders of the lieutenant, got out their knives and spears to attack him and his soldiers; and Mr. Allen himself was obliged to interfere to protect those who had come to guard him. The respect due to a white man, and the timely distribution of a few presents, prevailed; and, on showing the knives, hatchets, and beads he was willing to give to those who accompanied him, peace was restored, and the next day, traveling over a frightfully rugged country, they reached the villages of the mountaineers. Here Mr. Allen remained a month without any interpreter through whom he could understand a word or

communicate a want. However, by signs and presents and a pretty liberal barter, he got on very well, some of them accompanying him every day in the forest to shoot, and receiving a small present when he was successful.

In the grand matter of the Paradise Birds, however, little was done. Only one additional species was found, the *Seleucides alba*, of which he had already obtained a specimen in Salwatty; but he learned that the other kinds, of which he showed them drawings, were found two or three days' journey farther in the interior. When I sent my men from Dorey to Amberbaki, they heard exactly the same story—that the rarer sorts were only found several days' journey in the interior, among rugged mountains, and that the skins were prepared by savage tribes who had never even been seen by any of the coast people.

It seems as if Nature had taken precautions that these her choicest treasures should not be made too common, and thus be undervalued. This northern coast of New Guinea is exposed to the full swell of the Pacific Ocean, and is rugged and harborless. The country is all rocky and mountainous, covered every where with dense forests, offering in its swamps and precipices and serrated ridges an almost impassable barrier to the unknown interior; and the people are dangerous savages, in the very lowest stage of barbarism. In such a country, and among such a people, are found these wonderful productions of Nature, the Birds of Paradise, whose exquisite beauty of form and color and strange developments of plumage are calculated to excite the wonder and admiration of the most civilized and the most intellectual of mankind, and to furnish inexhaustible materials for study to the naturalist, and for speculation to the philosopher.

Thus ended my search after these beautiful birds. Five voyages to different parts of the district they inhabit, each occupying in its preparation and execution the larger part of a year, produced me only five species out of the fourteen known to exist in the New Guinea district. The kinds obtained are those that inhabit the coasts of New Guinea and its islands, the remainder seeming to be strictly confined to the central mountain ranges of the northern peninsula; and our researches at Dorey and Amberbaki, near one end of this peninsula, and at Salwatty and Sorong, near the other, enable me to decide with some certainty on the native country of these rare and lovely birds, good specimens of which have never yet been seen in Europe.

A NIGHT AT SEA.

"I UNDERSTAND that it is a common failing of mothers to be jealous of their daughters-in-law," lisped Mr. Sydney Grayson, buttering his remark on one side with a smile and on the other with a bow.

Conscious that he had risen to his full intellectual height to say this, remembering that he

had never before been so original and profound, a sublime tremor of self-respect ran in chills down his back, and the bow which he made was partly to himself.

The moment and the environment called for grandeur of mental action. For the first time in his life he was voyaging beyond sight of land without being too sea-sick to properly appreciate the fact. Under his polished boots was a bark with the Oriental title of *Osmanti*, hailing from New York, or, as Mr. Grayson delighted to call it, "the Metropolis of the Western World," and bound for Smyrna, a city which, as he frequently stated, lay in "the Land of the East, the clime of the Sun." Above him were bellying sails, glorious, unearthly, ghostly in the transforming effulgence of moonlight; and around him was a sparkling expanse which he was graciously pleased to flatter as "the ilimitable ocean."

"I have often noted that peculiarity in mothers," continued Mr. Grayson. "I venture to believe that I can understand Mrs. Gordon's feelings perfectly. She has an only son, and she wants to monopolize him. She is jealous of her son's wife. And I must admit," he smiled and puckered, "that she has a dangerous rival. If I were your respected mother-in-law I should die of despair. Really now, Mrs. Gordon, I think I should."

The person with whom he thus discoursed—like the majority of persons with whom this old beau had spent his life in discoursing—was a young lady. Harriet Gordon, the wife of George Gedney Gordon, always sufficiently pretty, was just now strikingly beautiful. Her complexion dazzled; it did not seem earthly, and, indeed, altogether earthly it was not; something of its purity and glory descended from the heavens; she was transfigured by glamour of moonlight.

"Yes, she has got him," continued Hattie Gordon, failing to notice the compliment of Grayson, and glancing backward at a couple who sat leaning against the taffrail. "She has carried him off; she has got him all to herself; she has cut me out. I presume she is perfectly happy."

"It would be a pity to disturb her innocent pleasure," suggested the veteran beau, who enjoyed walking a moonlit deck with a pretty woman.

"I don't understand it," persisted Hattie. "Why should a mother be jealous of her son's wife? Can't she remember that I belong to him—that I am part of him? It is my place by his side, I suppose. But if she finds us together she fairly glowers."

Here she stopped her tirade and burst into a gay little laugh.

"Very amusing," bowed Syd Grayson. "You put a very absurd and amusing light upon the—the circumstances."

"I was thinking of this," she explained. "Imagine a marriage: somebody steps forward and says, 'I forbid the bans; the gentleman has a mother living!'"

The point was too fine and too tersely put for Grayson to see it; but he bowed, rubbed his hands, and smiled appreciatively, as he had learned to do.

Hattie Gordon now changed the subject, remembering that this talking to strangers about her intimate affairs was one of her habitual faults, and one of the things for which her husband most frequently reprov'd her. Undoubtedly he was partly to blame for it: he had not sufficient sympathy for her, and did not call out her confidences; moreover, he had allowed his mother to step in between her and himself. But notwithstanding these excuses, she felt that she was wrong in laying open family matters to even so old a gentleman as Mr. Grayson, and she turned the conversation upon other topics.

For Sydney Grayson was not a young gentleman. Even by moonlight you could see that he had been obliging enough to live for fifty years on earth, and that, while performing this good office toward his fellow-creatures, he had not been incessantly respected by the fingers of time. His long, waving hair, originally jet black, was streaked with silver. A small semicircle of white on either cheek stained the unity of his otherwise ebony whiskers and beard. His high, narrow forehead seemed still narrower in consequence of the hollowness of his bare and veined temples; and the lower part of his face, puckered with wrinkles which had once been smiles and dimples, was also narrow, even to weakness. His aquiline nose would have been handsome had it not been ground too fine on the grindstone of years. His mouth was thin-lipped and feeble, and his chin was at once too small and too pointed. His form was that of a tall and slender skeleton, slightly deformed by a stoop in the narrow shoulders, yet not deficient in grace of port and movement. A coffee-colored complexion, which complained of dyspepsia, and still more of malaria, hinted that he was a Southerner; and his elaborate polish of manner and courtliness of voice and affluence of compliment confirmed the flattering suspicion.

The promenade continued. Syd Grayson rehearsed anew that inane, pointless courtship which he had already inflicted upon more than one. Mrs. Gordon slyly and smilingly chaffed him, as he had been chaffed unnumbered times before. He talked, flattered, simpered, and bowed merely to gratify his antiquated vanity. She, even while she laughed at him, was not interested by him; she was thinking of the reserve of her husband and the unfriendliness of his mother. They two made her life thorny—the man not meaning it, the woman intentionally.

At every turn in her walk she glanced uneasily and anxiously at the couple. Why did they sit there, always silent or whispering, like conspirators? Why did they not join her in her promenade, or beckon her to join them in their conference? She would have been glad

to drop the old beau; it would almost have pleased her to see him tumble overboard; she half hated him because he helped to keep her apart from her husband. At the same time she would not go to George until he would signify in some way his desire to have her near him. Long enough had she shivered under indifference; at last it was time to show that she could endure to be left alone. So Hattie Gordon stubbornly remained in that solitude which was implied in a tête-à-tête with grinning, lisping, shallow Syd Grayson.

Let us now glance at the husband and the mother-in-law. They are side by side, upon two camp-stools, leaning against the after-bulwark; they are engaged in monotoned, gestureless, but earnest conversation; the mother's hand rests upon the son's arm. You can see in their faces that life with them has been, and always will be, a painfully serious matter. Neither ever jokes; neither is capable of joking, scarcely of laughing. Not the slightest gleam of humor ever radiates from their souls to lighten the solemnity of events and surroundings. They are the sort of people who can not perceive the fun of an accident or the ludicrousness of a bore. Not that they are melancholic; not that they are shrouded by religious asceticism; but they are gravely and even grimly in earnest. They were born to be Puritans, and they would certainly have fruited into full Puritanism had they been New Englanders instead of Virginians.

"I think I have cause now to hope that my life will not be wholly in vain," George Gordon was saying. "I can not but think that within two years' time I shall be well grounded in both the ancient and modern Greek. I shall set hard to work as soon as we reach Athens. You mustn't expect me to run about the Orient with you. Smyrna we shall see on the way. Then if you want to visit Constantinople you can run up there with Hattie under the care of some of our traveling countrymen. You and Hattie won't mind being left alone a good deal, I hope. I must study with all my might."

"I shall not mind it, for your sake," replied the mother. "As for Hattie, she must learn to bear it. If I can, she can."

There was a slightly unpleasant tone of insinuation in the closing phrase. Satirical it was not; satire was too much like a joke for this woman to be capable of it; her meaning was rather in the nature of a direct scoff. It seemed as if she wished to say, Your wife is not wrapped up in you as I am, and she will easily learn to dispense with your society.

Without noticing the ugly hint, or without caring to remark upon it, George continued to talk of his future.

"I shall be well fitted for my professorship. I shall be the first Professor of the University of Virginia to possess a speaking knowledge of Greek. If I am not unreasonably confident, I shall be valuable to my Alma Mater. That will be the acme of my ambition. If I can

only earn the consciousness of filling that chair worthily, it seems to me that I shall die happy. It will not have been a misspent life."

"No, George," returned the mother, eagerly. "It will be a noble life. You don't know how proud I shall be of you."

A mother is so much more sympathetic than any other being; she is so much more sympathetic even than the most loving of wives! She hopes, she confides, she believes with the incomparable earnestness of an affection which for itself demands nothing but affection. She enters fervidly into every plan of her boy; she is joyfully convinced that he will succeed; much more than that, she is sure that he has succeeded; she is content with him. If he seems to fail she does not blame him; he, her loved one, can not be in fault; she suspects some envious human enemy; or she brings in providence guilty. She is always encouraging; he shall have every opportunity to try fortune anew; the next time he will triumph. For his sake she is willing to endure poverty, the lack of those superfluities which are woman's necessities, the neglect of that society whose favor was once her breath of life. A wife may care for such trials; a mother counts them as feathers. In her youth she may have been selfish, demanding her own way and pleasure; but now, in presence of her struggling son, all that is over; the only way which she desires is his.

"I am exceedingly grateful, mother, for your sympathy," said George Gordon. "It encourages me more than I can tell you. It is so hard to do any thing worthy! A man has to work so many years before he can accomplish any thing! All that time the masses of his fellow-creatures do not believe in him. He feels slighted. He seems to be put aside. At times he is discouraged. Then to have one sympathetic and constant friend, some one always ready to say a cheering word, it is really priceless. Mother, I can never repay my obligations to you."

"Yes you can, George, and you will. When you have become what you want to be, and what you are sure to be, I shall be paid. I have no anxiety on that score."

Let us look a little more closely at these two earnest people. George Gordon, at this time only twenty-eight years old, is one of the gravest of men, and yet one of the most excitable. His intensely black eyes are at once cold and fiery, at once solemn and passionate. All through his sallow, contracted, hatchet face, in the hollowness of his cheeks, in the thinness of his flexible lips, in the muscles which play visibly over his jaws, in the wrinkles which cross the corners of his eyes and mouth, you can read a wearying and yet tireless earnestness. He converses in a slow, measured monotone which, in spite of him, emphasizes every word. He makes no gestures, except that now and then he clutches his right hand spasmodically, or closes his eyes slowly, like one who strives for

patience under pain. All his life he has been struggling to repress his nervousness; even in his childhood he was engaged in this woeful conflict; no youth, no years of gamesomeness, no kittenhood.

Larger than he, as much above the average size of her sex as he is below that of his, his mother is a nobly-fashioned woman with a superb air. But, in spite of this generous physique and the softening effect of a blonde complexion, she is like him in gravity and repression, like him in eagerness. In her fixed, clear gray eye you can perceive that she desires what she desires with all her might, and that she is stonily indifferent to all else. No light side-glances at life; no sensibility to temporary interests and passing enjoyments; one object in view, and that passionately. For years back, as we have already divined, the sole purpose of Mrs. Gordon's existence has been the success, the happiness, the glory of her son.

"I wish Hattie felt more of your interest in my projects," said the young husband, somewhat mournfully. "I suppose, however, that she can not. To a person brought up in so large a city as Philadelphia it can not seem much to be Professor in the University of Virginia. I don't blame her."

"I do," cried Mrs. Gordon, so loudly that her son started and glanced at his wife.

"What right has a woman to be indifferent to what concerns her husband?" pursued the mother.

George was disposed not to reply; for this matter of Hattie's lack of sympathy with his pursuits had long been a sore one to him, and he dreaded to talk of it lest he should go on to brood over it and his heart should fester more deeply. But, after a moment of hesitation, he made an attempt to defend his wife, not so much against his mother's words as against his own thoughts.

"I suppose that in the North," he said, "women are less absorbed in the family life than they are with us."

Mrs. Gordon was not philosophical. She could see that a general law might include, but not that it might excuse, an individual; she was not the kind of person to pardon a man for being a Turk because he was born in Constantinople. Moreover, one of Hattie's chiefest sins, in her eyes, was her Northern origin. When she replied, "George, I warned you not to marry a Yankee," she meant to be severe, although she did not mean to be malignant.

The truth is that this woman was not only greedy of her son's affection, but also of domestic power. Excessively proud of the name of Gordon, and holding that to be mistress of a Gordon household was a high title to human reverence, she had received her daughter-in-law into the family mansion with a spasm of jealousy. When she had resigned to her the head of the table she had felt like a queen forced to abdicate by a rival.

Soon there were misunderstandings: the new-

comer wished to introduce Northern fashions and elegancies; the old Virginian matron resisted the innovations; they were useless, unbecoming, extravagant. The wife was astonished and hurt by this opposition to her pretty little projects of decoration. The elder Mrs. Gordon had a frankness, an energy, almost a brutality of criticism which was excessively irritating to a girl who had expected to please entirely and easily. The differences between the two shortly developed into a covert warfare.

We know the general fashion of feminine hostilities—the mock admiration, the satirical glances, the little digs. The elder lady soon found that she was no match in this fencing for a girl who had learned to handle her rapier in the *salle d'armes* of city society. She was wounded without knowing how, and made wretched even in her victories. But she had one strong buckler: she loved her son with unalterable fervor; nothing could drive her from his side. The wife might agree with him or disagree with him, but the mother always held his opinion and shared his feelings. The result of this constancy was that she finally made him her ally, and through him governed the family.

A sad triumph in itself, it was the more sad because she did not forgive her defeated rival. At every favorable moment George's ears were filled with whisperings of Hattie's extravagance, Hattie's levity of behavior, and even Hattie's coquetry. Mrs. Gordon's dislike of her son's wife had become, as it were, a part of her affection for her son. She pitied him because he had bound himself to a girl so unworthy of him; a girl who did not sympathize in his aspirations and constantly prophesy his success; who did not see that he always had his favorite dishes for dinner; who did not strictly attend to the buttons on his shirts; who made herself agreeable to other gentlemen. The mother-in-law's hate was bitter just in proportion as the mother's love was ardent.

When George Gordon decided to study Greek at Athens his wife hoped to have him at last to herself. But the mother was not capable of being left behind; with an aching heart she packed trunks which had reposed for thirty years; with tears in her eyes she closed the revered family mansion. She had her reasons for accompanying the young couple: "You will spend twice your income," she said, "if I am not with you." Hattie's extravagance was an arm which Mrs. Gordon seldom let go out of her hand for a day together.

And when Mr. Sydney Grayson seized the opportunity of voyaging for his health in pleasant company, this merciless mother felt herself justified in suggesting that it would be well to have some one to matronize Hattie. "She has such flighty city ways, I am sorry to say, George, that she might lead that old beau to make a fool of himself."

So here they were, as we have found them, the wife left to walk the deck with Grayson, and

the husband sitting, so to speak, in the lap of the mother.

It will be remembered that Mrs. Gordon had dared to utter the cruel words, "George, I warned you not to marry a Yankee."

"They don't value domestic life," she continued, rapidly. "You have just said it, George, and it is true. They don't give up the world for their husbands. They are apt to be flirts. You can judge for yourself, George. Just look at Hattie giggling and chattering with Syd Grayson, instead of sitting with us. She finds it very dull to talk about your professorship and your studies. But she doesn't find that silly old gallant dull."

George did not remonstrate with his mother for criticising his wife. He had formerly remonstrated, but it had done little good, and he had stopped. In fact, he had come to take sides against Hattie, and to judge her with severity. Just now, too, he was specially vexed with her, not because she promenaded with Syd Grayson, but because she did not sit with her household. His feeling was that, being a Gordon, she ought to stay with Gordons and talk about Gordon affairs; and it seemed to him that when she did not do this she was in a manner unfaithful to the oath which she had taken at the altar.

"I doubt whether she would come to us if you should ask her," continued Mrs. Gordon.

The hot blood boiled in George's heart; he raised his head and called loudly, "Hattie!"

The sharp tone struck a spark of anger in the young wife, and her hand trembled on her companion's arm.

"I will come presently," she replied. "Mr. Grayson is telling me a story."

"What did I say, George?" was the venomous whisper of the mother.

"She will be here directly," replied the young man, sullenly. There was a moment of silence, during which George struggled to recover his self-possession, and sought to reprove himself for his childish outcry of authority. When his wife at last approached him and detached herself from the arm of Grayson, he rose and offered her his seat, saying calmly, "I am afraid that you will tire yourself with walking."

"Thank you," replied Hattie, taking the camp-stool. "I am tired."

"I owe you a thousand apologies, Mrs. Gordon," simpered Grayson. "Really, it distresses me beyond measure to think that I have fatigued you."

"Oh, I am not tired of you, Mr. Grayson," laughed Hattie. "But walking on this unsteady footing does weary one."

For a minute or two both the men were full of attentions for the young lady. George wished to offer amends for the sharp tone which he had sent after her, while the old bachelor, glowing with the thought that he had made a husband's eyes green, was anxious to pursue his gay victory. The elder Mrs. Gordon trembled inwardly with jealousy and aversion. Not only did it

annoy her horribly to see George address Hattie with tenderness, but she disliked the girl to that extent that she could not well bear to sit near her. Presently she rose and said, "The air is too chilly for me, and I shall retire."

"Allow me," cried Syd Grayson, the indefatigable gallant, sliding up with protruded arm. "Do me the honor. I could not think of letting you go down those stairs unassisted, Mrs. Gordon."

The moment George was left alone with his wife he quivered with an unwise impulse to call her to account, he scarcely knew for what. He was in that irritable state of mind which determines a man to have a grievance and to avenge it.

"I hope you have enjoyed your walk with Mr. Grayson," he said.

She was accustomed to be reproved by him, and understanding that she was being reproved now, she retorted, "I hope you have enjoyed your interview with your mother."

"I *have* enjoyed it—as I *ought*," was his icy answer.

The phrase and the accent seemed to imply that she had violated some duty in prattling and laughing with that old beau, who was not a Gordon. She resented the insinuation, and she proceeded to avenge it indirectly, after the adroit fashion of women.

"I find it terribly stupid on this little dot of a vessel, with so few passengers," she said. "I wish we could have gone by steamer, and across the Continent. There would have been some pleasure in that."

"You know that we could not have done that without exceeding our income," he observed. "I have explained that to you repeatedly."

She had that indifference or dullness as to the evils of running in debt which characterizes women, and in general such persons as are not obliged to earn money. It was one of her faults; he had often groaned over it; sometimes reproached her with it. It was one of the traits which had led him to think poorly of her intellect, and to fall into the way of deciding upon his plans without consulting her wishes.

"It is not pleasant, either, to be told that you find my mother's society and mine stupid," he added, turning to a bitterer grievance and growing immediately angry over it. "I should like to know what you mean by quitting us evening after evening to walk with that old simpleton."

"Mr. Grayson is at least civil," was the satirical comment on this violent speech.

George was terribly wounded; he stood charged with being less of a gentleman than Syd Grayson; he quivered under the accusation as if it had been a dagger-thrust. The nervous irritability against which he had maintained a life-long struggle rose like a giant upon his reason and obtained the mastery over it. His eyes were full of blood; he saw every thing wrong; he was crazed.

"I will not have this man stepping between me and my family," he hissed, sliding close to his wife and looking her fiercely in the eyes. "It has been going on now for a fortnight. It must be stopped. You shall not walk with him. Do you understand? I forbid it!"

"George, are you jealous of Mr. Grayson?" she whispered, in amazement and indignation. "George, you are absurd—and contemptible. I will not speak to you again until you apologize to me for this."

She turned her back on him and walked toward the cabin stairs. At that moment Grayson reappeared: "Ah! Mrs. Gordon," he lisped, proffering his arm; "allow me to conduct you below."

Hattie hesitated; it was a decisive moment; should she defy her husband? She took the old dandy's lean elbow, and let him conduct her below.

When Grayson returned to the deck he was in his cheerfulest mood, outsmiling the moon. This venerable Brummel, this simple, effete, vain, whimsical creature, this humorist without being aware of it, had spent his whole life in courtships, and considered them the only pursuit worthy of a high-toned gentleman, excepting, of course, politics and war. He had courted all classes of women, from the daughters of Presidents to the daughters of barbers. There never was a more miscellaneous and interminable adorer. It was all vanity; he was as harmless as a kitten; what he wanted was the name of the thing. Tell him that he had made an impression, and his shallow heart was full, it could not hold a drop more. That was the extent of his passions: just the name of the thing—just vanity.

Jokers used to say to him: "Syd, if you could traverse the empyrean you would delude the daughter of the man in the moon;" and Grayson, grateful for the compliment, would bow, simper, and chuckle, as if he were quite capable of the heaven-scaling audacity. If a woman looked twice at his singularly thin nose he rose on his heels, glanced at a comrade, and whispered, "That girl throws herself at a fellow's head." In consequence of watching for advances from the other sex his eye had acquired a furtive, sly expression, which made strangers take him for a black-leg. When he set sail for Greece he brought a flute and a guitar, with the idea of serenading some "maid of Athens." It was a common remark, and with many persons a serious belief, that "Beau Grayson was crazy about women."

This amorous old shadow—to whom long intercourse with good society had given a certain fund of information and a certain fluency of small talk which made him not quite intolerable—had commenced his attentions to Hattie Gordon a few weeks before leaving Virginia. He was very useful in dealing with conductors and book-vendors on the way to New York; he had been gallant to the Gordon trunks and hat-boxes during the embarkation; then he had

vanished in an agony of sea-sickness. After a time he had reappeared on deck, his once ebony whiskers blotched with gray, but his heart as young as ever. The girl bore his courtesies patiently. If not interesting, he was amusing; she could at least laugh at him. And we may judge, from what we have seen of her husband and mother-in-law, that they were not of a character to keep her in high spirits.

So there had been a sort of intimacy between Hattie and Syd Grayson. He had helped her bear the dullness of the voyage and the partial seclusion which was forced upon her by Mrs. Gordon senior. She had not remonstrated with him when he fluted to her at midnight, and she had encouraged him in gay mischief to make a spectacle of himself on deck with his guitar. For these innocent levities bitter witness had been borne against her by a mother-in-law who could not see a joke, who took every thing in life for earnest, and who tried her at the bar of hate—the irrational, pitiless hate of jealousy. We are even obliged to add that Mrs. Gordon was glad to believe Hattie blameworthy. She wanted her wrong; longed to destroy all her credit with George; desired a strong and cruel accusation against her.

Something of this Grayson saw; for, though naturally simple, he had learned to be cunning. The revelation that he was disturbing the peace of the Gordon household delighted his vanity. He lent himself readily to the intent of the infatuated mother-in-law, and tried his slender utmost to sport the air of a courtly, victorious Lothario. Now, as he returned to the deck after escorting Hattie into the cabin, he was in high glee because he had overheard her whisper to her husband, "George, are you jealous of Mr. Grayson?" Conceited, simple, effete mischief-maker, he was quite sufficient to work out the destiny which the elder Mrs. Gordon had prepared for her family.

Just at that moment the sickly, fragile, sensitive nature of the young husband was crazed with rage. He had ordered his wife not to walk with this man, and immediately on that she had defied him—had taken the forbidden arm. Scarcely knowing what he was about, George seized Grayson by the elbow, led him abaft the house on deck, out of sight of the helmsman, and, with a sudden movement, pulled his nose. It was a piece of ungentlemanly ruffianism only to be palliated on the score of Gordon's deranged constitution and shattered nerves, so plainly indicated by his extreme meagreness and sallowness, and the unhealthy brilliancy of his eyes.

"Mr. Gordon—let go," were Grayson's first words. As soon as he was free he added: "This is most outrageous conduct." A moment later he said, with one of his habitual and mechanical bows: "You are no gentleman, Sir."

These phrases, so simple and childish, and uttered in Grayson's effeminate lisp, excited George to a burst of lunatic laughter.

"I shall call you to account for this," continued the insulted man. "I presume you will accord me the satisfaction of a gentleman."

"Yes," replied George, turning to fury again, and advancing with set teeth and clenched fists.

"As soon as we get on shore, Sir," said Grayson, falling back a pace.

"Here and now!" was the little less than maniacal answer.

Knowing Gordon's character, we must absolve him from the degrading suspicion that he had proffered his insult on the assumption that Grayson was a coward and would not dare demand a bloody account. Had he acted thus he would have been punished not altogether unjustly by what followed; for the old dandy, it seems, was not overmuch afraid of wounds and death. Physically timid he was; even when his nose was being pulled he made no effort to fight; he simply scuffled to get away. But now that it was a question of blood, and of blood as soon as possible, he did not blench.

"Mr. Gordon," he minced, after an instant's thought, "it will have to be a rencontre."

"Certainly."

"There are no seconds to be had," continued Grayson. "I haven't the least idea that the captain and mate could be induced to act."

George made no answer; he was already sombre, not so much because of the future as of the past; he had degraded himself by his violence, and he was ashamed of it. But the feeling which drives the inexperienced duelist onward—the feeling that an apology would argue cowardice—kept him silent.

"If you will allow me a few moments for reflection, Mr. Gordon," added Grayson, with one of his ungovernable slight bows, "I think I can find a way out of our embarrassment."

"You are very obliging," said the young man, with unintentional irony. "I shall be happy to hear your proposition."

The wind was light and steady and the vessel sailing on an even keel, so that Grayson could take his usual finical steps as he walked the deck, meditating on what must be done and what might result from it. He did not like the prospect; wished he had let Mrs. Gordon alone: of course it was about Mrs. Gordon. At the same time he felt fiercely aggrieved: Gordon had pulled his nose—pulled it violently. What had he done to have his nose pulled? It was outrageous conduct, as he had said; and Gordon had been no gentleman, as he had also said; and, in short, Gordon deserved to be shot for it.

But then Gordon would shoot back; and here Mr. Grayson stopped short and looked hard at the ocean; it was disagreeable to think of being pitched into that chilling expanse of waters; he felt that he would far rather be buried in Virginia. The ocean might do very well for certain classes, say for sea-faring men and poor European immigrants. But it was decidedly not a fitting grave for a high-toned gentleman of the Old Dominion, who had his family vault dusty with revered forefathers. In fact, to

take in the whole thing, it was not desirable to be buried at all—that is, just at present.

But this was weakness: honor called him to face death; and what Grayson was ever deaf to honor? Yes, he had a family, a line of ancestors, an ancestral mansion—sold lately—and family plantations—sold long ago. All this commanded him, and in no small degree helped him, to fight when his nose was pulled. Shoot and be shot at he must; couldn't face Virginia again without it; couldn't go on calling himself a gentleman; couldn't talk of the Grayson blood. Finally he was very angry—to his astonishment seriously and even furiously angry—the honestest emotion that he had felt for years. It certainly was exasperating in the highest degree to have one's nose pulled, especially for the first time. "Such a thing never happened before in the whole course of my existence," thought Grayson with tremulous wrath.

Still he was trifling. He must think, and think he actually did, although thinking was not his forte. In a few minutes, suave, mincing, smiling, and lisping as usual, he returned to his enemy and said: "I believe I have it, Mr. Gordon. It is now eleven o'clock and about five minutes. At twelve o'clock it will strike eight bells. We can take our stand opposite each other, one on either side of the deck, a minute or so before twelve. After the first stroke of the bell the firing may commence; at the eighth stroke it will cease. I hope, Sir, that the idea meets your approbation. If not, I shall be happy to listen to your wiser suggestions."

"I see no other, at least no better way, Mr. Grayson," replied Gordon. "I agree to your conditions. But how many shots?"

"If you leave it to me," answered Grayson, with a natural shudder, "I venture to propose two for each. At all events, I shall be satisfied with that number."

"I do leave it to you," said George. "Let it be two each."

"Then, Sir, with your permission, I will attend to my preparations."

"Certainly," sighed George. "By-the-way—excuse me," he called as the other was departing. "It might be well for each of us to leave a note, stating the circumstances of the rencontre, so that the survivor may not be held a murderer."

"A very admirable suggestion," bowed Grayson. "I shall unquestionably put it in practice."

After twenty minutes of moody waiting Gordon went below and found the little cabin of the bark deserted, the ladies having long since retired, and Grayson being in his state-room. By the light of a feeble lamp which swung over the table the young man wrote the explanatory note of which there had been question, directed it to the captain of the *Osmanli*, and put it in his breast-pocket. Then he meditated upon another note to his wife; not an angry one—oh

no, nothing but tenderness now—not even the reproach of forgiveness. It was a long and awful task, but it was accomplished.

"MY DARLING,—I have had a quarrel with Mr. Grayson. It does not concern you, and you must not hold yourself responsible for it. Pardon my last words to you, and do not break your heart for me.

"Your loving husband,

"GEORGE G. GORDON."

Having put this also into his pocket he stole to his state-room and looked at his wife. She was asleep; but her pillow where it touched her face was wet as if with tears. He must not wake her; he would not venture to kiss her hand—just looked at her and passed out.

Another parting, not so harrowing as this, but still very painful, was from his beloved sphere of labor, his professorship. "I must give up being an honor to my college," he thought, with a sorrow like that of Buckle on his death-bed, when he moaned, "My book! I shall never finish my book."

Pausing in the cabin to examine his revolver he received a shock from what may without exaggeration be styled the terrible courtesy of Grayson. That gentleman appeared; he, too, had his revolver in hand; he bowed and tendered the stock of it.

"We have no seconds to see that every thing is regular," he whispered. "Yet I am exceedingly anxious to have you know that I am taking no advantage of you. There are but two charges in this. Would you like to examine?"

Gordon gently waved the weapon aside, with the words, "I rely entirely upon your honor."

Grayson was not to be excelled: "You are very polite," he said, with a Chesterfieldian smile and bow; then calling up all his courtesy, "but not more polite than I expected to find you."

When the two men reached the deck in company it lacked but five minutes of twelve. Placing themselves opposite each other in the waist of the vessel, each with his back against one of the shrouds of the main-mast, the head and bust showing against the clare-obscure of sea and sky, they awaited the signal of death.

What does a man think of when he stands consciously on the borders of the grave? The writer of this knows by frequent experience that there is in such conditions very little consecutive thought. The mind acts in brief and numerous, yet not violent coruscations, which seem almost to explode at once, and which incessantly extinguish each other. The peril—the distant home—again the peril—what is beyond—the movement of some object—the outline of another—the dread of bodily pain—the chances of escape—what happened yesterday—what should be done to-morrow—hopes that may be dashed—once more the loved ones—then again the peril—always a foreboding—a dull, persistent foreboding. Such is the waiting for conflict; a very different thing from conflict actual—a thing much harder to bear.

As the fated moment approached the trial

became lighter, for the mind sprang to action. Each glanced at his adversary, then at the man at the helm, again at the antagonist, again at the helmsman. Gordon, who had taken the larboard side of the vessel, was fortunately left-handed, so that he could face properly for an aim without losing sight of the silent figure which was to give the signal.

At last the mate, who was slowly pacing the quarter-deck, was heard to utter two monosyllables. The helmsman reached out his hand; the pistols were grasped convulsively; a clear, short crash penetrated the air; the weapons rose simultaneously to a level; another brazen note and then a burst of fire-arms.

That eight bells was not finished. At the explosion of the pistols the sailor started from the helm and then swung quickly back to it, but did not again touch the bell. The mate, with an oath of astonishment, ran forward to the waist and reached the body of George Gordon just as Grayson attempted to lift it by the limp arms. The stricken man had no doubt died instantaneously, for he had fallen at full length on his face and thenceforward had not stirred, not even in convulsion. Before a word had been uttered by any one the captain was on deck and with the group.

"What does this mean?" he exclaimed, bewildered and horror-stricken.

"Captain, it is a duel," said Grayson, in a shuddering whisper. "Really, Captain, this is horrible. I had no idea. You must explain to the ladies. A duel between Mr. Gordon and myself. I shall jump overboard."

In the first agony of his remorse he would have thrown himself into the sea, had not a sailor dragged him from the bulwarks, and adroitly passed the end of a halyard around his waist.

"Shut the cabin-door," ordered the captain; "don't let any one on deck." Then, turning to Grayson, "You are a murderer!"

"Never, Sir," lisped Grayson, drawing himself up; "I am a man of honor. Here is that gentleman's bullet-hole through my hat. In his breast-pocket you will find a note which will explain this tragedy."

The paper was found and read. "Still, I shall have to surrender you to the American Consul at Smyrna," declared the captain.

"I am perfectly willing. But consider, Sir, that it will be horrible cruelty to those ladies to keep me on board with them. Could you not do them and me the favor to transfer me to some other vessel?"

"There is a craft abeam," suggested the mate. "She looks like the *Stamboul*, and of course the *Stamboul* is bound for Smyrna, if it is the *Stamboul*."

The hint was taken. In a few minutes the course of the bark was changed; in an hour Grayson was on board the *Stamboul*. Shortly afterward the Gordon ladies were awakened from the heavy slumber of sea-farers, and bid-

den, with such gentleness as sailors could show, to look upon the corpse of their husband and son.

It was a horrible scene. But of all its doleful circumstances the most shocking was the word which the mother launched at the wife.

"That," said she, pointing to the dead body with the air of an avenging fury—"that is your work." She could not see that it was her own.

We must pass onward eighteen months in order to obtain the sober second thought of Sydney Grayson concerning the tragedy and its bearings.

"It was a most lamentable affair," he admitted to a friend who dined with him in Paris. "I of course felt bound to make all possible amends to the widow. I took the liberty of writing to her," he lisped, with one of his little bows; "I wrote to her, and offered my hand. She never replied—never even replied to me, Sir—not a word, Sir! That ends, as I imagine, my responsibilities. What more can a gentleman do?"

GIANTS AND DWARFS.

The Giants of Scripture.—Height of Adam, Eve, Noah, Abraham, Moses.—Early British Giants.—Statues at Carnac, Thebes, Luxor, Athens.—Big Men of Crete.—The Great Emperor, Maximus.—A 400-foot Person.—Giant of Scio, whose skull held 210 pounds of corn.—A 25-foot Frenchman.—Some big Englishmen.—Cotton Mather on the tall fellow at Albany.—The Giants of Rabelais, Bunyan, and Swift.—Jack the Giant-killer.—Cannibal Giants.—Blunderbuss and Tom.—The Greatest Straddler on record.—Doctoring a Giant.—Homes of Giants.—Mummies.—Patagonian People.—Earl of Warwick, his Pot and Fork.—Long Meg.—A big Girl.—Walter Parsons, a sportive Giant.—Mass Meeting of Giants and Dwarfs in Vienna.—Big Men and Little ones.—Pepys's great Dutchman, and his Wife.—A Saxon man of might.—King of Prussia's Regiment of Giants.—A brief Poland.—Big O'Brien.—Charles Lamb's "Gentle Giantess."—Tall Toller.—John McPherson.—James Freeman, Yankee Giant, Bar keeper, and Poet.—Pigmies.—Short Men in Scripture.—The Original Tom Thumb.—Mandeville's Pigmies.—Pigmies of Asia and Africa.—Isle of Pigmies.—Dwarfs of Tennessee.—Of Madagascar.—The Kinios.—Household Dwarfs of the old Emperors.—The Prodigal Son and Dwarf.—A "Sell."—Russian Dwarfs.—Byron on Little People.—Sir Jeffrey Hudson.—Christopher Wren.—Isaac Newton.—Great Wedding Festival of Dwarfs in Russia.—John Coan, Dwarf and Poet.—A Courtly Dwarf.—Count Borulawski, the accomplished Dwarf.—Long-lived Dwarfs.—Charles Lamb and Captain Starkey.—Thumb and Nutt.

THE foregoing table of contents will sufficiently indicate to the reader the character of the history he is about to peruse. It may, or may not, be taken *cum grano salis*. When very great people are described, whether men of brawn or men of brain, a liberal faith may not unprofitably be exercised. When little people are brought upon the carpet a little confidence will not come amiss. Giants are nothing if not very tall; dwarfs nothing unless very short. From the days of Adam down to the days of Grant and Seymour, there have been giants. We first read of them in Genesis, vi. 4: "There were giants in the earth in those days; and also after that, when the sons of God came in unto the daughters of men, and they bare children to them, the same became mighty men which were of old, men of renown." After these were the Rephaim, who were defeated by Chedorlaomer. After them the Emims, alluded to in the second chapter of Deuteronomy, and the Anakims, and the Zamzummims; all of whom in time disappeared, leaving only Og, the King of Bashan, a rather lengthy monarch, "whose bedstead was a bedstead of iron; nine cubits was the length thereof, and four cubits the breadth of it, after the cubit of a man."

The cubit of a man is the space from the tip of the finger to the elbow, that is, half a yard; therefore Og's bedstead was $13\frac{1}{2}$ feet long. Reckoning the size of men to their bedsteads, Og was probably about 9 feet high. He has furnished material for many Eastern legends, in one of which he is said to have escaped the Flood by wading only knee-deep beside the ark, and to have lived 3000 years. One of his bones is reputed to have long served for a bridge over a river; and he is credited with having "roasted at the sun a freshly-caught fish." Goliath, the famous Gath man, who had a difficulty with David, was in height "six cubits and a span," which would make him 9 feet 9 inches high. His coat of mail weighed 5000 shekels of brass, which is about 208 pounds, and his spear, "like a weaver's beam," about 25 pounds.

In 1718 a French academician named Henrion endeavored to show a great decrease in the height of men between the periods of the Creation and the Christian Era. Adam, he says, was 123 feet 9 inches high; Eve, 118 feet 9 inches; Noah, 27 feet; Abraham, 20 feet; Moses, 13 feet. The allegation about Adam is moderate compared with that made by early Rabbinical writers, who affirm that his head overtopped the atmosphere, and that he touched the Arctic Pole with one hand and the Antarctic with the other. Traditionary memorials of the primeval giants still exist in Palestine in the form of graves of enormous dimensions; as the grave of Abel near Damascus, which is 30 feet long; that of Seth about the same size; and that of Noah, in Lebanon, which is 70 yards in length!

The monkish historians promulgated the idea that the earliest possessors of Great Britain were men of immense stature. John de Warin, in the "Chronicles of Great Britain," written in 1445, relates that in the time of Jahir, the third Judge of Israel after Joshua, Lady Albine and her sisters came to and settled in an island which they named Albion after her, afterward called Britain. While they were living there the devil assumed the shape of a man, and dwelt among the wicked women, and by them had issue great and terrible, giants and giantesses, who occupied the land until Brutus came and conquered them. At the time of his visit there were two giants more wonderful than all the rest, Gogmagog and Lancorigan. It is the former, it is said, whom Milton had in mind when he wrote:

"His spear—to equal which the tallest pine
Hewn on Norwegian hills, to be the mast
Of some great amiral, was but a wand."

The ancient people of most countries seem to have possessed in the strongest degree a faith in giantology, as evidenced by the vast images of their gods and their colossal monuments of architecture. In front of the portals of the palace of Carnac, in Egypt, are gigantic human statues; and in one of the courts are twelve immense stone figures 52 feet high,

which impress upon the beholder that he is entering a home of departed giants. The adjacent palace of Luxor has two granite statues, each 38 feet high, at the entrance. In the ruins near Thebes are three huge figures, now thrown down, one being 64 feet long. In the Parthenon of Athens, many years before Christ, was a statue of Minerva 36 feet high. The temple of Jupiter at Olympia, before Christ, contained a seated statue of a god which rose almost to the ceiling of the building, and that was 68 feet high.

Pliny says that by an earthquake in Crete a mountain was opened, and in it was discovered a skeleton standing upright, 46 cubits long, which was supposed to be that of Orion or Otus. The same author relates that in the time of Claudius Cæsar there was a man, named Gabbaras, brought by that Emperor from Arabia to Rome, who was 9 feet 4 inches high, "the tallest man that has been seen in our times." But this giant was not so tall as Posio and Secundilla, in the reign of Augustus Cæsar, whose bodies were preserved as curiosities in a museum in the Sallustian Gardens, and each of whom measured in length 10 feet 3 inches.

During the Cretan war there was discovered a body of prodigious size. The rivers rose to an unusual height, and when the floods were gone, in a great cleft of the earth there was found the carcass of a man of the length of 33 cubits, or near 42 feet. Lucius Flaccus, the then legate, allured with the novelty of the report, went with a party of friends to the place to take a view of it; and they there saw what upon hearsay they had imagined to be a fable.

The Emperor Maximus (very much of a man) was 9 feet high, and was in the habit of using his wife's bracelet for a thumb-ring. His shoe was a foot longer than that of any other man, and his strength so great that he could draw a carriage which two oxen could not move. He generally ate forty pounds' weight of flesh and drank six gallons of wine every day. Not at all a desirable or profitable guest for the "St. Nicholas," even at the current price of board; though not so tall as one of whom Josephus tells, viz.: Eleazar, a Jew, who was one of the hostages whom the King of Persia sent to Rome after a peace. This giant was over 10 feet high. But these are pigmies compared with him of whom Kircher writes (though this is what a Yankee philosopher would denominate a whopper!). The skeleton of this giant was dug out of a stone sepulchre near Rome in the reign of the Emperor Henry II., and which, by an inscription attached to it, was known to be that of Pallas, who was slain by Turnus, and was higher than the walls of the city! The same author tells us that another skeleton was found near Palermo that must have belonged to a man 400 feet high; and who, therefore, could have been no other than one of the Cyclops, most probably Polyphemus himself, who might

"Easily have overstepped
Goliath's helmed head, or that huge King
Of Basan, hugest of the Anakim."

To come down one or two hundred feet. Father Jerome de Monceaux writes of the skeleton of a giant 96 feet long, found in a wall in Macedonia. This fact was communicated to him by Father Jerome de Rhetel, a missionary in the Levant, who, in a letter written from Scio, stated that this giant's skull was found entire, and could contain 210 pounds of corn; that a tooth of the under-jaw weighed fifteen pounds, and was seven inches two lines in length! There *was* a man! Was there a Barnum then extant?

In times more modern (1613), some masons digging near the ruins of a castle in Dauphine, in a field which by tradition had long been called "The Giant's Field," at the depth of 18 feet discovered a brick tomb 30 feet long, 12 feet wide, and 8 feet high, on which was a gray stone with the words "Theutobochus Rex" cut thereon. When the tomb was opened they found a human skeleton entire, 25½ feet long, 10 feet wide across the shoulders, and 5 feet deep from the breast to the back. His teeth were about the size of an ox's foot, and his shin-bone measured 4 feet in length.

Plot, in his "Oxfordshire," 1676, says that a skeleton 17 feet high was then to be seen in the town-hall in Lucerne. It had been found under an old oak in Willisau, near the village of Reyden. He instances numerous gigantic bones which had been dug up in England, and adds: "It remains that (notwithstanding their extravagant magnitude) they must have been the bones of men or women; nor does any thing hinder but they may have been so, provided it be clearly made out that there have been men and women of proportionable stature in all ages of the world, down even to our own days."

Old Cotton Mather held the belief that there had been in the antediluvian world men of very prodigious stature, in consequence of the finding of bones and teeth of great size, which he judged to be human, in Albany. He describes one particular grinder weighing 4½ pounds, and a broad, flat, fore-tooth four fingers in breadth; also a bone, supposed to be a thigh-bone, 17 feet long, which, with the others, crumbled to pieces as soon as it was exposed to the air.

Giants have always been great favorites with fiction-writers, and they live in the folk-lore of every country. Some of the most popular works in modern literature have had for their heroes these fabulous creations. Spenser, in his "Faery Queene," tells us of

"An hideous giant, horrible and hie,
That with his talnesse seem'd to threat the skie."

Rabelais invented Gargantua. Bunyan found the Giant Despair very useful in his story. Gulliver would not be Gulliver without the giants and dwarfs. And the world of romance would be dull without Blunderbuss, Cormoran, King Arthur, Fingal, and such.

The story of Jack the Giant-Killer has probably been mentioned in the hearing of the reader. That story was printed certainly as early as 1711, if not before, and of its hero Hannah More, in "An Heroic Epistle," written on the blank leaves of "Mother Bunch's Tales," says:

"Then leave your Robertsons and Bryants
For Jack the murderer of giants,
Since all mythology profane
Is quite as doubtful, quite as vain."

Now and then we come across a legend not so pleasing, as in the case of a Cornish giant named Haliburn of the Cairn. Once when watching some Cornishmen hurling, he was so pleased at the game made by a young peasant that, in mere good-nature, he killed him by patting him on the head. The giant of Trebiggan is said to have dined every day on hot child, preferring them fried, and performing the culinary manœuvre on a flat rock outside his cave. His arms were so long that he would snatch the sailors from ships passing by the Land's End; and sometimes, after having had his fun, replace them again. Thus he combined the blood-thirsty with the jocular!

More melodramatic and sensational is the history of Tom and the giant Blunderbuss. Tom, according to history, was a lazy young giant, living near Hoyle, and his unwieldy rival resided in a castle near St. Ives. Tom, in driving a wagon full of beer from market, trespassed on the territory of the giant, who attacked him with his club—a young elm-tree. Tom fought him with a wheel and an axle-tree, and eventually run him through the body with the pole! As a reward for his fair fighting and courage the giant left Tom all the gold, copper, and tin in his castle. Which was generous.

But, are not the women to be mentioned? Is Delilah the only lady of whom honorable mention is to be made as a squelcher of giants? Not so, i' faith! The giant Bolster lived on St. Agnes Beacon Hill, and the earth-work near Porth still bears his name. He could stand with one foot (this straddler) on St. Agnes Beacon, and the other on Carn Brea Hills, six miles apart. He fell in love with St. Agnes, who, weary of his importunities, offered to marry him if he would fill a hole in the cliff at Chapel Porth with his blood; but as the hole opened into the sea, unknown to the giant, he fell a victim to his love. The red stain still visible in the cliff shows where the deluge of blood once poured.

The Faculty may possibly be interested to know of a little exploit performed, without pill or instrument, on a huge giant named Goran, who in one night dug an intrenchment 20 feet broad and 24 feet high. Being ill, he called in a subtle doctor; but he grew so weak at last that the medical man kicked him over the cliff and killed him.

Villmere remarks that human height becomes greater, and the growth takes place more rapidly, other circumstances being equal,

in proportion as the country is richer, the comfort more general, houses, clothes, and nourishment better, labor, fatigue, and privation during infancy and youth less. Virey, in the "Dictionnaire des Sciences Medicales," points to the fact that intense cold and dry heat tend alike to dwarf the population; a moist, temperate climate being better than either. Men living by the sea-coast and in level countries are larger in their stature than the inhabitants of mountainous regions. This theory, however, would not hold in the United States, where statistics show that the tallest and most perfectly developed men are "raised" in Kentucky.

Silbermann, a French writer of the day, concludes that the average height of the human race has remained unchanged since the Chaldean epoch, four thousand years ago. The mummies brought from Egypt, which are at least three thousand years old, are no larger than people of our day. It is plain from the notices which historians have given of giants that they were always rarities, or strange organic mistakes of nature; and we have no reliable accounts of a race of giants ever having existed. It was long thought that the Patagonians were men of enormous stature, and the assertions of the old voyagers on the point were positive. Wallis, Carteret, Cooke, Forster, Sir Thomas Cavendish, and other voyagers, speak of them as of huge proportions; but Buffon, Sir Hans Sloane, and others in the last century disputed the fact, and a lively discussion grew out of it. Captain Bourne, who resided among them about the year 1849, says: "In person they are large; taller than any other race I have seen. The only standard of measurement I had was my own height, which is about 5 feet 10 inches. I could stand very easily under the arms of many of them, and all the men were at least a head taller than myself; their average height I should think is nearly 6½ feet. They have broad shoulders, full chests, fine frames, well-proportioned, and exhibit enormous strength when aroused; teeth fine, countenances stupid. The women are proportionably smaller than the men, and rather inclined to *embonpoint*."

In the reign of Athelstan (940) existed that wonderful person, Guy, Earl of Warwick, and at Warwick Castle are preserved some so-called relics of the man. They consist of his porridge-pot, flesh-fork, breast-plates, shield, sword, etc. The porridge-pot is composed of bell-metal, and is said to weigh three hundred pounds, and to contain one hundred and twenty gallons. It does not appear that this brazen vessel has always been known as the giant hero's porridge-pot, for in former times it was called Talbot's pot. An old couplet says:

"There's nothing left of Talbot's name
But Talbot's pot and Talbot's Lane."

But the men are not the only ones famous in giantology. In the reign of Henry VIII. "was borne of very honest and worthy parents a maid called for her excesse in height Long Meg; for

she did not only passe all the rest of her country in the length of her proportion, but every limbe was so fit to her talnesse that she seemed the picture and shape of some tall man cast in a woman mould." So says a curious pamphlet or chap-book published in 1635, entitled, "The Life of Long Meg of Westminster; containing the mad merry pranks she played in her lifetime, not onely in performing sundry quarrels with divers ruffians about London; but also how valiantly she behaved her selfe in the warres of Bolloinge."

In this work is told how Meg came up to the country from London, beat a carrier on the way, used up a vicar and a bailiff of Westminster, merrily skirmished with a Spanish knight, fought with thieves, beat the French at Boulogne, got married, played mad pranks with a waterman of Lambeth, and did other strange exploits with hoydenish prowess. She is also alluded to by Ben Jonson, who makes one of his characters in the masque of the "Fortunate Isles" say:

"Or Westminster Meg,
With her long leg,
As long as a crane;
And feet like a plane,
With a pair of heels
As broad as two wheels,"

which is any thing but flattering to the lower limbs of a lady.

Another huge girl is described by Platerus, a physician of the seventeenth century, who saw her in Basle. At five years of age her body was as large as that of a full-grown woman. Her thighs were thicker than his horse's neck, and the calf of her leg was equal in size to the thigh of a lusty man. The girdle that she wore about her waist would go round her father and mother standing together. Before she was a year old she weighed as much as a sack of wheat that held eight bushels. She died in childhood.

One of the most celebrated of England's giants was Walter Parsons, the porter to James I. His height was 7 feet 7 inches, and he was well proportioned. He was an amiable giant, and quite inclined to be sportive, as when "being affronted by a man of ordinary stature, as he walkt London streets, he only took him up by the waistband of his breeches, and hung him upon one of the hooks in the shambles, to be ridiculed by the people, and so went his way; and that sometimes, by way of merriment, he would take two of the tallest yeomen of the Guard (like the gizard and liver) under his arms, and carry them as he pleased (in spight of all resistance) about the guard-chamber; where that is his picture which hangs next the stairs, leading down into the Court toward White Hall gate."

Guy Patin, a celebrated French surgeon, relates that in the seventeenth century, in order to gratify a whim of the Empress of Austria, all the giants and dwarfs in the Germanic empire were assembled at Vienna. As circumstances

required that all should be housed in one extensive building, it was feared lest the imposing proportions of the giants should terrify the dwarfs, and means were taken to assure the latter of their perfect safety. But, in confirmation of the proverb "A dwarf threatens Hercules," the result was very different to that contemplated. The dwarfs teased, insulted, and even robbed the giants to such an extent that the overgrown mortals, with tears in their eyes, complained of their stunted persecutors; and, as a consequence, sentinels had to be placed in the building to protect the giants from the dwarfs. This story illustrates the fact that giants are almost always characterized by mental and bodily weakness, while dwarfs are generally active, intelligent, healthy. Virey says that "tall men are generally much more weak and slow than short men, for all exertions, both of body and mind. Tall men are mostly tame and insipid, like watery vegetables. Tall men seldom become very great men. Little men manifest a character more firm and decided than those lofty and soft-bodied people. Therefore the proverbial expression "Long and lazy, little and loud" may be true for physical reasons.

We once heard it remarked by Mr. Kennedy, Superintendent of the Metropolitan Police, that the most efficient men of the force were "short, wiry fellows," capable of undergoing great fatigue, and more to be relied upon in a "tight place" than the very tall or the very heavy fellows.

Pepys, on August 16, 1664, was "at Charing Cross, and there saw the great Dutchman that is come over, under whose arm I went with my hat on. He is a comely and well-made man, and his wife is a very little, but pretty comely Dutch woman. The illustrated hand-bill announcing the exhibition of this man reads:

"The true effigies of the German giant, now to be seen at the Swan, near Charing Cross, whose stature is 9½ feet in height, and the span of his hand a cubit compleat. He goes from place to place with his wife, who is but of ordinary stature, and takes money for the shew of her husband."

In the British Museum is preserved a hand-bill, of the date of 1732, of which the following is a copy:

"G. R. This is to give notice to all gentlemen, ladies, and others. That there is just arrived from France, and is to be seen at the Fan, over against Devereaux-court, without Temple Bar, a giant, born in Saxony, almost 8 foot in height, and every way proportionable; the like has not been seen in any part of the world for many years. He has had the honour to shew himself to most princes in Europe, particularly to his late majesty the King of France, who presented him with a noble scymitar and a silver mace. N.B. He is to be seen ten in the morning till eight at night, without any loss of time, his stay in this place being but short, he designing to go for Holland."

Hogarth, in his print of Southwark Fair, introduces the figure of this man on a show-cloth.

Dr. J. R. Foster, in his "Observations on a Voyage Round the World," makes some remarks about the propagation of giants, based upon the following facts: The King of Prussia

had a corps of gigantic guards consisting of the tallest men who could be drawn together from all quarters.

"They were mostly nervous, six-foot fellows, All fit to make a Patagonian jealous."

A regiment of them was stationed during fifty years at Potsdam; and, says Foster, "a great number of the present inhabitants of that place are of very high stature, which is more especially striking in the numerous gigantic figures of women. This certainly is owing to the connections and intermarriages of those tall men with the females of that town."

The taste for a regiment of tall men extended to Russia; for Byron, in his "Don Juan," says:

"This fellow, being six foot high, could raise
A kind of phantasy proportionate
In the then sovereign of the Russian people,
Who measured men as you would do a steeple."

The following announcement, copied from the London *Daily Advertiser*, of June 3, 1845, is quite up to any thing of the kind that has emanated from the pen of Mr. Barnum:

"Whatever is in itself good will always make its way, although not ushered into the world with pompous paragraphs or pageant-like puffs. As an example of this truth the undertakers of the New Wells, near the London Spaw, beg leave to assure the town, since thronging audiences have been pleased to encourage their endeavors, they intend to double their pains, and hope for a continuance of favor. The god of wine and deity of wit have long gone hand in hand, and to keep them both alive the best way is to blend them; therefore, for the reception of the curious, they have provided the best of both their productions: and, as varieties in nature are as pleasing as those of art, the greatest that can now be shown is every evening to be seen at the Wells, viz., a young Colossus, who, though not sixteen, is 7 feet 4 inches high, has drawn more company this season than was ever known before, and must convince the world that the ancient race of Britons is not extinct, but that we may yet hope to see a race of giant-like heroes."

At the same New Wells, in the following season there was introduced

"The wonderful little Polander, only 2 feet 10 inches high, sixty years old, and in every way proportionable, and wears his beard after his own country's fashion. Also the tall Saxon woman, 7 feet high, between whom and the Lilliputian Polander there is to be a country dance."

A newspaper of October 19, 1786, in speaking of the famous Irish giant, O'Brien, says:

"This man, who last winter exhibited his person in St. James's Street, was lately married at Pancras Church to a young woman of the name of Cave, who may now, for more reasons than one, without impropriety, be termed the Giant's Cave."

O'Brien used to announce that the family height was nine feet, which size he hoped to attain by the time he became of age. On one night, having occasion to visit a friend, O'Brien entered a hackney-coach; the coachman did not see him go in, but on seeing him go out stood amazed. Having met a brother of the whip a few minutes after he exclaimed, "— me, but I have done more than you all, for I have just carried the Monument." Another anecdote of the man is told by Dr. Robert Bigsley, who says that his late father, at a Ma-

sonic banquet held in a lodge in Nottingham, in 1792, saw O'Brien draw from his coat-pocket a dwarf, who was, as the doctor believes, Count Borulawski.

Charles Lamb wrote a pleasant paper upon "the Gentle Giantess." He says:

"The Widow Blacket, of Oxford, is the largest female I ever had the pleasure of beholding. There may be her parallel upon the earth; but surely I never saw it. I take her to be lineally descended from the maid's aunt of Brentford who caused Master Ford such uneasiness. I have passed many an agreeable holiday with her in her favorite park at Woodstock. With more than man's bulk, her humors and occupations are eminently feminine. She sighs—being six feet high. She languisheth—being two feet wide. She worketh slender sprigs upon the delicate muslin—her fingers being capable of moulding a Colossus. She sippeth her wine out of her glass daintily—her capacity being that of a tun of Heidelberg. She goeth mincingly with those feet of hers, whose solidity need not fear the black ox's pressure."

One of the most celebrated of Britain's tall folk was James Toller, born in 1795, who at the time of his death, in 1819, had gained the height of 8 feet 6 inches. He had two sisters, both of gigantic growth; one at the age of thirteen was 5 feet 8½ inches high; the other, at the age of seven, was nearly 5 feet high. On his first exhibition in London a poet wrote:

"To see him hundreds day by day did throng,
As he from place to place did pass along;
His 'bode uncertain, for to think 'tis vain,
One place so tall a wonder to contain.
His whole proportion was upright and straight,
'Twas eight foot fully and a half in height;
Not much in debt to age, his body clean,
Up to his stature, and not fat, nor lean."

Most people have heard of the "eminent" Mr. M'Pherson, who was himself perforated at Waterloo after killing many cuirassiers. The legend says:

"John M'Pherson
Was a wonderful person;
He was six feet two
Without his shoe;
And he was slew
At Waterloo."

Some fifteen years ago a lengthy American named Freeman went over to London, and mingled liquors as bar-keeper, at the "Lion and Bull" public house, Holborn. He was 7 feet 6 inches high, and thus invited the public to visit him:

"You need not unto Hyde Park go,
For without imposition,
Smith's Bar Man is, and no mistake,
The true Great Exhibition.

"The proudest noble in the land,
Despite caprice and whim,
Though looking down on all the world
Must fain look up to him.

"His rest can never be disturbed
By chanticleer in song,
For though he early goes to bed
He sleeps so very long.

"Then come and see the Giant Youth,
Give Edward Smith a call,
Remember, in Red Lion Street,
The Lion and the Ball."

" Liquors of a Giant's STRENGTH."

We believe that it was Freeman who, being in Boston and walking down State Street, was stopped by a good old lady who asked: "Mister, were you large when you were small?" "Yes, marm," said Freeman, "I was considerable big when I was little."

Come we now to the Pigmies:

It is curious that the Bible, which contains so many allusions to giants, contains but one mention of a dwarf, and that is in Leviticus, xxi. 20, where it is commanded that no man who was a dwarf should make the offerings at the altar. This, however, is scarcely true, if taken in a jocular sense. The writer, in conversation with a Doctor of Divinity concerning brief people—it was at the time of Tom Thumb's nuptials—said *Ne-hi-miah* (Knee-high-miah) was shorter than Mr. Thumb, as was also Bildad, the *Shu-hite* (Shoe-height); but neither of the Old Testament little ones was as "short" as the one in the New Testament, who said: "Silver and gold have I none;" for the man who was *minus* both those commodities was probably as "short" a person as was ever known.

The first record we have of the assumption of the name of Tom Thumb, by a dwarf, was in 1597. In 1630 was printed a poem entitled "Tom Thumbe, his Life and Death," which says, of a later Thumb:

"In Arthur's court Tom Thumbe did live,
A man of mickle might,
The best of all the table round,
And eke a doughty knight:
His stature but an inch in height,
Or quarter of a span;
Then thinke you not this little knight
Was prov'd a valiant man."

Sir John Mandeville, who traveled in Asia and Africa between 1322 and 1356, tells us of a land of pigmies, where there were men only three spans long. Both men and women were fair and gentle, and were married when they were half a year old. They generally lived only six or seven years, and at eight were considered to be old. They were the best workmen of silk and cotton, and of all manner of other things that were in the world. They scorned great men as we do giants, and had them to travel for them and to till the land.

In a rare book by Laurens Andrewes, entitled "Noble Lyfe and Nature of Man," is the following curious description of pigmies:

"Pigmies be men & women, and but one cubite longe, dwellinge in the mountaines of Yude; they be full grown at their third yere, & at their seven yere they be olde; & they gader them in May a grete company togeder, & arme them in theyr best maner; and than go they to the water syde, & where-so-ever they fynd any cranes nestis, they breake all the egges, & kyll all the yonges that they fynde; and this they do because the cranes do them many displeasures, & fight with them often tymes, & do them great scathe; but these folke cover their houses with the cranes feders & egshels."

One of the Hebrides is called the "Isle of Pigmies," where it is reputed that several miniature bones of the human species have been

dug up in the ruins of a chapel there. William Collins, in his "Ode on the Popular Superstitions of the Highlands of Scotland," refers

"To that hoar pile which still its ruins shows;
In whose small vaults a pigmy folk is found,
Whose bones the delver with his spade upthrows,
And culls them, wondering, from the hallow'd
ground."

Tennessee newspapers, of the year 1828, stated that in that year several burying-grounds, from a half acre to an acre in extent, were discovered in Sparta, White County, Tennessee, wherein very small people had been deposited in tombs or coffins of stone. The greatest length of the skeletons was 19 inches. The bones were strong and well set, and the whole frames were well formed. The graves were about 2 feet deep. The dead were all buried with their heads to the east and in regular order, laid on their backs, and with their hands on their breasts. In the bend of the left arm was found a cruse or vessel that would hold nearly a pint, made of ground stone or shell of a gray color, in which was found two or three shells. One of these skeletons had about its neck ninety-four pearl beads. Webber, in his "Romance of Natural History," 1853, refers to the diminutive sarcophagi found in Kentucky and Tennessee, and he describes these receptacles to be about 3 feet in length by 18 inches deep, and constructed, bottom, sides, and top, of flat, unhewn stones.

In his account of a voyage to Madagascar, in 1770, Rochon says that he resided for some time among the Lilliputian race of that island. The common size of the men, by exact measurement, was 3 feet 5 inches; the women some inches shorter. They were possessed of much wit and intellect, and were the boldest and most active warriors on the island. The Kimos, on the same island, dwarfs, were lively, intelligent, and ingenious. The women had scarcely any breasts, except when they suckled. The author particularly describes a Kimos woman, a slave, belonging to the Governor of Fort Dauphin. She was about thirty years of age, and 3 feet 7 inches high. Her complexion was very fair, her limbs well formed, her arms exceedingly long, hair short and woolly, and features agreeable. She had no appearance of breasts except the nipples. She was good-humored, sensible, and obliging.

Dwarfs were a customary part of the suits of grand personages in the East from the earliest times. The Romans were very great admirers of them, and kept them, as we do monkeys, for diversion. Marcus Antonius is said to have kept a dwarf named Sisyphus, who was not two feet in height and yet had a lively wit.

"What perfection can not Nature crowd
Into a puny point!"

John Wierix's Bible, published in 1594, contains an engraving by that artist representing the feast of Dives, with Lazarus at his door. In the rich man's banqueting-room is "a dwarf

playing with a monkey and contributing to the amusement of the company." In the same book is another plate illustrating the parable of the prodigal son, who is depicted as running away from a woman who is beating him down the steps of a tavern with her shoes, and is assisted in the assault by two men. A dog upon the steps is barking at the flying spendthrift, and a dwarfish fool has dropped his bauble to mock him, which he does by placing the thumb of his left hand at the end of his nose, the tip of the little finger of the same hand on the top of his right thumb, and spreading out the fingers to the utmost extent. (We reckon our juvenile friends are familiar with the manœuvre.)

Porter, in his "Travels in Russia and Sweden," in 1805-1808, tells us that the practice of keeping dwarfs in the houses of the nobles much prevailed in the former country. In the presence of their lord their usual station is at his elbow, in the character of a page; and during his absence they are responsible for the cleanliness and combed locks of their companions of the canine species. The race of these unfortunates in Russia is quite numerous. They are generally well shaped, and their hands and feet particularly graceful. On the whole they are such compact and pretty little beings that no idea can be formed of them from the clumsy, deformed dwarfs which are exhibited in England.

Byron, in "Don Juan," gives many passages about the dwarfs who were kept for amusement and ornament in the East. In a scene laid in a Greek island, he says:

"Afar a dwarf buffoon stood telling tales
To a sedate gray circle of old smokers,
Of secret treasures found in hidden vales,
Of wonderful replies from Arab jokers,
Of charms to make good gold and cure bad ails,
Of rocks bewitch'd that open'd to the knockers,
Of magic ladies who, by one sole act,
Transform'd their lords to beasts (but that's a fact)."

Byron, however, was prejudiced in reference to diminutive ladies, for he says, with more force than politeness:

"Her stature tall—I hate a dumpy woman."

One of the most remarkable as well as most intellectual dwarfs of England was Jeffrey Hudson, born in Rutlandshire in 1619. The king bestowed knighthood on him in a frolic. Being so much favored by royalty he seems to have forgotten the humility of his birth. "Hee was high in mind, not knowing himself, and hee would not knowe his father, for which, by the king's command, he was soundly corrected." He remained at the height of 18 inches from the age of eight until the age of thirty years, after which period he increased to 3 feet 9 inches, and there remained. Sir Walter Scott, in "Peveril of the Peak," makes him play an important part in bringing about the *dénouement* of that tale, and thus describes him:

"He, although a dwarf of the least possible size, had nothing positively ugly in his countenance, or

actually distorted in his limbs. His countenance in particular, had he been a little taller, would have been accounted, in youth, handsome, and now in age, striking and expressive. It was his pleasure to wear mustaches so large that they almost twisted back among and mingled with his grizzled hair."

He was employed in some diplomatic missions of great importance. Heath, in his "Clarastella," 1658, thus addressed Jeffrey:

"Small Sir! methinkes in your lesser selfe I see
Exprest the lesser world's epitome.
You may write man, in th' abstract so you are,
Though printed in a smaller character.
The pocket volume hath as much within 't
As the broad folio in a larger print,
And is more useful too. Though low you seem,
Yet you're both great and high in men's esteeme;
Your soul's as large as others, so's your mind:
To greatness virtue's not like strength confined."

Sir Christopher Wren, who was born in 1632 and died in 1723, was much below the common size; as when Charles II. told him that he thought the apartments in his hunting-palace were too low, the architect, looking up, replied, "Sir, I think they are high enough." The King, stooping to Wren's height, and creeping about in a whimsical posture, exclaimed, "Ay, Sir Christopher, I think they are high enough."

Sir Isaac Newton, who was born in 1642, was a posthumous child, his father dying at the age of ninety-six. Sir Isaac's mother often said that when he was born he was so little that he might have been put into a quart mug.

Peter the Great made a "high" festival at the marriage of two dwarfs in St. Petersburg, in 1710. For a certain day, which had been proclaimed several months before, he invited all his courtiers and the foreign ambassadors to be present at the grand marriage of this pigmy man and woman; and he ordered that all the dwarfs, both male and female, residing within two hundred miles of his capital should repair thereto and be present at the ceremony. For their convenience he supplied vehicles which would contain a dozen dwarfs at once. Some were unwilling to come, but were compelled to obey. The whole company of dwarfs numbered about seventy, besides the bride and bridegroom, who were richly adorned in the height of the fashion. Every thing provided was suitable in size. A low table held small plates, dishes, glasses, and other necessary articles, diminished to the standard of the guests. The dwarfs, with much pride and gravity, contended for place and superiority, which difficulty the Emperor endeavored to surmount by ordering that the most diminutive should take the lead. But this endeavor bred disputes, as none of them would consent to be placed foremost. However, all this being at length adjusted, the banquet was consumed, and dancing followed it; the ball being opened by the bridegroom, who was 3 feet 2 inches high. In the end the unwilling company entered into the spirit of the diversion, and themselves became much amused and entertained.

A notable little English body was John Coan,

born in 1728. He was 3 feet in height, well shaped, well educated, an agreeable companion, having an intelligent mind, and well-read, particularly in dramatic literature. He had a good voice, and when he was in spirits would keep an audience in a roar of laughter by getting on a table and singing the song of "The Cock," which he did with much humor and quaint action. In 1752 he was presented to George II. and the royal family at St. James's Palace, and repeated the following lines:

"Behold, most gracious Princes! at your feet,
In miniature, a man of form complete:
If, honored thus, too blithely I behave,
Oh, pardon at this time your little slave,
Who inward blesses his peculiar fate
That made him small, to pleasure you so great.
Let others boast their stature or their birth;
This glorious truth shall fill my soul with mirth,
That I now am, and hope for years shall sing,
The smallest subject of the greatest king."

The *Gentleman's Magazine* for 1735, under date December 20, relates in rhyme that

"A dwarf from France arrived in Town,
Measuring but Inches 21,
At Court a wonder great was shown,
Where He, tho' aged 46,
Performed 20 childish tricks."

This little fellow exhibited the tricks usually performed by "ground and lofty tumblers" in the circus. The Magazine says: "He shews some part of military exercise on his hands, as well as if he stood upon his legs. He will go to any gentleman's house if required. *Vivant Rex & Regina!*"

But perhaps the most remarkable dwarf of which there is any record, in ancient or modern times, is Count Joseph Borulawski, born in Polish Russia in 1739. His parents were of the medium size, and had a family of six children, five sons and one daughter. Three of the former, when full grown, exceeded the middle stature; but the other two and the daughter attained only that of children of about the age of four years. At the time of Joseph's birth he measured only 8 inches in length; but he was neither weak nor defective; and his mother, who suckled him herself, frequently stated that none of her children gave her less trouble than he. His sister, Anastasia, seven years younger, is represented by him, in his Memoirs, as so short that she could stand under his arms. She was a perfect model of symmetry and beauty, having a lively and cheerful temper and a feeling and beneficent heart. At the age of fifteen, being then 25 inches high, he was presented to the Empress Maria Theresa, who on one occasion took him on her lap, caressed him, and asked him what he thought was most curious and interesting at Vienna. He answered that he had seen in that city many things worthy of admiration, but nothing seemed so extraordinary as that which he then beheld. "And what is that?" inquired her Majesty. "To see so little a man on the lap of so great a woman," replied Borulawski. The Empress then wore a ring on which was her cipher in

brilliant. His hand being in hers, and he looking attentively at this jewel, she asked him whether the cipher was pretty. "I beg your Majesty's pardon," replied Borulawski; "it is not the ring that I am looking at, but the hand, which I beseech your permission to kiss;" at the same time raising it to his lips. The flattered Empress thereupon took a very fine diamond ring from the finger of Marie Antoinette, then a child, and put it on Borulawski's. The notice of the Empress procured him the attention of the whole court, and the marked kindness of Count Kaunitz. By this time the little man was about 28 inches high, could bear fatigue and lift great weights in proportion to his size, possessed mental energy and accomplishments, and a judgment very sound; understood arithmetic, spoke German and French, was ingenious in every thing he undertook, lively in his repartees, and just in his reasonings. In 1760, while Borulawski was in Paris, Count Tressan sent to the Royal Academy of Sciences the following account of him:

"M. Borulawski is twenty-two years of age, and about 28 inches high; is well proportioned, and has nothing shocking about him; his eyes are fine and full of fire; his features agreeable, and his physiognomy spirited. He enjoys perfect health, drinks nothing but water, eats little, sleeps well; bears a great deal of fatigue, dances well, and is very nimble. Nature has refused nothing but size to this amiable creature, for which she has made him ample amends by the beauties of his body and mind. His manner is extremely graceful, and his repartees smart and spirited. His judgment is sound, and his heart susceptible of the most tender impressions; he has never shown any passion or ill-nature; is extremely complacent, loves to be treated with the decorum due to his rank, yet is not offended with those who make free with him on account of his stature."

Being once upon the lap of the Princess Nassau-Weilbourg, she said, "Are you not very sorry you are not taller?" "No," he replied; "if I was I should not have the honor to sit upon your ladyship's knee." Borulawski was twice the victim of the tender passion, his first love being an actress, whom he wished to marry, but who laughed at him. The second was a young French lady, Isalina Barbutan, whom, after much opposition from his patroness, Countess Humiecka, he married. Being informed, in a few weeks after his marriage, that he was likely to become a father, and being somewhat impecunious, it was suggested that a second visit to the courts of Europe would enable him to procure the means of leading a life of comfort. The king supplied him with a convenient carriage, and off he went. In due time a daughter was born to him. He traveled over Europe, had letters to persons of the highest position, so that in a few years he was enabled to retire with ease and comfort. At the end of the last century, having been seen by some of the prebendaries of Durham, he was prevailed upon by that body to take up his abode for life in Bank's Cottage, near their city, they engaging to allow him a handsome income. He accepted this offer, and enjoyed the clerical bounty up to the time of his death, which happened at

the same cottage on September 5, 1837, when he was ninety-eight years of age. Thus closed the career of the most remarkable dwarf in the history of the world.

Quite in contrast with this modest, temperate centenarian dwarf, was a brief person of the name of Jeffries, who died of excessive whisky, so to speak, in London, in 1797. He said one good thing, which was not more true then than now:

"When you've got money you're look'd upon;
But when you've got none you may go along."

This dwarf had a wife who survived him twenty-one years, and died at the age of *one hundred and one*.

Charles Lamb wrote a paper upon a dwarf called Captain Starkey, who had been an usher at a school in Fetter Lane when Lamb's sister was a scholar there. He was a quiet, gentle person, "with a peculiar stamp of old-fashionedness." Underneath a picture of this man are the following lines:

"Reader! see the famous Captain
Starkey, in his own coat wrapt in,
Mark his mark'd nose, and mark his eye,
His lengthen'd chin, his forehead high,
His little stick, his humble hat,
The modest tie of his cravat;
Mark how easy sit his hose,
Mark the shoes that hold his toes;
So he look'd when Ransan sketch'd him
While alive—but *Death has fetch'd him*."

Of the two great American Dwarfs, Stratton and Nutt, and their little wives, we forbear to speak. Is not their history known and read of all? Are not their *cartes de visite* in every album? And are not their checks good for many thousands at any bank? What man, however great, could ask for more?

GRANT ON THE BATTLE-FIELD.

THE empire of Jefferson Davis, in the autumn of 1861, seemed as firmly established and as powerful as if it had endured for centuries. It rose like an exhalation, and dazzled or blinded the eyes of Europe, if not America. Its territory reached from the Potomac to the Rio Grande; it was larger than any European kingdom except Russia. All over this magnificent domain a fertile soil produced two great staples of the world, and it was confidently expected that Norfolk and New Orleans would soon be filled with the fleets of every land. Its people, linked together by a terrible bond, were believed to be united. Its armies, well appointed and armed, and flushed with victory, with the capture of Sumter, the easy fall of Norfolk, the battle of Bull Run, hung like a cloud over the border, and threatened Baltimore and St. Louis. Except the North, it had no enemy. The western powers of Europe opened their long line of ports to its ships and its pirates, and gave a hearty welcome to the new-born nation. They evidently believed that the days of chivalry and tyranny were come again. Can-

ada and Mexico lent it a natural sympathy. And even in the divided North there were thousands who rejoiced in the success of its Southern rival, who strove to confound the Northern plans, to burn New York, to surprise Washington, and awaken a terrible anarchy in the loyal fragment of the Union.

It is not wonderful, therefore, that a sense of exultation and of security at this moment filled the councils of the conspirators; that they presumed to treat as equals with the Court of the Tuileries and the Cabinet of Washington. For the latter, indeed, they entertained only a dignified contempt. Youthful Talleyrands from South Carolina, demi-savages from the backwoods of Mississippi, repudiators from Virginia, brigands from Texas, united in looking with polished scorn upon the fallen Government at Washington. Even to sagacious but timid men the contest seemed already hopeless; to European thinkers it was an act of madness. "How," they exclaimed, "can your armies, even had you an army, hope to subdue a country of such an immense extent, occupied by a united and hostile people, filled with strong strategical positions, and defended by some of the best soldiers in the world? How can you presume to blockade thousands of miles of sea-coast with your insignificant navy? or whence can your bankrupt and creditless Government, whose bonds are unsalable in London and Paris, obtain the vast resources of money or material necessary to an offensive war?"

It seemed, indeed, a most perilous undertaking. Our soldiers, fresh from the labors of peace, were to encounter dangers and trials seldom equaled in the annals of warfare. They were to make marches longer than that of Hannibal to Italy or Napoleon to Moscow. They were to encounter a climate, in their campaigns and sieges, which was thought malarious and fatal even to the natives. They toiled amidst swamps and fens on the coast of South Carolina and the banks of the Mississippi; they were to die by thousands in the fever hospital or the negro hut. They were about to invade a powerful nation and conquer it upon its own soil. Yet it was asserted that no free people had ever been effectually subdued, and that the South would prove as obstinate and unconquerable as Switzerland had been to Austria or Spain to Napoleon. The project of blockade seemed even less likely to prove successful. Our fleet was then chiefly a collection of merchant vessels, many of them only fitted for river navigation, many altogether unseaworthy. Our brave soldiers and seamen ventured out upon the ocean in frail steamers that must sink in the first storm, or be disabled by a random shot. Was it credible that England would recognize such a blockade? England was then in all the pride of her maritime strength. She ruled the waves almost as in the days of Rodney or Nelson. Her immense fleets hung threateningly over our shores, and no one could foresee that in the course of a few short months the

invention of a gifted engineer was to destroy her naval supremacy forever. In the face of these and a thousand other discouragements the question arose all over the land, "Can we conquer the rebellion?"

He who aided more than any other man in giving a satisfactory reply was General Grant. Yet it would be improper not to admit that the preservation of the Union in those dark and hopeless days rested in great part upon the firmness and discretion of President Lincoln, Mr. Seward, and their admirable coadjutors. To these men the people looked with confidence and affection; to them the nation intrusted cheerfully its boundless treasures of men and money; in their hands it confided its destiny. And never was a trust better fulfilled. Honest of purpose, true of heart, Lincoln and his Cabinet labored through the darkest hours of the war in almost hostile Washington, surrounded by traitors and assassins, weighed down by cares and toils, yet always cheerful, hopeful, composed. When others faltered they stood firm; when many desponded they were ever full of hope; they ruled the whirlwind and controlled the storm; and their generous names live ever in the hearts of their countrymen. But to Grant was committed the executive part of the undertaking. He was to direct the immense power of the nation to the final suppression of the rebellion. He was the first to break through the imaginary frontier of the great Confederacy; to prove its weakness or to test its strength; to check the vainglorious exultation of the rebels by a series of disastrous defeats; to pass on from victory to victory; to find all his plans fulfilled by pertinacity and vigor; with Sherman and Sheridan, Thomas and M'Pherson, and many another brave companion in arms, by sea and land, to conquer a country more extensive than the empire of Napoleon in its proudest days; often more wild and difficult of access than was Gaul to the legions of Cæsar; to answer, in fact, to the satisfaction of Europe and America, the question, "Can the Union be restored?"

At the opening of the war Grant, who had already won distinction on the battle-fields of Mexico, commenced drilling a company of volunteers, and was soon made Colonel of an Illinois regiment. He was next placed in command at Cairo, an important post at the junction of the Ohio and the Mississippi, having been commissioned as Brigadier-General of Volunteers. His first military act in this command was one that was attended by a most important result: it secured Kentucky to the Union side. This powerful State had at first professed a haughty neutrality. Its rebel Governor rejected with scorn the appeal of President Lincoln for aid in suppressing the rebellion; and the conspirators no doubt counted upon getting the control of Kentucky, and thus commanding the navigation of the Ohio. General Polk, the warlike bishop, entered the State, began to fortify Columbus and Hickman, and

occupied Paducah, a town on the Ohio, which commanded the navigation of that river. Grant saw at once the danger of the moment. He resolved to save the river and Kentucky. On the night of the 5th of September he set out with two regiments and a light battery, with two steamers, and on the morning of the 6th appeared before Paducah. The rebels fled from the town without firing a gun; a sufficient garrison was left in the place; the State Legislature soon after passed Union resolutions; and Kentucky never again declared its armed neutrality. A single act of vigor and forethought decided the conduct of a whole State.

Autumn glided away; the leaves were dropping along the banks of the Potomac and the Ohio; the fairest season of the year would soon be gone. It was a period of disaster and inaction. The awakened North had seen with shame and indignation its soldiers constantly defeated and driven back in their efforts to penetrate the hostile country; it was looking eagerly and anxiously for some one to break the spell of ill success. Grant meantime was busily employed in drilling new troops at Cairo, and probably in wondering why they were not made use of. He always believed that where both sides are equally undisciplined the most active would be the most successful. He saw Columbus grow into an impregnable fortress under the care of Pillow and Polk; he heard that the Tennessee and the Cumberland were to be closed by new fortifications; and he asked his superior officer at St. Louis, Fremont, to be allowed to take Columbus (September 10) while it was yet assailable. At length (November 1) he received orders to make a demonstration against the fortress, to prevent the enemy from sending reinforcements to their general, Price, in Missouri. Grant resolved finally to turn the movement into an actual attack on Belmont.

Columbus rises on a high bluff above the Mississippi on the Kentucky shore. It was now so strongly fortified as to be quite impregnable; armies might have wasted their strength against its lofty bluff for months without result; its long range of heavy cannon closed up the navigation of the river; and a large force of the enemy filled its walls. But it was Belmont, a post on the opposite side of the Mississippi, under the guns of Columbus, that Grant meant to threaten or assail. Here a considerable force of rebels had formed their camp, defended by rough lines of felled trees and the fire of Columbus; and it was here that the reinforcements were chiefly ferried over the river to aid Price in Missouri. Grant's aim was to destroy their camp, disperse their troops, and then return to Cairo. He would thus practice his new levies, and at the same time alarm the enemy. No sooner did the brave Western soldiers at Cairo learn that a real attack was to be made than all was exultation and excitement. They rejoiced to be relieved from the dull monotony of camp-life, and to test their courage in the fierce trial of actual combat. Grant ordered General

Smith from Paducah to make a demonstration against Columbus, to employ the enemy's attention on that side of the river, while he himself set out for Missouri. His troops, it should be remembered, were all untried men. His two chief commanders, Logan and M'Clermand, had never heard a shot fired in actual battle, and Grant stood alone in the midst of a brave but inexperienced army. His force numbered about thirty-one hundred men. After several feints he landed his troops from transports at Hunter's Point, in Missouri, and marched at once against Belmont, about three miles below. The enemy were soon found, and the brave troops, advancing as skirmishers, threw themselves against the rude defenses; the officers behaved like veterans, always in the front of the battle; the soldiers climbed, crept, or sprang over the strong abatis; the enemy were slowly driven back to the shore. Pillow, who had crossed over with reinforcements from Columbus, was forced to give way, and the disordered and broken force, larger in numbers than the assailants, took refuge under the river bank and the fire of Columbus. A strange scene followed. Grant's troops, carried away by the joy of the moment, having taken several hundred prisoners and the enemy's camp, broke into disorder. Speeches were delivered by excited orators; the captured camp was plundered; in the midst of their enemies the inexperienced soldiers believed themselves secure. Grant ordered the camp to be set on fire to drive the troops to their ranks, and suddenly the heavy guns of Columbus opened upon the Union army. Meanwhile large bodies of rebels had crossed the river, and with the aid of Pillow's men had surrounded their late victors. A startled aid-de-camp, riding up to Grant, exclaimed in alarm, "General, we are surrounded!" "Well," said he, "we must cut our way out as we cut our way in." His calmness reassured his little army, and with Grant, M'Clermand, and Logan at their head, they broke through the enemy's line and passed in good order to the landing. Here the whole force was safely embarked, with but slight loss. Grant acted as his own rear-guard, was the last man on the shore, and at one time found himself not more than one hundred and fifty feet from a line of the enemy. He paused a moment to survey them, then turned his horse's head, rode slowly away, and finally broke into a gallop as he approached the river. He made his way with difficulty upon one of the transports, and then the little flotilla moved on under a heavy fire of musketry from the shore. By five o'clock the last vessel was beyond reach of the enemy, and the successful expedition arrived safely at Cairo.

Such was the brilliant affair at Belmont. The enemy were double the number of their assailants, protected by the guns of Columbus, yet they lost one-third more men than the Unionists, were beaten from their intrenchments, saw their camp burned and plundered

at will, and suffered the successful invaders to retire unharmed. Grant's men were proud of their victory, of their leader, of themselves; and the "Belmont men," as they were called, were ever afterward distinguished for daring in the Western campaigns. But the most important result of the action at the time was that it prevented the enemy at Columbus from sending aid to the rebels in Missouri. They felt that in the presence of their active assailant at Cairo they could not venture to diminish their own forces.

Once more the Union armies were in comparative inaction. McClellan commanded at Washington, Halleck had succeeded the brave Fremont at St. Louis; and these excellent tacticians were inclined to a policy of delay. They wished to provide for every contingency. But Grant, the people, and the President were eager for action. The rebels, too, were by no means idle. Around Richmond and along the approaches to the Potomac they had collected a powerful army, commanded by an able and experienced chief, and from their capital, which was now full of gayety, triumph, expectation, they looked with confidence to the approaching struggle. In the West they were equally hopeful. With a force of nearly a hundred thousand men they occupied a strategic line reaching from Columbus on the west to Bowling Green, an important railroad centre in lower Kentucky, on the east. Columbus was defended by a strong force, and mounted one hundred and fifty guns on its powerful earth-works. It could only be taken by a long siege. At Bowling Green was gathered one of the finest armies of the Confederacy; it threatened and almost commanded all Western Kentucky. In the centre of the rebel line ran two large rivers, the Cumberland and the Tennessee, which, coming from the heart of the rebel district, flow into the Ohio. About fifty miles below that river the Cumberland and the Tennessee approach within twelve miles of each other, near the Tennessee line; and to guard their waters, as well as to preserve the connection between Columbus and Bowling Green, the Confederates had here erected two strong forts. On the banks of the Tennessee was Fort Henry, with a lesser work, Fort Heiman, on the opposite side of the river. At a distance of twelve miles, on the Cumberland, was the still more powerful work, Fort Donelson. Both these forts were strongly garrisoned, and were in constant communication with Bowling Green and Columbus.

The Union force destined to assail this line, collected under Halleck at St. Louis, Grant at Cairo, and Buell in Eastern Kentucky, can not in effective strength have been much superior to that of their opponents. Its commanders had the choice of three modes of attack. They might besiege Columbus; they could mass their strength against the Confederates at Bowling Green; they might attack the forts on the rivers. Grant pressed the adoption of the

latter plan. "With permission," he telegraphed to Halleck on the 28th of January, 1862, "I will take and hold Fort Henry." Commodore Foote seconded his request, and on the 1st of February the necessary permission arrived; on the 2d the expedition left Cairo. It consisted of seven gun-boats, partly iron-clad, under Commodore Foote, and a land force of seventeen thousand men under General Grant. The rivers were swollen by the rains, and a large part of the country was under water; the land forces were necessarily delayed by the want of sufficient transports and the condition of the country; the iron-clads, fierce monsters protected by their metallic hides from shot and shell, pressed up the hostile river, startling its banks with the hoarse panting of their engines, and arrived first before the fort. It was a series of field-works, the strongest being on the east side of the river, and mounting seventeen heavy guns. A garrison of twenty-eight hundred men, under the command of General Tilghman, defended the post. General Grant passed up in a steamer under the enemy's fire to try the range of their guns, and then returned to hasten the advance of his army. Tilghman, in the mean time, fearful of being surrounded, had resolved to abandon his position, but awaited the attack of the navy in Fort Henry with just enough men to manage his guns. Grant had ordered an immediate attack; and on the 6th January at eleven o'clock his forces began to move up the river to the fort. While they were on their way, however, its fate had been decided. The iron-clads and gun-boats under Commodore Foote steamed up and commenced a rapid fire upon Fort Henry. Tilghman's guns replied with great vigor and effect; a shot disabled the *Essex*, wounded its commander, Porter, and killed and wounded twenty-nine men. But very soon the fire of the fort was silenced; Tilghman surrendered at discretion; the greater part of the garrison escaped to Fort Donelson; and when Grant arrived, half an hour afterward, he found himself the master of the powerful work. His plan having been thus far successful he next determined to take the companion fort on the Cumberland, and telegraphed at once to Halleck: "Fort Henry is ours! I shall take and destroy Fort Donelson on the 8th."

But he was deceived. The winter rains fell heavily; the whole country was under water; his army scarcely saved their baggage from the flood; and it was not until the 12th that his main body of fifteen thousand men, the weather having cleared up, could move toward Donelson. Yet he had used the greatest expedition, for he heard that the enemy were gathering all their strength in defense of the fort. Foote led his shattered navy up the Cumberland, and a little after mid-day of the 12th Grant drove in the enemy's pickets. His movement might seem almost rash in its daring. He was in the centre of the enemy's grand strategic line. Behind him was Columbus, before him Donelson,

sustained by the abundant resources of Bowling Green. The force in the fort itself was greater than his own, and he was about to besiege a garrison superior to his own army in strength, defended by long lines of works that gave them every advantage for an attack. To an inexperienced eye Donelson would have seemed impregnable; it was a series of intrenchments on the west bank of the Cumberland, seated on hills and rugged ground often over a hundred feet high, surrounding a lofty central fort that covered a hundred acres of ground. Fifteen heavy guns, with some carronades, armed this work; below it, on the hill-sides, were water-batteries commanding the river. The garrison numbered nearly, if not quite, twenty-one thousand men, and they were in open communication with Bowling Green, the centre of the rebel armies.

Few, therefore, whether military or civilian, thought Donelson assailable in that period of doubt; no one would have been surprised had Grant's attack proved another Ball's Bluff and Edwards's Ferry. Meantime his brave soldiers, chiefly from Illinois, sat down in excellent order before the fort; but at first all was disaster. A gallant attack had been made upon a rebel battery, without Grant's orders, which failed. Brave Commodore Foote assailed the fort from the river with his shattered fleet, and was driven back with severe loss; his gun-boats were rendered incapable of further service, and he himself was wounded. Grant looked eagerly for reinforcements that did not come. Suddenly the winter appeared in all its severity; the nights were intensely cold; men froze to death in the lines; sharp tempests of sleet and snow on the night of the 14th rained upon the hapless soldiers, who lay upon the bare ground, without tents or blankets, afraid to light fires lest they might prove marks for the enemy's sharp-shooters. Yet, such was their ardor in their cause, their confidence in their commander, that men who had never slept out of comfortable homes, or felt the hardships of a campaign, now lay cheerfully on the frozen ground, with their arms at their side, and when the enemy attacked met them with the calm courage of veterans.

At two o'clock in the morning of February 15, 1862, an eventful day, Grant was summoned by a message from the wounded Commodore to meet him on his flag-ship. He went before daylight. The force of the besiegers had been considerably reinforced, and now amounted to about twenty-one thousand men; and the long line of Union troops lay on their arms, expecting a difficult siege, and looking almost hopelessly upon the well-fortified heights before them. But Grant's energy and the increase of his army had filled the rebels with alarm. They had already resolved upon flight. Buckner, Floyd, Pillow, Forrest, their chiefs, had met in council and planned to cut their way through the Union lines on this very morning when Grant was on the river. In the chill winter

dawn the rebels massed their forces in one corner of their fort, and leaped down fiercely upon M'Clelland's division, which was nearest the river bank on the south; they hoped to break through the line by an overwhelming attack. But the Union troops, although surprised and driven back, behaved with singular resolution; new regiments came up to the aid of their fellows; a large part of the army was engaged; and by nine o'clock the rebels, who had fought with the vigor of despair, had ceased to attack. Then Grant came riding in, and at once ordered an assault. C. F. Smith gallantly led the famous Iowa Second Infantry in two lines up a steep and thorny hill, broke the rebel lines at point of bayonet, and took possession of a position within their intrenchments that decided the fate of the fort. Meanwhile, on the other side of the works, M'Clelland and Wallace led their weary troops in a fresh charge against the enemy, recovered the ground they had lost in the morning, and closed up the avenue of retreat. Night came, and the battle ceased. The weary soldiers sank on the cold ground to slumber. Smith and his companions slept on the frozen hill they had won; Grant in a negro hut.

But on that memorable night there was no repose for the rebel chiefs. They met in a second council in their powerful strong-hold to debate, with fierce regrets and vain recrimination, the best plan of escape. Floyd and Pillow resolved to abandon their troops and save themselves; they made their way down the river in the night. Forrest waded through a half-frozen stream with his cavalry, and reached Nashville. Buckner was left in command, raised a white flag on Donelson, and sent a messenger to Grant asking for terms. Grant made his memorable reply: "No terms except unconditional surrender can be accepted. I propose to move immediately upon your works." Then Buckner yielded, and Donelson fell. Fourteen thousand prisoners, sixty-five guns, and a vast amount of stores and small-arms came to the victors, the command of two great rivers, and a pathway to the centre of the rebellion.

A cheer rang out over the exultant North when the news flashed over the land. The spell of ill success seemed broken, and the name of Grant was a sound of good omen. There had prevailed, indeed, among many at the North a superstition, coming down from the Middle Ages, that the industrial classes did not make good soldiers; that men coming from the farm or the factory were incapable of self-defense; that they must be the natural prey of the wild chivalry of the South, who had been accustomed to handle the bowie-knife or the pistol from boyhood, and who, in their half-savage country, had ruled over their fellow-citizens by brutal violence and noisy assumption. It was this class that had driven the South into the war; that filled up its armies and controlled its councils; that had conquered at Bull Run, and since then had never ceased

its vainglorious boasting. But now the gallant regiments just gathered from the farms and factories of Illinois and Iowa, led by one of their own men, had met the boasting chivalry on less than equal terms, besieged a larger force than their own in a powerful fortress, beaten them in a moment of surprise, stormed their works, and forced them to surrender or to a disgraceful flight. It was the triumph of moral and mental vigor over vain pretense. It proved of what Northern soldiers were capable when well commanded. It showed that the vast preparations of the nation for suppressing the rebellion would not be in vain.

But the results of the fall of Donelson still further awakened the enthusiasm of the people. They were such as no civilian could have anticipated. As Grant had foreseen, he had broken the enemy's great strategic line: a chain of fortresses fell with Donelson. Bowling Green was at once abandoned as untenable; Nashville surrendered without a blow; Columbus, the impregnable fortress which commanded the Mississippi and threatened the Ohio, was deserted by its garrison; Missouri was made secure; Kentucky was freed from its invaders; and the great State of Tennessee, larger than many a European kingdom, was again restored to the Union. Grant was now made a Major-General of Volunteers by President Lincoln and Secretary Stanton, and placed in command of a department that was not limited in extent to the southward. The nation looked to his future career with new hope. Several other successes meantime had increased the general confidence. In January, before the fall of the two forts, General George H. Thomas had won the battle of Mill Spring. General Butler and Commodore Stringham had begun a series of naval victories by a successful expedition against Hatteras Inlet; Burnside captured Roanoke Island; and finally Farragut and Butler, in April, 1862, entered New Orleans. Again the North rang with hearty cheers as the gallant exploit of Farragut was told from man to man. Cities were illuminated; flags hung from every house; the churches offered thanksgiving, and peace seemed near.

Grant's next battle was at Shiloh; a victory so signal that if he had been permitted to follow it up Vicksburg would have fallen, and the war might have had a speedier close. Yet such were the misrepresentations that were long allowed to hang over the result of this contest that many believed, both at the time and afterward, that Shiloh was an actual defeat of the Union army. Eager to press upon the enemy in the centre of their strength, Grant, at the head of a force of about thirty-three thousand men, had placed himself, in the first days of April, on the lower side of the Tennessee River, at Pittsburg Landing, near Shiloh. He knew that a superior force of the enemy was on his front, commanded by two of their best officers, A. S. Johnston and Beauregard, and had sent orders to General Buell to hasten up with his

division to his aid. He was eager to make the first attack, but was ordered to remain on the defensive. On the 5th Buell's forces, delayed on their march, had not yet arrived. The enemy, who knew Grant's weakness, resolved to crush him by a vigorous attack before his reinforcements came. The position of the Union army had been carefully selected; it was protected on either side by two small rivers running into the Tennessee, and also on one of the sides by a deep ravine; in front the ground was broken and thickly wooded, and here the enemy would be obliged to make his attack. Sherman's division, and those of M'Clermand and Prentiss, were in advance, and on them the first fury of the battle fell. About daybreak of Sunday, the 6th of April, 1862, Johnston, with from forty to fifty thousand men, threw himself upon the Union line, with a courage and resolution unsurpassed in the history of the war. Ably led and managed, the enemy's charge had all that spirit and fire which a bold attacking force always possesses, while their superiority in numbers enabled them to press back the Union line almost by their physical strength alone. It happened, unfortunately, that Sherman's division was composed chiefly of new recruits who had never heard a shot fired in battle, and many of whom, as the danger drew near, fled shamefully in a panic-stricken throng to the landing. A part of Prentiss's division also gave way; and nothing but Sherman's courage and skill could have atoned for this disaster. Wounded and feeble, he still rallied his faithful regiments, and, aided by M'Clermand, W. Wallace, Prentiss, and the other division commanders, presented a bold front to the foe. Slowly the Union lines were driven back toward the river; the carnage on both sides was fearful; it was the most terrible fighting, Sherman said, that he had ever seen; the brave rebel general, Johnston, fell on the battlefield, and Beauregard took his place; but the Union lines were never broken, and as they retreated toward the river their faces were still toward the foe. At length the rebels made a last fierce assault upon the ravine; they saw their prey escaping, and they rushed with fierce shouts against the last defenses; but the Union line stood unshaken; the gun-boats from the river poured in their fire upon the foe, and they retreated. The battle lasted from daybreak until about five in the afternoon, during all which time Grant, Sherman, and their brave commanders and soldiers knew no repose. Grant was struck by a ball but not injured; Sherman was slightly wounded; General W. Wallace was killed; General Prentiss, who acted with signal courage, was taken prisoner. The loss of the rebels was nearly if not quite equal to that of the Union army, except that the latter lost several thousand prisoners.

It is a remarkable fact in the history of the first day's battle that two divisions, numbering many thousand men, who were scarcely five miles from the battle-field, and who were or-

dered by General Grant to march at once to the aid of their fellows, did not arrive until the battle was over and the position secure. If these fresh troops had reached the scene by noon, or if General Buell's forces had been at hand, the repulse at Shiloh might have been turned into a most disastrous defeat for the foe. That night Beauregard slept at Shiloh church. He had won all the Union camps; had driven in their lines; had taken many prisoners; but he felt that his shattered forces were incapable of any vigorous resistance on the morrow. He had wholly failed of his object, and nearly destroyed his army. All night a tempest of rain fell on the wounded who were left on the battle-field, and on the Union soldiers who slept on their arms. But early the next morning, at the head of the fresh troops who should have decided the fight of yesterday, Grant attacked Beauregard, and easily drove him from the field. All the strength and ardor of the rebel army was gone. They still fought well, but they fought without hope. Of forty thousand gallant men who rushed to the capture of the Union post on Sunday not twenty thousand were now fit for battle; and had Grant been permitted to pursue this broken army, as he wished to do, it is scarcely possible that they could have escaped. His policy had always been that of a rapid attack, a quick pursuit; and like the elder Fabius, who threw down all Cato's intrenchments and bade him trust only to his soldiers' valor for defense, Grant would at once have swept Mississippi with his powerful army and followed the enemy without a pause. His superiors, however, disapproved of his plans. He was deprived of his large army, and left with only twenty thousand men to hold Corinth, a fortified station in the heart of the enemy's country. His chief care must now be to save himself from falling a sacrifice to their superior resources.

Halleck was placed in the chief command at Washington. Again the nation had been plunged in gloom by a succession of disasters. Shiloh was for many months the last success. The vast and well-appointed army which in the spring had set out so hopefully for the capture of Richmond, was seen flying past the defenses of Washington, broken, disordered, more than decimated, and rapidly pursued by the triumphant squadrons of Jackson and Lee. Washington itself was all summer in actual danger. The triumphant foe invaded Maryland; Baltimore and even Philadelphia were threatened; and at length the battle of Antietam closed a campaign which seemed to have destroyed forever the hope of a successful termination of the war. In the West the prospect was no less discouraging. Bragg's army, in spite of all the efforts of Buell, who had assumed the command of the forces lately under Grant, had broken into Tennessee, and seemed likely to press onward to the Ohio. The fruits of the fall of Donelson had nearly been lost, and once more the Government at Richmond could point to a series

of successes worthy the arms of a powerful nation.

During this period of dismay and disaster Grant, almost abandoned by the Government in the general ruin of its affairs, was forced to provide for his own safety by incessant vigilance, and to oppose, in a series of successful movements, the superior numbers of his foes. He was stationed at Corinth in the upper part of Mississippi, in a hostile country, with scarcely twenty thousand men. The enemy could bring into battle nearly forty thousand, commanded by bold and active leaders. For supplies Grant must look to the long chain of railroads and posts connecting him with the Ohio or the Mississippi. On the south Vicksburg separated him from New Orleans. On the north and west his communications were liable to constant interruptions. If Buell's army were cut to pieces by Bragg there would be little hope of escape for Grant. In the midst of these dangers Grant relieved himself by inflicting two defeats upon the foe. He contrived to attack Price separately at Iuka; and Rosecrans, under his direction, afterward repulsed the whole force of the rebels from Corinth, which Grant had carefully fortified. He was now aided by that brilliant young officer, M'Pherson, too early lost; and the successes in Grant's department were the only cheering news that at this time lightened the public gloom.

By October, 1862, Grant's army had been considerably reinforced. He now urged Halleck to be allowed to plunge into the heart of hostile Mississippi and to take Vicksburg. This powerful fortress was the last obstacle to the command of the great river, and it had long been Grant's chief desire to capture it as he had captured Donelson, and thus lay open the whole of the Mississippi region to the free navigation of the Union fleets. If Vicksburg fell the Confederacy would suffer an almost mortal blow. It would be cut off from the supplies it had been accustomed to obtain from the rich fields of Texas and Western Louisiana: from great droves of cattle, from abundant stores of corn, and from the arms and ammunition it had been in the habit of obtaining through its foreign allies at Matamoras. But Vicksburg was now so strongly fortified by art and nature as to be impregnable to any direct attack. It was seated on a series of high bluffs at a bend in the river, so elevated as to be above the reach of the guns of the naval force. On the north a range of high land and the Yazoo River protected it from attack. Around it were dismal swamps and fens, wide wastes of land overflowed by the Mississippi, a rough and broken country, ravines, forests, and bayous. Every point, too, in its neighborhood, capable of defense, was covered with earth-works and defended by cannon; and its inaccessible height seemed to well deserve the appellation Jefferson Davis gave it, of the Gibraltar of America. Its garrison numbered about thirty thousand men; but it also formed the rallying-point of several detached

armies of the Confederates, who kept open its communications and aided it in its moment of need. Below Vicksburg on the Mississippi two other powerful and well-fortified posts—Grand Gulf and Port Hudson—also seated on high bluffs, formed part of its defenses, and the three fortresses mutually aided each other in commanding the navigation of the river and opening a connection with the western shore.

On one point alone was Vicksburg vulnerable. Its supplies came chiefly from the interior of the State of Mississippi; it was connected by railroad with the capital, Jackson; and if Grant could interpose his forces between that city and the fortress it must be starved into surrender. Hence his chief object in his long and painful campaign against Vicksburg was to bring his army below the city, destroy Jackson and the railroad, defeat the hostile forces, and approach Vicksburg from the south. Yet he seems not to have decided definitely upon this plan until he had fairly tested the strength of its fortifications on the upper side, and in December, 1862, a combined attack was planned, by which Grant and Sherman were to advance in two strong columns from the north, strike the defenses of the city on that side, and take it by assault. It is possible that under two such leaders such an attack might have proved successful. Grant advanced rapidly toward the rear of Vicksburg, and drove the enemy under Van Dorn before him; Pemberton had fallen back to Canton, a few miles above Jackson; Grant sent orders to Sherman to move, when suddenly there occurred one of those unaccountable disasters in military affairs which so often disconcert the wisest plans. Holly Springs, a town on Grant's line of communication in his rear, although carefully fortified and garrisoned by a thousand men, was surprised and captured by a cavalry force of the enemy under Van Dorn. Colonel Murphy, its commander, although he knew of the approaching danger, made no preparations for resistance. He was afterward dismissed the army for his misconduct, but his cowardice had defeated for the time the plan of a combined assault. An immense amount of stores had been destroyed at Holly Springs; the subsistence of the army was cut off; for nearly two weeks Grant was shut out from all communication with the North, and he was obliged to move back to Holly Springs, where, by December 23, he established his head-quarters.

When Pemberton, the rebel general, heard of Grant's retreat he threw himself into the defenses of Vicksburg and awaited the approach of Sherman. This bold leader, at the head of about forty thousand men, descended the Mississippi from Memphis, hoping to take the fortress by assault while Pemberton's army was employed in opposing Grant; and he little suspected, as he prepared to make his vigorous charge against the fortified bluffs on the Yazoo, that they were defended by a force as large, if not larger than his own. His brave soldiers

landed hopefully in swamps and quicksands, amidst deep ravines, wild shrubbery, and a region overflowed by the rising river; threw themselves with Western energy against the fortified hill-sides; waded fighting to the enemy's intrenchments through bayous three feet deep, with bottoms of shifting sand; captured several positions; fell thickly before the cross-fire of the numerous batteries and ten thousand rifles, and then were withdrawn in calm array. It was another "charge of the six hundred." The attempt was hopeless, and on the second of January, 1863, Sherman led his shattered expedition to the transports and passed out of the Yazoo. Nothing could now exceed the joy of the rebels. To foil Grant and Sherman, whose merits they at least had perceived; to drive back the famous Western soldiers whose vigor they had so often felt from Donelson to Iuka; to prove the invincibility of their great fortress in the West, completed that proud self-confidence with which they had beheld the discomfiture of the Army of the Potomac, and the terror with which Bragg's march to Louisville had filled Ohio and Pennsylvania. The close of the year 1862 left the Confederates victors on every field. In politics the opposition party had won the elections at the North, and seemed ready to embarrass the Government by its unfriendly policy. European writers, in laborious essays in leading reviews, showed with the utmost clearness that the Union was forever gone, and gently suggested that its destruction was a benefit to mankind; France stretched out a velvet hand to save Mexico from the general conflagration; England grew rich by blockade-running, privateers, and the splendid prospects of the Confederate Loan; while her wonderful Lancashire operatives starved rather than lend aid to the cause of slavery, and thus saved us a decade of war; and again ambassadors from Richmond were in close correspondence with the busy diplomatists of western Europe.

At this moment of confusion in our national affairs, when the Government was unpopular and tottering, the country divided, the national credit nearly gone, all our armies retreating, the enemy on the advance, whose hand could stay the wave of ill success? Statesmanship was no longer of any avail; it could create but not command armies. Poetry, oratory, history, philosophy, were powerless to avert the ruin of a nation. Intellect had ceased to be sufficient, except intellect of the rarest form. We wanted an Epaminondas rather than a Demosthenes—a Scipio rather than a Cato; we wanted some one who could wield the sword. Grant still hovered over Vicksburg. If his attack had failed in the north he had still various other plans by which to assail the haughty fortress. His aim from January, 1863, was to turn its batteries, to transport his fleet and army to the south, to cut off Vicksburg from its resources, and inclose it with his gallant troops. In all his laborious efforts to accomplish this design he was assisted with unfaltering energy by Com-

modore Porter and his admirable officers and crews. He had, too, ever at his side Sherman and M'Pherson, his devoted aids; and his gallant army, disciplined by trial, moved with the precision of a machine in every path of duty. From January, 1863, to July 4 the campaign against Vicksburg was pressed with a resolution that, in the face of a thousand difficulties, finally led on to success.

The first method proposed for getting below the city was the famous canal. Opposite the bluffs of Vicksburg the Mississippi pursues so eccentric a course as to produce a long, narrow peninsula, hardly more than a mile in width, projecting far into the river. It was plain that if a canal could be cut across this neck of land, beyond the reach of the guns of the fortress, the stream might be turned from its usual channel, Vicksburg be left far in the front, and Grant's army be carried down the river in transports to any point below that might afford a favorable landing. The design seemed very attractive. President Lincoln was anxious to have it tried. Grant never had approved of it; but in order to keep his soldiers from idleness he consented to go on with the work. Thousands of men were employed in January and February in enlarging or improving the canal begun by General Williams; the river was rising, and tall levees were raised to protect the workmen; the canal slowly advanced. It struck the general attention. New York and Washington watched its slow progress. The rebels in Vicksburg ridiculed it, and sometimes threw shells among the laborers. But they had already made it altogether useless by raising new batteries on the Vicksburg shore that wholly commanded its outlet. At length, on the 8th of March, a rapid rise in the river took place; the embankments on the peninsula gave way; the waters flowed in wild inundation over the western shore; and workmen and soldiers fled in terror to the higher ground. The famous canal had now perfectly failed.

Several other projects for opening a free navigation through the low and marshy country around Vicksburg were tried by Grant and his accomplished engineer, M'Pherson, chiefly, probably, for the purpose of giving employment to his men during the season of high water, when no movement of the army could be made across the inundated lowlands. One was the Lake Providence route, which was intended to unite all the bayous, rivers, and swamps on the west side of the Mississippi through Louisiana, and thus to divert the course of the river to a new channel which would have left both Vicksburg and New Orleans far in the inland; another, to form a similar passage behind Vicksburg by enlarging and clearing the interior rivers. But Grant had little confidence in any of these projects. He had already resolved upon a bold plan for his future campaign, which all these apparently useless labors served to cover from his opponents. Meantime various daring and successful attempts had been made by Com-

modore Porter's naval force to pass the batteries at Vicksburg, which were of signal service in producing the fall of the city. On the night of the 16th of April the fleet was prepared for a general attempt to get below the enemy. Porter's seven iron-clads were to engage the batteries, while a fleet of river steamers, protected by cotton-bales, and manned by volunteers from the army, were to run the gauntlet of fifteen miles of continuous fire. The night was dark; the flotilla moved silently down the river; Porter, in the *Benton*, led the way. Grant watched the movement from a transport above the bend. But suddenly the enemy discovered the leading vessels, and a shower of shot and shell poured in upon the long line of almost defenseless ships as they sailed into the awful pass. The river was lighted up by the flash of an incessant cannonade; the enemy set fire to houses on the shore in order to guide their aim, and the light, bright as day, streamed over the waters. Every object was visible, and the brave voyagers saw as they passed the soldiers in Vicksburg training the guns that were to hail death and wounds upon their helpless vessels. At length, about midnight, the ships were opposite the centre of the city, and here every shot from the hostile shore took effect. Every vessel was struck in the awful rain of the most destructive missiles; the sides of the strongest iron-clads were crushed in; rigging was torn to pieces, smoke-pipes riddled, vessels pierced from side to side; the transport *Henry Clay* took fire and floated down the river, a blazing beacon of evil omen to the army encamped below. For two hours and forty minutes the fleet was exposed to the merciless fire; but slowly the shattered vessels drifted out of range, with comparatively little damage; the attempt was successful beyond expectation; the blazing fires burned out; the batteries ceased to roar; and silence and darkness once more settled upon the beleaguered city. Not long after this brave exploit a number of barges and steamers made their way past the batteries; yet it is certain that there never was a bolder act than the attempt to pass the cannon of Vicksburg.

Grant, thus aided by a powerful fleet, had now unfolded the plan of his campaign. He was about to move his army down the Louisiana side of the Mississippi, cross the river at some favorable point, and throw himself in the midst of the enemy's country. But in the meantime his long and apparently useless delay before Vicksburg had sunk him low in the public esteem. His slow movements, the failure of his canals and other devices, disappointed the people. They looked for rapid success, and could not wait for the slow progress of a great design. President Lincoln, too, seems to have lost confidence in Grant; military authorities denounced him; it was said that he had wasted his fine army in useless labors, and that its strength and hope were gone. It was even proposed to remove this unlucky commander, and put M'Clermand, Hunter, Fremont, or McClell-

lan in his place. But now Grant pursued a course of conduct which seems to have been still less in accordance with the usual tactics of the time. He led his fine army, with infinite toil, through the swamps and wild-woods of Louisiana, on the west side of the Mississippi; crossed again below Grand Gulf to the Mississippi shore, and, with a force of only thirty thousand men, marched into the hostile country. But of these thirty thousand every man was a soldier, bound to his chief by the subtle bond of perfect trust. Sherman and M'Pherson were with him; and he did not fear to encounter twice his own numbers; he was now certain of success. It would be impossible to enumerate all the rare achievements of this band of heroes. They carried with them no supplies, but lived upon the corn and beef of the fertile country. They were in perfect health and vigor, and felt as if they could march over Vicksburg, said one of them, to the Mississippi. They threw themselves between two powerful armies; defeated them separately; turned and captured the powerful works at Grand Gulf; took and destroyed Jackson, the capital of Mississippi; routed Pemberton at the well-contested battle of Champion's Hill; and finally drove his dismayed and shattered army within the walls of Vicksburg. All this was done within twenty days. Haines's Bluff and the strong defenses of the rebels on the Yazoo fell into Grant's hands, and his triumphant army of heroes advanced at once upon Vicksburg itself.

The true siege of the city now began. High over the attacking army arose a range of hills fortified with a skill seldom equaled in the annals of war: covered with cannon, lined with a maze of intrenchments, inclosing three lofty fortifications, each in itself apparently an impregnable castle. Nature had done even more than art for the American Gibraltar, and its rear was so protected by deep ravines, gullies, and sandy precipices that no force could approach it except in scattered parties. It was defended by a garrison of more than thirty thousand men, who had resolved to give their lives to the preservation of a post which now seemed the keystone of the Confederacy. Never were there braver men, never more devoted women, than those who now occupied the fated city. Johnston, after the loss of Haines's Bluff, had ordered Pemberton to abandon Vicksburg; but the latter refused to obey. His soldiers were confident that they could maintain their position until they had received aid from the Eastern armies. Pemberton, resolved to stand a siege, gave directions to the inhabitants to leave the city; but they said they desired to remain and share in all the dangers of bombardment and assault. Grant, hoping to take the city by storm, had ordered a general attack on the 19th of May, which failed. On the 22d, at ten o'clock, he began another in concert with the fleet. The vessels opened a bombardment which lasted through the morning; the land batteries encircled the city with a girdle of fire.

At length Grant's whole army, led by its brave chiefs, advanced up the hills and strove to break the enemy's lines; but each corps recoiled before the fatal strength of the rebel position, and was forced to retire with great loss. It was a most disastrous check, and the commander had evidently counted too much upon the dismay and discouragement of the rebels. It was evident that they were about to fight with the vigor of despair for the command of the Mississippi.

Grant, therefore, prepared for a long siege. His army, weak in numbers, but not disheartened, began to erect a line of intrenchments around Vicksburg, reaching from Haines's Bluff on the Yazoo, once so formidable to Sherman, to the Mississippi and Porter's fleet on the south. The hot summer came on; the land was parched and dusty; the weary soldiers toiled in that severe climate with a patient calmness that promised success. But their labors were redoubled by the danger that threatened their rear. It should be remembered that at the moment when Grant entered the hostile country around Vicksburg the Confederate armies were triumphant in the East. Bragg, it is true, slowly retreated before Rosecrans, but it was only to fix himself at Chattanooga; he was luring his opponent to his destruction. On the Potomac all was ruin and disaster to the Union arms. Lee was pressing on toward Pennsylvania; each Union commander had suffered some severe defeat, and the public had lost confidence in its armies; the crisis of the war was at hand, and many discouraged Unionists even talked of submission and peace. At such a moment Grant was in the heart of the Confederacy, surrounded by a hostile population, besieging a fortress garrisoned by a force not much less than his own, far from his supplies, cut off from a retreat, and conscious that he must enter Vicksburg or suffer a disastrous defeat. Meanwhile in his rear was gathering a powerful Confederate force under Johnston, one of their best Generals, who was ready for any desperate effort to break the siege. Grant felt that his position was full of danger. A combined attack from the fortress and the skillful Johnston might at any moment be looked for; Davis might send on from triumphant Richmond a force sufficient to overwhelm him; Bragg might defeat Rosecrans and rush to the aid of Vicksburg. All around him the enemy were stirring. Milliken's Bend was attacked; in Louisiana hostile forces threatened the opposite shore; and Grant, although his army had gradually increased to sixty thousand men, had yet drawn in his rear a powerful line of intrenchments, extending from Haines's Bluff to Black River, that shielded him from sudden attack. Like the Romans at Capua, he was inclosed in a series of wonderful works equally formidable both in front and rear. Johnston never ventured to attack him, and lingered, like Hannibal, vainly hoping for an unguarded moment or a strategical mistake.

The siege proceeded slowly and painfully; the eager and disheartened country watched it with but little hope. The glow of expectation had been crushed by the disappointments of two years of unsuccessful warfare. Many feared that Grant would be lost in the distant and unknown land; some believed him rash and inconsiderate; and the rebels every where pointed to the dangers by which he was environed. "Johnston," they said, "with sixty thousand men, was about to fling himself upon the rash invader; all Mississippi was in arms; every Western rebel was a hero; the country was rising; and soon the brave garrison of Vicksburg, descending from its height, would join the forces without and sweep away, in an irresistible tide, the sick and disheartened besiegers." But the threatened inundation never came. Johnston forebore to attack, and still the famished garrison saw stretching far away beneath them the long array of the Union intrenchments; still the shot and shell rained upon them; still the blazing sun of summer poured down its burning rays upon that overcrowded height. Yet the condition of the Union army was little more favorable than that of the besieged. The hot sun of the South, the damp nights, the malaria of swamps and fens, spread fevers through the camp. Water was scarce, and on that bare and arid plain it grew almost as precious as in Arabian deserts. A well was more valuable than a mine of gold; a shower of rain more welcome than that of Danae. In dreary sands and intolerable heat the besiegers pressed on their works, cut trenches through the broad ravines, pierced the hill-sides, slowly crept from station to station, until from their lines they could almost touch the enemy's walls. Several mines were sprung of almost unequalled dimensions. In one more than two thousand pounds of powder were exploded; the earth opened like the crater of a volcano, and the city shook upon its hills; in another an entire redan was blown into the air. The earth around the fortress was tunneled by innumerable mines, and it seemed as if the untiring besiegers would soon excavate a way into the city.

And now Grant felt that his prize must soon be won. On the 1st of July he had prepared for a general assault on the 6th; but Vicksburg was spared from the final struggle that usually concludes a vigorous defense. It surrendered on the 4th of July. Pemberton and Grant met under a tree about two hundred feet from the enemy's lines; the works on both sides were filled with throngs of unarmed men gazing eagerly upon the conference. Terms were at length arranged, and on the 4th of July Grant rode into the city, followed by his staff and Logan's division. He was received with cold discourtesy by the hostile chiefs, his prisoners; but the gallant soldiers of both armies readily mingled in friendly groups. Nearly thirty-two thousand prisoners were paroled; and as they passed slowly and sadly between the serried

lines of their captors no word was uttered, no cheer was raised to remind these brave men of their humiliation. But tears were seen to trickle down many a war-worn cheek among the captured soldiers as they wound in a long procession out of Vicksburg.

Thus fell this famous fortress, and with it sank forever the rebellion in the West. Grant received due honors for his great achievement, and even the most cautious strategists were now forced to confess that his bold tactics were better than their own. The enemy were soon driven far from the Mississippi; Port Hudson soon after surrendered, and at length the great river of the West rolled untroubled and peaceful to the Gulf. In coming centuries, when a vast population shall have gathered along its banks, and when a countless throng of busy cities, full of culture, intellect, wealth, and ease, shall have made the valley of the Mississippi the chosen home of freemen and the garden of the world, historians will point to the heights of Vicksburg and relate how it was once held by a band of traitors, and how the brave chief and his Western soldiers, with unequalled labors and sufferings, crushed rebellion and made the great river once more free—forever free from the bitter blight of slavery, from the slave gang and the slave coffle, from the mental and moral ruin that otherwise must have necessarily fallen upon a people the foundation of whose society was laid upon a great political crime.

History has no exploit more remarkable than that which Grant and his war-worn soldiers were not long after called upon to perform. On the southern shore of the Tennessee River, amidst a confused throng of the Cumberland Mountains, lies Chattanooga, or the "Eagle's Nest." It is a low point of land a few miles in circumference, bounded on all sides in the rear by tall, precipitous peaks, and in front by the Tennessee. Yet Chattanooga is the gateway from the North to the extreme South, and a net-work of railways here meet, coming down from Knoxville or Nashville, entering the narrow pass between the mountains, and radiating in various directions to Atlanta, Charleston, and Mobile. To secure this pass had long been a favorite aim of the Union commanders. When Bragg retreated before Rosecrans, in the autumn of 1863, he endeavored to defend Chattanooga; but when his too active opponent plunged boldly among the mountains, spreading his army along the difficult roads, Bragg took advantage of his imprudence to inflict upon him a terrible defeat. With sixty thousand men he attacked Rosecrans at Chickamauga. The right wing of the Union army was destroyed, and the whole force must have been crushed and beaten had not General Thomas, the most unflinching of commanders, held his position with an iron firmness that has seldom been equaled in warfare. Rosecrans then withdrew his disheartened army to Chattanooga; but here he was besieged and held in a kind of prison by the large forces

of the rebels. Bragg fixed his head-quarters on Missionary Ridge, a long mountain range encircling Chattanooga on the south and east; while on the west he had seized upon Lookout Mountain, a high peak piercing the clouds, that inclosed in that direction the unfortunate Union army. Below this mountain ran the Nashville Railroad, the only line of communication open to Rosecrans, and this Bragg commanded by his guns on Lookout, and held with his troops. From his post on Missionary Ridge the rebel chief looked down exultingly on his prey below, now and then threw shell into their encampment, but resolved to await the effect of famine and starve them into surrender or flight. The only means by which Rosecrans could obtain any supplies was a rude mountain road over the Tennessee hills in front, but this was soon found to be almost impassable. The Union soldiers were reduced to half-rations; famine preyed upon them, and they awaited faint and feeble for the inevitable moment of surrender. A general exultation filled the South when the news of the impending fate of the invading army was told. Bragg boasted that he had his prey as in a vice. Jefferson Davis came down from Richmond to gaze with joy from Missionary Ridge upon the starving army at his feet. New York and Washington watched with helpless alarm the condition of their brave troops, and dreaded a disaster that would more than atone for the fall of Vicksburg and the conquest of Mississippi.

One man alone was thought capable of saving Chattanooga. As in the days of romance, when some single knight of rare renown rode into the gallant tournament, and by his sole address and vigor, restoring the victory to his fallen colors, beat down a *Front de Bœuf* or a *Bois de Guilbert*, so men instinctively believed that if Grant were in the beleaguered lines the starving army might yet be saved. But he to whom the nation thus turned in its distress was now lying maimed and bruised upon a bed of pain. At a review at New Orleans Grant had been thrown from his horse and severely injured. He spoke, indeed, of his accident with his usual hopefulness; he said he would soon be well again, and at the service of his country. But for twenty days he was confined to his bed; and when, in the pressing need of the moment, he came too early from his chamber he was still a cripple, scarcely able to move. He was now at the head of all the armies west of the Alleghanies, and his weary brain and feeble frame were weighed down by the care of a nation's destiny. Grant, as soon as he could act or move, sent word to Thomas not to give up Chattanooga. "I will hold it," replied the modern Ajax, "until I starve." Soon Grant came to East Tennessee, pressed down with a small attendance to the mountains, and in his crippled state made his way over the almost impassable defiles. Often he was carried in the arms of his men over ravines and broken places; often the faithful soldiers bore in their arms not Cæsar's destiny but that of

freedom. At length he entered Chattanooga. The rain fell in heavy showers; the commander was drenched, weary, and in pain; and when he came to the camp he was met by throngs of famished and desponding soldiers who had long lost hope. Above him rose the line of encircling mountains, apparently too steep for even the curious traveler to ascend; along their top he saw the flags and pickets of an army greater than his own. His provisions, notwithstanding all the economy used, were nearly gone; ammunition was scarce; he was hemmed in on every side; his horses and mules were nearly all dead; his artillery useless; and his feeble soldiers, pallid with fevers, hunger, and despair, seemed wholly incapable of making a last effort for safety. The maimed commander, the famished army, were objects of ridicule and almost pity to their triumphant enemies on Lookout Mountain and Missionary Ridge.

Why Bragg did not attack while his opponents were thus enfeebled can scarcely be imagined. He might, one would suppose, have swept them easily from their low ground with his superior forces. Perhaps the shadow of a great name held him in awe. Perhaps he shrank from coming down to meet the two renowned leaders on equal terms. But his opportunity was soon to slip from his grasp. Grant saw at once that his soldiers must have food. Three days after his arrival, on the 26th of October, a flotilla of sixty pontoon boats sailed in the dark and foggy night down the Tennessee. They were to seize the Lookout Valley, and strike the enemy in an unguarded point; Hooker co-operated with the bold movement; every link in the strategic sally was well preserved, and after a fierce battle with Longstreet at Wauhatchie the valley was won—the army was safe. Supplies at once poured in, and the baffled enemy saw with rage and amazement his blockade completely broken by a brilliant stroke of strategic skill. Grant's army was now gradually reinforced until it amounted to sixty thousand men. Hooker had brought ten thousand tried soldiers from the battle-fields of the Potomac, eager to prove their courage in a new campaign. Sherman was there with twenty thousand of his favorite troops; Thomas had thirty thousand. They were soldiers unsurpassed in any land; they were led by men who had no superiors in the art of war; and Grant, who knew their merits, now resolved to test them by an unprecedented effort. He proposed to charge the enemy on their mountains, to clamber up the precipitous sides of Lookout and Missionary Ridge, in the face of powerful intrenchments, long lines of artillery, the fire of countless muskets—to fight a battle of giants on the top of the Cumberland range.

Fortunately Bragg, secure in his powerful works and his inaccessible position, had never suspected that his opponent would venture upon so hopeless an attempt. He had even weakened his army by sending off a large force to aid in crushing Burnside, who was now hard pressed

in Eastern Tennessee. He had but forty-five thousand left, but he no doubt supposed that the advantages of his situation were a full compensation for the superior numbers of his foes. What commander, indeed, had ever dared to scale precipitous mountains and assail a great army on their tops? The attempt would be madness; a hundred men on Missionary Ridge seemed equal to a thousand on the plain below. Grant seized upon the fortunate moment and prepared to profit by the error of his adversary. Hooker was to scale the rough sides of Lookout, Sherman to attack the north extremity of Missionary Ridge, and Thomas, in the centre, to advance up the mountain to the heart of the enemy's defenses. On the morning of the 23d of November Thomas moved out of the Union lines at the head of twenty thousand men, and so little did the enemy look for any hostile movement that they gazed down with curiosity and admiration at the splendid array of the Union forces on the plain below, believing it to be nothing more than a morning parade. All around the magnificent amphitheatre of mountains and crags the rebel pickets leaned on their muskets and watched at ease the glittering host as it passed beyond its intrenchments. Suddenly the rattle of musketry roused them from their delusion. The Union force swept on to the enemy's first lines and captured all their defenses below Missionary Ridge. Sheridan was there, now for the first time fighting under Grant's eye; Thomas had planted himself firmly on the front; and although the cannon roared from the hostile heights, and sharp showers of musket-balls fell on either side, yet the Union forces intrenched themselves safely in the lines they had won, and that night slept on their arms, prepared for a wonderful achievement the next morning.

Meanwhile Sherman had led his forces along the opposite side of the river, hidden in a kind of ambush, had toiled through unlooked-for difficulties in that wild region, crossed safely over to the north side of Missionary Ridge, driven in the enemy's advance, and by the evening of the 24th had fixed himself firmly on the coveted position. A thick mist hid his movements in a friendly veil until his right had formed a connection with Howard's corps of the central army. Thus the Union forces on the morning of the 25th formed a connected line, of which the left extremity was intrenched on Missionary Ridge and threatened Bragg's right wing. But in the interval a wonderful contest had been going on along the declivities of Lookout Mountain. It was the Battle among the Clouds. Hooker on the 24th led out his forces from the Lookout Valley. He had ten thousand men, partly from the Army of the Potomac. It was their appointed part in the great drama to climb the precipitous sides of the Eagle's Nest, now defended by a force of seven thousand of the enemy, and to plant their flag upon its topmost peak; they performed it without a single repulse. The mountain is steep, thickly wooded, and broken by huge crags that project like bat-

tlements amidst the masses of rich foliage. Half-way up its side is a plateau of arable land which was defended by redans, rifle-pits, and all the resources of military art. Its peak shoots up a huge crest of rock, the favorite signal post of the enemy. Heavy mists hung around the mountain as the brave soldiers began to climb its sides; soon they were lost to sight from the plain below, and only the flash and rattle of musketry breaking through the clouds announced their gradual advance. At length Geary, who led the Potomac men, creeping over ledges and boulders, breaking their way through wild forests never trodden by human step, often under the muzzles of the enemy's guns, emerged on the plateau where the rebel intrenchments were strongest. A sharp battle at once began; the enemy were driven on all sides; and at length, about two o'clock, when a dense mass of clouds had enveloped the combatants in darkness, Hooker could announce to his commander that the mountain was won. Yet all night long the flashes of musketry glittered along the wild sides of Lookout, and the rebel signal-fires on the peak, which had not been occupied, were seen announcing to Bragg their danger and defeat. In the night they abandoned the mountain.

The next morning (the 25th) broke bright and cold, and the November sun shone over the mountains and the plain. Grant had ordered a general assault on Missionary Ridge. Before him rose the tall mountain range, on which could be seen, glittering in the sunlight, the bayonets of nearly fifty thousand practiced soldiers, trained in mountain warfare. In the centre was Bragg's head-quarters, along the crest of the hills ran lines of earth-works and felled trees; and the open mouths of thirty heavy cannon, besides lesser artillery, threatened death to the bold assailant who should attempt to climb the height. The Union army, the rebel works no longer hid in mist, came out in bold distinctness on that fair November day, and the two commanders watched each other's motions from their elevated stations, prepared for the final shock. Meantime at dawn Sherman's guns were heard on the northern side of the Ridge, and from daylight until noon that active leader was slowly pressing on along the mountains to cut Bragg off from his base of supplies at Chickamauga. He was as yet fighting the battle alone; for Hooker had not arrived to attack on the right, delayed by the rough roads, and the centre under Thomas had not stirred. Bragg about three o'clock weakened his centre by sending a large force to cut off Sherman. Grant saw the opportunity. Hooker was now coming up, and the commander, swift to seize his moment of attack, ordered a general charge up the hill. Never was there such a charge. The Army of the Cumberland, which had all day been chained behind its intrenchments like a dangerous mastiff, and had heard with impatience the bold advance of Sherman, now broke into a run up the steep

declivity, swept over intrenchments and rifle-pits, drove the frightened enemy out of their defenses, and with a wild shout followed them so closely that they had no time to pause. Sheridan, who led the way, looked back and saw a huge mass of bayonets glittering in the sunlight, and swelling like a wave up the mountain-side. Even he describes the spectacle as terrific. But to the enemy the charge was fatal. In vain they poured down a plunging fire from thirty cannon into the glittering sea of steel; in vain their musketry flashed from every side. The thick line of the Army of the Cumberland never wavered nor paused; where they could not run they climbed or crept; they refused to stop even at the command of their officers, and, moved by the instinct of victory, drove the enemy in wild flight before them to the very crest of the Ridge. Here they swept over the powerful intrenchments, shot down the gunners at their cannon, captured whole regiments of panic-stricken soldiers, and broke in six places those lines which had so long frowned upon them in the valley of the Eagle's Nest.

There was now victory all along the line. Hooker, Sherman, Thomas, had been successful. Bragg fled, leaving six thousand prisoners and all his guns, and was closely pursued by Sheridan and Sherman. The news of the great victory was flashed over the country; again the name of Grant was uttered with gratitude by every loyal tongue; thanksgiving was offered in the churches; and once more peace seemed near. Again Grant urged an immediate advance on Mobile, and again was rebuked for his imprudence. But the people now acknowledged their leader; they began to reflect upon Belmont and Paducah, Donelson, Shiloh, Vicksburg, Chattanooga, and they felt that a military genius had arisen who saw what other men could not see, and who possessed the intellect, force, and ingenuity necessary to carry out his own conceptions. The President sent Grant his honest congratulations; Congress voted him thanks; Burnside was saved; the cotton States lay open to the Union forces; and at length nothing remained of the rebellion but that central power which had so long ruled at Richmond, sustained by the military skill of Lee.

The contest now grew in epic interest as those two renowned commanders, who had been for three years giving battle successfully to their various opponents, and who had been almost equally victorious in every encounter, who were the acknowledged leaders of the North and the South, and on whose single prowess seemed to rest the decision of the dreadful struggle, approached each other and prepared for their last campaign. General Grant had been placed at the head of all the Union forces, and now directed the movements of an army of nearly one million of men. But from this number one-third must be subtracted for absences, sickness, and various other causes, leaving the whole number of Union forces on duty not far from

seven hundred thousand. Of these he had about one hundred and fifty thousand for offensive operations against General Lee at Richmond, besides the forces in Western Virginia and North Carolina. This immense army was well supplied with arms, food, and all the last improvements in the military art; it was admirably officered by Meade, Hancock, Warren, and Sedgwick. Sheridan commanded a fine body of ten thousand cavalry; and the army which General Grant led out from Washington in May, 1864, has scarcely been surpassed in efficiency by that of any commander in history. It was the magnificent result of the direction of all the energies of the people of the North to the art of war.

Lee, on the other hand, had but sixty thousand men. His soldiers were no doubt excellent, but he had no subordinate officers equal to Meade and Hancock, Sheridan and Sedgwick. He was probably limited in his supplies of the munitions of war, and the succession of disasters to the Confederate arms had thrown a shade of discouragement over those gallant spirits who still sustained with desperate courage their falling cause. Yet Lee had his own peculiar advantages. It is a well-known principle in warfare that an army within a range of fortifications is held to be capable of resisting a force greatly superior to itself for an unlimited period; indeed, the only mode of conquering an intrenched army, well-commanded, is by turning its flank and cutting off its supplies. But with so brilliant and daring a strategist as Lee this would necessarily prove a most difficult and hazardous operation, since he might at any moment choose his mode of attack, and direct all his strength against any weak point in the advancing line of his opponent. The country around Richmond, too, was well suited to conceal any sudden movement. It was in many places a thick wilderness, covered by almost impenetrable woods; in others protected by rivers, swamps, and morasses overgrown with wild vegetation. The Confederate leader was familiar with all the paths that led through this difficult country, and was prepared to strike his foe when he was least conscious of his danger; nor could any hostile army approach Richmond without being broken up by the nature of the ground into separate detachments, and exposed to the irresistible onset of an active assailant. Thus, while Grant had the advantage of superior numbers and greater resources, his opponent retained a certain superiority in his almost impregnable position. Richmond was, in fact, assailable only from the south, where lay its lines of supplies; and so long as these remained open it could defy any force that might attack it on any other side.

Grant's plan, therefore, from the first had been to cross the James River, and place himself below the hostile city; but before doing so he was desirous of inflicting some severe defeat upon Lee, in order to drive him into his intrenchments. He thought that by striking the

hostile army a succession of blows he might so weaken it as to prevent it from assuming the offensive in future, or of interfering effectually with the proposed siege. Viewed in this light the various battles that he delivered against Lee's army during the early part of the campaign had very important results; since, although attended with great loss to the Union army, they were in proportion far more injurious to the foe. Grant lost about 60,000, Lee 30,000; but the loss of the latter in comparison to his numbers was one-half, Grant's loss one-third of the disposable forces. Nor does the Union loss seem excessive when we consider the magnitude of the contest, or compare it with the waste of life in other wars. In the Dutch struggle for freedom Mr. Motley tells us that one hundred thousand men laid down their lives at a single siege. At Cannæ the Roman dead were estimated at sixty thousand. Napoleon's various campaigns were far more destructive. The Spanish Armada must have lost twenty thousand men. The army of the Potomac had but eight thousand killed, the rest of its loss being wounded or prisoners; and if we compare Grant's whole campaign with any one of Marlborough's, or with Wellington's Spanish exploits, we shall find that it was not marked by unusual loss—that it was comparatively merciful to friend and foe.

On the 4th of May, 1864, the army set out through Virginia for a final effort to conquer peace. Here, while embarrassed in the rough region known as the Wilderness, Lee struck it a severe blow—such as he had been accustomed to deliver with fatal success in his former campaigns. Now, however, although he inflicted a severe loss, his own was so considerable as to prevent him from checking the onward movement. Grant, with his usual perseverance, sought at once to turn his enemy's flank by advancing to Spottsylvania, and again a second battle took place, in which, owing to Hancock's brilliant charge, the loss on both sides was nearly equal. The Union army next moved to the North Anna, where it was once more repelled by the skillful movements of Lee; and Grant, still pursuing his design of turning the enemy, pressed on to Cold Harbor, where he made a general assault upon Lee's intrenchments, which was altogether unsuccessful. But the enemy was much enfeebled by his various and incessant efforts, and Grant seems to have felt that as his own army was now reinforced to its original numbers he was at liberty to choose his own point of attack. Thirty-seven days of fighting had passed since he had entered the Wilderness. After some repose, on the 14th of June the army began to cross the James.

It was the same strategy with which Grant had thrown himself below Vicksburg, in the heart of the enemy's country; had maintained himself at Corinth surrounded by foes; had pierced the grand strategic line at Donelson, or chained Columbus at Belmont. He at least saw that Richmond could only be captured from

the south; that so long as its lines of communication lay open it was only an intrenched camp, as impregnable as the heights of Torres Vedras. The plan was new and difficult of execution; the country looked on with doubt, and even alarm; some thought that Grant would be crushed by a sudden movement of his indomitable assailant, who had struck him severe blows at the Wilderness and Cold Harbor; some that Lee would seize the moment of his absence to march upon Washington and levy contributions on the prosperous North. But Grant knew that his enemy's resources were swiftly diminishing; that the late battles had already destroyed his capacity for offensive movements; that Richmond was badly supplied with provisions and stores; and that the time had come when the wisest policy was to sit down before the citadel of rebellion, and crush the rebel army, Government, President, nation, by the slow but fatal operations of the siege. Yet it was evident to all that it must be a prolonged one; for Grant was at first able only to draw his lines around a portion of his enemy's defenses. Singularly enough, to the north and west Richmond was never invested: there its bold leaders swept the valley with their active cavalry, and beat back the Union troops to the mountains; were often threatening Washington, and at one moment had nearly entered the hostile capital and driven its Administration into exile. It was almost a renewal of the siege of Troy, for wherever Grant was not Lee was certain to conquer; the modern but modest Hector ruled over the field triumphant unless opposed by a humane Achilles.

One striking trait in this bold plan was that it involved the siege of an army rather than a town. In all other investments of fortified towns the garrison has usually been far inferior to its assailants. Marlborough, in all his great achievements, never ventured to besiege an army. Napoleon, at Ulm, forced his enemy to a battle that proved decisive. But owing to Lee's fortunate situation, having various lines of access open to him, and possessing a force not much less than half that of his opponent, he was always enabled to threaten any single point in Grant's works with superior strength, and he was constantly assuming the offensive on the north side of Richmond, while his enemy was slowly and painfully turning his flank upon the south. A clear proof of the difficulty of the siege is seen in the affair of Petersburg. That important post had been left undefended until Grant had crossed the James River, but no sooner did he attempt to seize it than Lee, aided by the hesitation of several Union commanders, filled it with his best troops, beat back the assailants, and soon surrounded it with lines of earth-works that made it invulnerable to a sudden attack. Like Todleben at Sebastopol, Lee and his active engineers created a powerful fortress in the face of the foe. His numerous forces enabled him to retain a garrison at Richmond capable of repelling the Union troops

on the north, and yet to throw so large an army into Petersburg as to check the progress of his besieger. Grant was therefore compelled to extend his line far to the south of Richmond, and thus to offer a still feebler front to any united attack of his active foe.

Lee's intrenchments began at Chapin's Bluff on the James River, about ten miles below Richmond. From thence they extended, except where the river supplied their place, quite around to the west side of Petersburg; and here they were gradually advanced, as those of Grant made it necessary, until they had reached far on toward the Southside Railroad. His chief supplies came by the Weldon and Southside railroads, and it was for the possession of these that Grant was to struggle for more than nine months. The siege began on the 18th of June, 1864, and continued until April, 1865. Grant's important attacks were all made at the extreme western end of his line, where he constantly strove to turn the enemy's flank or to seize his railroads, and where various fierce battles took place in which Grant's army lost largely, but was still slowly enveloping its struggling foes. The Weldon Railroad was first seized after a severe contest; then the long chain of earth-works was pushed cautiously on toward the Southside; and then Grant lay quiet in the winter, after one or two apparently unsuccessful attacks, calmly improving his defenses and covering himself with impregnable earth-works. Meantime the nation grew weary of the slow movement of the siege, and could not understand why its immense army failed to crush its comparatively feeble foe. Curious visitors came trooping from the Northern cities to inspect Grant's admirable lines, and returned from their holiday excursion to wonder why so little was done; the summer had passed away, the autumn came, winter drove the troops into their comfortable camp; spring was near again, and yet nothing had been told except that Grant was building earth-works and that Lee was building opposite him. Both armies seemed contending only with their spades; why might they not build sand-hills opposite to each other forever?

Grant, however, saw that the moment had nearly come for the completion of his grand design. He had watched with fixed attention the last struggles of the falling Confederacy. Locked in his iron grasp its powerful frame had withered and slowly faded into weakness. Its last army, half fed and never paid, must soon abandon Richmond or surrender; Sheridan had swept the valley of Virginia, and rejoined his chief at Petersburg; Wilmington, from whence Lee had obtained his foreign supplies of food and arms, was fallen; the long lines of the besiegers were approaching the Southside Railroad, and when that fell the contest would be over. His chief fear now was that Lee would be able to escape from Richmond by some sudden flight, join Johnston's army in North Carolina, and thus, at the head of a hundred thou-

sand men, prolong the war in some distant quarter. At length, in the end of March, he wrote to Sheridan, "I wish to finish this thing," and a grand attack was made on the extreme end of the enemy's line. It was the decisive battle of the Five Forks. Sheridan struck the hostile force sent to protect the important point, and, aided by Warren, crushed a whole division of the enemy; the line was turned, the disaster was irreparable; and Lee felt that Richmond and Petersburg were no longer tenable. His only hope for the future was by a rapid flight to join his forces to those of Johnston. Meanwhile an assault had been made on Petersburg, and Wright, at the head of the famous Sixth Corps, broke through the strong intrenchments.

On Sunday morning, April 2, when the churches at Richmond were filled with worshippers, and Jefferson Davis was kneeling in his pew, a note was placed in his hand informing him of the great disaster. He left the church broken in spirit, if never before, to prepare for a hasty flight. The news soon spread, and the gay and hopeful city was filled with a terrible consternation. All was disorder, confusion, despair; the President, his Cabinet, and the army fled hastily from their capital; on every side were heard the explosion of arsenals and the crash of blazing buildings; robbers filled the streets and plundered the houses of the citizens; and Ewell set on fire the finest quarter of the town, and reduced the wealthiest portion of Richmond to ashes.

Meantime a wild chase was going on, in which the huntsman Grant pursued with relentless activity the flying forces of Lee. That able chief, never desponding, had obtained a start of twenty miles, with forty thousand men, and was moving rapidly along the north side of the Appomattox River, hoping to reach the Danville Railroad; Sheridan and Grant swept yet more rapidly along the south side, and soon began to cut off the stragglers and assail the rear of the luckless foe. Still Lee might have escaped had not the complete failure of his food forced him to pause to give his men rest, and checked him in his rapid flight. He was overtaken, and nothing remained but surrender. He yielded gracefully. The two great Generals met at the little hamlet of Appomattox Court House, and for the first time saw each other face to face; unless, perhaps, they had met before during the Mexican War, when Grant was a young lieutenant, promoted for courage, and Lee already a distinguished officer—the chief favorite of his commander. Grant consented to honorable terms; his labors were over, and peace had come.

And never was a peace more gladly welcomed than this. Grant and his gallant leaders had mourned, in the midst of their triumphs, the sufferings which a misguided faction had brought upon their common country, and to none was the gentle voice of Peace so sweet and welcome as to the heroes of the Great Rebellion.

A STREET ARAB.

RAGGED the jacket and trowsers he wears,
 Ragged the shoes on his feet;
 For shoe or jacket little he cares,
 This Arab of the street,
 "Pitching pennies" here in the Park
 Along with a noisy crowd,
 All of them ragged and dirty like him,
 Wrangling and shouting aloud.

I wonder whether he has a home,
 This ragged urchin, and how
 He earns the coppers he's tossing there
 With those other Arabs now;
 If mother or brother or sister has he,
 If ever a father he knew;
 If he sleeps in a bed like you and me,
 And eats as the rest of us do?

Scarcely human he seems, somehow,
 With his semi-savage shout,
 As he gives each nickel a curious toss,
 And capers wildly about.
 Yet the same God made him that made us all,
 The God that dwells above,
 Who watches even the sparrow's fall,
 In the fullness of His love.

All at once, as twelve o'clock draws near,
 Our Arab leaves his play,
 Gathers together what nickels are his,
 And suddenly darts away.
 A moment more and his shrill voice sounds,
 Shouting the news in the street,
 With fifty more, like a pack of hounds,
 Following close at his feet.

In and out of the cars he springs,
 He heeds neither hoofs nor wheels;
 His ragged feet seem gifted with wings,
 Like famous Mercury's heels;
 Now he stops a moment a paper to sell
 To some one passing by,
 Then away he goes on a rapid run,
 With a wild halloo and cry.

High up past the dizzy roofs his voice
 Ascends on its skyward way;
 A moving shadow he flits along
 In the garish light of day,
 'Twixt the rows of buildings on either side,
 With their windows, staring down
 Like so many giants, Argus-eyed,
 Sleeplessly watching the town.

I wonder if ever in thought he sees
 The rows of buildings fade,
 If ever in fancy he conjures up
 The desert without shade?
 If ever, winding before his sight,
 Long caravans appear,
 If the Bedouin chiefs of the sands he sees
 In himself and these others here?

For to me to-day as I stand in the Park,
 Watching them here at their play,
 Like a bright mirage, in the distance seen,
 Seem the buildings on Broadway;
 And I almost forget that this half-tamed boy,
 With the ragged shoes on his feet,
 Is not the scheik of some wandering tribe,
 But an Arab of the street.

A BRAVE LADY.

BY THE AUTHOR OF "JOHN HALIFAX, GENTLEMAN."

With Illustrations.

CHAPTER III.

AFTER this day the curate's family began painfully to recognize that they were really "poor" people.

Not that Mr. Scanlan's salary was small; indeed, the rector had been most liberal: but the real property of a family consists, not so much in what comes in, as in what goes out. Had they never been richer than now, no doubt they would have considered themselves tolerably well off, and have received smiling even the third little "encumbrance," which ere long made the cottage too busy and too noisy for Mr. Scanlan to "study" there with any sort of comfort. Not that he was fond of reading, or ever read very much; but he liked to have his books about him, especially the Greek and Latin ones: it "looked well," he said. He had come to Ditchley breathing a great aroma of classical learning, and he did not like it to die out: it gave him such an influence in the parish. So he was much annoyed to find that it was now difficult to keep up the appearance of a man of literature; for instance, his few books had daily to be cleared away that the family might dine upon his study-table—and though that rarely incommoded him personally, he being so often absent at dinner-hour—and invariably on "fast-days," as Bridget called them, she having been once a Catholic. She was not one now; having soon expressed her willingness to turn Protestant, or indeed any religion that Mrs. Scanlan chose: she wished to go to heaven with her

mistress, she said, and how she went, or by what road, was of no great consequence.

These "fast-days" were always made a joke of, by both her, her mistress, and the children, who were brought up to accept them as natural circumstances. But the truth was, the little family did not eat meat every day; they could not afford it. They always chose for their maigre days those days when Mr. Scanlan was out—which happened pretty frequently—for he had all the parochial visiting to do: the parish was large and the houses scattered. Moreover, he was so agreeable—had such a deal to say for himself, and such a pleasant Irish way of saying it, that every body was delighted to see him. His welcome from house to house was universal, and his invitations were endless. At first he used to refuse them, not liking to go any where without his wife; but when her accompanying him began to grow difficult, nay impossible, he refused less and less. The neighbors were so very pressing, he said, and he could not well offend his own parishioners. Gradually, as summer advanced, their eagerness for his society grew to that pass that he might have dined away from home every day in the week; in fact he often was absent three or four days out of the seven.

At first, I think, his young wife fretted a good deal about this. She did not care to have him stopping at home all day long; the children were a weariness and a trouble to him, for there was no nursery to hide them in; and besides, she could not do her duty properly to

them when he was there. Nor to him—as she often vexed herself with thinking—when they, poor little pets! were always wanting her, and always in the way. But she would have preferred to see her husband come regularly home of evenings. She would have liked to sit and watch for him across the common at a certain fixed hour; to have known that—punctual as the sun—he would have come in and shone upon her; her sunrising being at the ordinary sunsetting—the close of the day. It would have been good for her, and sweet to her, she knew, if, though he disliked to be troubled and worried—and she should always avoid that—he had taken a kindly, husbandly interest in things at home. It would have helped her, and made her strong, braver, and fresher to bear the thousand little household burdens, that are, in the total, so heavy—men have little idea how heavy!—upon women's weak shoulders. Especially young women—who have yet to learn how God fits the back to the burden, and how He never suffers the brave heart to fail, however tottering may be the feeble knees.

But Mr. Scanlan did not seem to understand these little difficulties of his wife. He was very kind, very affectionate; but it never occurred to him that she, being young and inexperienced, needed help as well as love, shelter as well as sunshine. He was very good when all was smooth and bright, but when any temporary cloud came over Wren's Nest, as clouds will come—slight sicknesses of the children, or small domestic cares of any kind—he just slipped away, and left her to bear the brunt of the battle. True, when he reappeared, he overwhelmed her with praise for having borne it so exceedingly well; which was most pleasant to his wife's heart—so pleasant that it seldom occurred to her till afterward that the battle might have been easier had she not been left to fight it single-handed.

Still, a husband at home all day is a great nuisance, especially with a young family; and she was not always sorry for Mr. Scanlan's absence, particularly at dinner-time. Women can put up with so many things that are intolerable to men. When butcher's meat ran short, Bridget developed quite a genius for puddings, which delighted the children amazingly. And then their mother tried her delicate hand at various French cookeries which she remembered out of "the days of her youth," as she began to call them now, and especially the *potau-feu*, which her mother used to see when, as the young demoiselle of the château, she was taken by her nurse to visit old Norman cottages. She loved to tell about this wonderful Normandy to her little César, who listened eagerly, with the precocity not rare in eldest children, when the circumstances of the household compel them to the lot—often a most happy one—of being constantly under the mother's eye, and constituted the mother's principal companion.

These details I take from the Saturday night's

journal, which Mrs. Scanlan kept so scrupulously and for so many years. It was, as I have said, written in French, her fondly-remembered native tongue, but it was not at all French in its style, being quite free from that sentimental exaggeration of feeling which makes French journals and letters of the last century or half-century seem so queer and affected to our British undemonstrativeness. Hers was as plain, as accurate, as if she had been the "thorough Englishwoman"—into which, as their summit of well-meant praise, her neighbors told her she was growing. She records the fact, but makes no comment thereon.

Nor will I. I believe firmly in the science of anthropology; that you might as well expect to evolve certain qualities out of certain races, as to grow a rose out of a tulip; but you can modify both rose and tulip to an almost infinite extent, cultivating their good points, and repressing their bad ones; and to quarrel with a tulip because it is not a rose is certainly an act of supreme folly, even though one may like the rose far better. I myself own to having a warm love for roses, and a strong aversion to tulips; yet when a certain great and good man once took me to his favorite tulip-bed, and dilated on its merits, exhibiting with delighted admiration the different sorts of blooms, I felt tempted to say within myself, Can I have been mistaken? is a tulip a desirable, not a detestable, flower after all? And I was such a tender hypocrite to my old friend that I had not the courage to confess I had detested tulips all my life, but meant henceforward to have a kindly feeling toward them—for his sake.

So those of my readers who hate French people and Irish people, with their national characteristics—may be a little lenient to both, as they read on farther in this story.

Mrs. Scanlan's neighbors, though they did pay her these doubtful compliments as to her foreign extraction, were very kind and neighborly. They admired her without being envious of her, for indeed there was no need. She came into competition with none of them. The young ladies, unto whom her beauty might have made her a sore rival, were quite safe—she was already married. The matrons, with whom she might otherwise have contested social distinction, were also secure—she never gave entertainments, and competed for the queenship of society with no one. The one field in which, had she fought, she must certainly have come off victorious, there being no lady for miles round who was her equal in qualities which I think are more French than English—in the gifts of being a good talker, a better listener; of making people comfortable together without knowing why; and of always looking so sweet and pleasant and pleased with every thing that all people were perforce pleased, both with themselves and her—from that grand arena Mrs. Scanlan retired; and so soon that nobody had time to dislike her for succeeding in it.

She had another quality which made her

popular at Ditchley—she always sympathized with her neighbors, and interested herself warmly in their affairs, without ever troubling them with her own. I remember a certain line out of a once popular ballad, which then struck me as a very unfair balance of things, but which I have since recognized as the easiest and safest plan after all, with regard to all but the one or two intimate friends that one makes in a lifetime—

“So let us hope the future as the past has been
will be,
I will share with thee thy sorrows, and thou thy
joys with me.”

It illustrates exactly the unconscious creed and daily practice of Josephine Scanlan.

Thus, narrow-minded as Ditchley was in some things—as all country towns necessarily must be, and were then, before the era of railways, much more so than now—it had a warm heart, and kept the warmest side of it to the curate’s wife, a stranger though she was. Of her small outside world Mrs. Scanlan had nothing to complain. It may have criticised her pretty freely; very likely it did; but the criticisms fell harmless. She never heard them, or if she had heard, would not have heeded. She was so entirely free from ill-nature herself that she never suspected it in others. If people talked about her, what harm did it do her? She was very sure they never said any thing unkind.

And, strange to relate, I believe they never did. She was so entirely simple and straightforward—ay, from the first day when she explained, quite unhesitatingly, the dire mystery which had agitated Ditchley for weeks, the Scanlan and Co. porter-bottle!—that spite laid down its arrows unused, meanness shrank ashamed into its own dark corners, and even malice retired abashed before the innocent brightness of her unconscious face.

“Every body likes me,” she said of herself at this time. “I really don’t know why they do it, but I am sure they do. And I am so glad. It is such a comfort to me.”

Was she beginning to need comfort—outside comfort—even already?

Her outside gayety was certainly ceasing by slow degrees. She was invited as usual, with her husband; but gradually it came to be an understood thing that Mr. Scanlan went and Mrs. Scanlan remained at home. “She could not leave the baby,” was at first a valid and generally accepted excuse, and by the time it ceased to be available her absence had become such a matter of habit that nobody wondered at it. For a while the “every body” who liked her so much missed her a little, and even remonstrated with her as to whether she was not sacrificing herself too much to her family, and whether she was not afraid of making Mr. Scanlan angry in thus letting him go out alone. “Oh no!” she would reply, with a faint smile, “my husband is not at all angry. He quite understands the state of the case.”

He did understand, after his fashion—that

is, he presently discovered that it is somewhat inconvenient to take into society a wife who has no carriage to go out in, but must spoil her elegant attire by walking. Or still worse, who has no elegant attire at all, and wherever she appears is sure to be dressed more plainly than any lady in the room.

It may seem ridiculously small, but the subject of clothes was now growing one of the burdens of Mrs. Scanlan’s life. She had never thought much of dress before her marriage, and afterward her rich toilet had been accepted by her both pleasantly and naturally. Every body about her dressed well, and so did she, for her husband liked it. Fortunately her good clothes were so many that they lasted long after her good days—that is to say, her rich days—were done.

But now the purple and fine linen began to come to an end, and were hopeless of replacement. The first time she went to Ditchley to buy herself a new dress, which her husband declared she must have, she was horrified to find that a gown like one of her old worn-out ones would involve the sacrifice of two months’ income to the little household at Wren’s Nest. So her dream of a new silk dress vanished: she brought home a muslin one, to the extreme indignation of Mr. Scanlan.

Poor man! he could not understand why clothes should wear out, and as little why they should not be perpetually renewed. He had never seen his mother dress shabbily—why should his wife do so? His wife, upon whom his credit rested. If she had only herself to consider it would not have signified; but a married lady—the Reverend Edward Scanlan’s wife—was quite another thing. He could not see the reason for it: she must be learning slatternly ways; yielding to matronly untidiness, as he saw young mothers sometimes do—which he always thought a great shame, and a great unkindness to the husband. Which arguments were perfectly true in the main, and Josephine recognized the fact. Yet the last one went rather sharply into the young matron’s heart.

She changed her style of dress altogether. Her costly but no longer fresh silks and satins were put away—indeed, they fell away of themselves, having been remodeled and altered to the last extremity of even French feminine ingenuity. She now appeared almost exclusively in cotton print of a morning, in white dimity of an afternoon: dresses which Bridget could wash endlessly, and which each week looked fresh and new again. Her children the same. She could not give them a clean frock every day, as their father wished—every other child he saw had always a clean frock on, and why not his children?—but she dressed them in neat blue-spotted pinafores—blouses she called them—the familiar French name—with a plain leather belt round the waist—and they looked so pretty, so very pretty!—or she and Bridget thought so many a time.

It is a curious and sad indication of how

things changed after the first sunshiny summer at Wren's Nest, that the mistress and servant seemed to have settled their domestic affairs together, and shared their domestic griefs and joys, very much more than the mistress and master. Whenever there was a sacrifice to be made, or a vexation or fatigue to be endured, it was they who suffered—any how, *not* Mr. Scanlan. Mrs. Scanlan contrived to shield her husband—almost as she did her little children—from any household perplexity or calamity, and especially from a certain dim sound heard in the distance, every day approaching nearer and nearer—the howling of that blatant beast, “the wolf at the door.”

“Hardships are so much worse to him than to me,” she would reason. “With me it is but just going back to old times, when I lived at home with my father—and we were so very poor—and so very happy too, I think—whereas with my husband it is different. He has been rolling in money all his life—poor Edward!”

No doubt this was true. Nor do I wish to judge the curate more harshly than his wife judged him. Besides, people are variously constituted; their ideals of happiness are different. I can imagine that when Josephine Scanlan sat in front of her neat cottage—with César and Adrienne playing at her feet, and her baby-boy asleep on her lap—sewing hard, for she had never done sewing—yet stopping a minute now and then to refresh her eyes with the sweet landscape—green, low hills, smooth and sunny, which shut out the not very distant sea, beyond which lay *la belle France*, which she had always dreamed of, but never beheld—I can imagine, I say, that it mattered very little to Josephine Scanlan whether she lived in a great house or a small one; whether she went clad in satin and velvet, or in the common dimity gown, which Bridget often sat up half the night to wash and iron for Sundays, and in which, as she went to church with a child in either hand, poor Bridget declared, the mistress looked “like an angel just dropped from the sky.”

Whether the rest of the congregation were of that opinion can not now be discovered. They still paid occasional visits to Wren's Nest, stopping in carriage-and-pair at the garden-gate, and causing Bridget a world of flurry to get a clean apron and smooth her hair before rushing to open it. But it is a very different thing, paying visits in a carriage after an idle morning, and paying them on foot after a morning's hard work in arranging the house affairs and looking after the children. Mrs. Scanlan had to explain this—which she did very simply—to such of her husband's parishioners as were specially kind to her, and with whom she would have liked to associate, had fate allowed. Her excuses were readily and graciously accepted; but, after a time, the natural results of such an unequal balance of things ensued. Her visitors became fewer and fewer: sometimes, in winter,

whole weeks passed without a single foot crossing the threshold of Wren's Nest.

Necessarily, too, there came a decline in other branches of parish duty that Mr. Scanlan considered essential, and urged his wife to keep up; which she did at first to the utmost of her power—Dorcas societies, district visiting, village school-feasts, and so on; various forms of benevolence which had lain dormant until the young curate came. Ditchley, having a very small number of poor, and abounding in wealthy families with nothing to do, soon found charity a charming amusement; and the different schemes which the new clergyman started for its administration made him very popular.

But with Mrs. Scanlan the case was different.

“I can't sit making clothes for little negroes, and let my own children run ragged,” said she once, smiling: and arguing half in earnest, half in jest—for she found that the latter often answered best—with her husband, who had been sharply reproving her. “And, Edward, it is rather hard to sit smilingly distributing fuel and blankets to the ‘believing poor,’ as you call them, when I remember how thinly-covered is poor Bridget's bed, and how empty our own coal-cellar. Still, I will do my best, since you wish it.”

“Do so—there's a dear girl!” replied he, carelessly kissing her. “Charity looks so well in a clergyman and a clergyman's wife. And, besides, giving to the poor is lending to the Lord.”

Mrs. Scanlan cast a keen glance at her husband—she always did when he said these sort of things. She had begun to wonder how much they meant—at least how much he meant by them, and whether he really considered their meaning at all. I am afraid, for a clergyman's wife, she was not as religious a woman as she ought to have been; but she had had too much of religion when she lived in Merriam Square. In that particular set to which her husband belonged its cant phraseology had been painfully dinned into her ears. She recognized all the intrinsic goodness of the Evangelical sect, their sincere and earnest piety; but she often wished they could do without a set of stock phrases—such as Edward Scanlan had just used—which gradually came to fall on her ear as mere words, implying nothing.

“Lending to the Lord!” said she. “I wish He would begin to pay me back a little that He owes me.” “I wish He would send me a new pair of shoes for each of the children. They want them badly enough.”

At which Mr. Scanlan looked horrified, especially as this unfortunate speech had been made in presence of his rector, Mr. Oldham, who had just come in for a call. Possibly he did not hear, being very deaf, and using his deafness sometimes both conveniently and cleverly.

He was the one visitor whose visits never ceased, and were always welcome; for they caused no inconvenience. If the mother were busy, he would be quite content to talk to the

children; who liked him well enough, though they were a little afraid of him, chiefly through their father's always impressing upon them that they must behave so exceedingly well when they went to the Rectory, which was now almost the only house in the neighborhood they did go to. At first, when César and Adrienne had acquired sufficiently walking capabilities and good manners, their father amused himself by taking them about with him pretty often; but being not angels, only children, they sometimes vexed him considerably. They would get tired and cross; or, from the great contrast of living at home and abroad, they would be tempted—poor little souls—to overeat themselves, which naturally annoyed the curate much. By degrees both they and their mother found that going out with papa was not unmixed felicity; so that when the habit was given up it was a relief to all parties.

Gradually the parents and children seldom appeared in public all together, except when they were invited to the Rectory—as they had been lately—to enjoy a strawberry feast, in the garden of which its owner was so justly proud.

"I am glad you approve of my roses," said Mr. Oldham, when, with a half deprecating, half threatening look at his wife, lest she should make some other unlucky observation, Mr. Scanlan had disappeared on important parish business. "I often think, Madame"—(he changed his old-fashioned "Madam" into Madame, out of compliment to her birth, and because he liked to air his French a little)—"I think my garden is to me what your children are to you. I only hope it may be equally flourishing, and may reward me as well for all my care."

The rector was sitting in the porch, his stick between his knees—he always wore breeches, gaiters, a long coat, and a large clerical hat—watching César, who was pulling up weeds in the somewhat neglected borders in front of the garden, but doing laborer's work with the air and mien of a young nobleman in disguise—a real Vicomte de Bougainville. One does see these anomalies sometimes, though I grant not often; poor gentlefolks' children are prone to sink to the level of the ordinary poor; but Josephine had taken great pains in the up-bringing of hers. As her eyes followed the direction of Mr. Oldham's, and then both their eyes met, there was in one countenance a touch of envy, in the other of pity—which accounted for his frequent visits and the kindly welcome which she always gave him.

That is, of late years. At first Mrs. Scanlan had been rather shy of her husband's rector, perhaps like the children, because her husband always impressed upon her the importance of being civil to him. Not until she found this needless—that the little old bachelor exacted nothing from her, and that, moreover, there was nothing to be got out of him—did Josephine become as friendly with Mr. Oldham as she was with her other neighbors. Her cold-

ness seemed rather to amuse him; nor did he ever take offense at it. He admired openly her beauty, her breeding, her good sense; and with his own pedigree, a yard long, hanging up in his hall, it is probable that he did not think the less of his curate's wife for being descended from so many noble De Bougainvilles.

What the old rector thought of his curate people never quite discovered. He kept his opinion to himself. When the parish went crazy about Mr. Scanlan, his beautiful sermons, his many accomplishments, Mr. Oldham listened, silent; when, as years ran on, a few holes were picked in the curate's coat, he listened, equally silent. But he himself always treated Mr. Scanlan with pointed respect, courtesy, and consideration.

He sat watching the children—there were four now, "baby" being exalted into Louis, and another little white bundle lying across Mrs. Scanlan's lap, as she sat busy at her ceaseless needle even while she conversed with her guest.

"Another girl, I understand, for I am to have the pleasure of christening her next Sunday. Are you offended with me, Madame, for declining to be godfather? As you are aware, your husband asked me."

She was not aware, and would have disliked it extremely; but she would not betray either fact, and therefore only smiled.

"What do you mean to do with your eldest son?" pointing to César. "As I was saying to his father, it is high time he went to school. But Scanlan tells me he prefers teaching him himself."

"Yes," said Josephine, briefly, for her visitor had touched upon a sore point. In early days her husband had been very proud of his "son and heir," who was a fine little fellow, the image of the grandfather whose name he bore—for all the children had French names, Mr. Scanlan not caring to perpetuate the Dennises and Judiths of his ancestry. He had insisted on educating César himself—who could so well teach a boy as his own father? Only, unfortunately, the father had no aptitude for teaching, was extremely desultory in his ways, and, as he gave the lessons chiefly for his own amusement, took them up and relinquished them whenever it suited him. Consequently, things went hard with little César. He was a bright, bold, noble lad, but he was not particularly clever nor overfond of his book. Difficulties ensued. Not that Edward Scanlan was one of your brutal fathers: he never lifted his hand to strike his son—I should have liked to have seen the mother's face if he had!—but he made her perpetually anxious and restless, because "papa and César did not get on together," and because, in spite of papa's classical acquirements, her big boy, the pride of her heart, was growing up a great dunce.

Yet when she suggested sending him to school, Mr. Scanlan had opened eyes of the widest astonishment. What necessity was

there? when he could teach him himself at home. Besides, how could they possibly afford the expense of schooling, when only lately she had told him, the father of the family, that he must do without a suit of new clothes for another six months? Differences ensued, which ended in César's remaining another year at home, while his mother learned Latin in order to teach him herself. And, somehow or other, his father appeared at the next visitation in a bran-new suit of best London-made clerical clothes, dined with the Archbishop, and preached a sermon on the text of "Charity suffereth long and is kind;" which was so much admired that he came home covered with glory, and, except that it was, fortunately, extempore, would have gone to the expense of printing and publishing it immediately.

Thus, when Mr. Oldham spoke, Josephine replied with that quick "Yes," and over her face came the shadow which he, who had all the quick observation which often belongs to deaf people, detected at once, and changed the conversation.

"I have my newly-married cousin, Lady Emma Lascelles, coming with her husband to dine with me on Thursday; will you come too? I asked Mr. Scanlan, and he accepted immediately."

"Oh yes, of course he will be most happy."

"I should like you to meet Lady Emma," pursued the old gentleman; "she was a nice little girl, and I dare say has grown up a sweet young woman. She will be sure to take to you—I mean, you will suit her better than most of the ladies of Ditchley."

"Indeed!" said the curate's wife, smiling.

"You see they will all stand in such awe of her"—and there was a slight satirical expression on the rector's thin mouth. "It is not often a 'lady' in her own right comes our way. Though the most innocent eagle that ever was, Emma will flutter our dove-cote, even as Coriolanus 'fluttered the Volscies in Corioli.' You will see!"

"Shall I? No; I fear I shall not. I am sorry to decline your kindness, Mr. Oldham, but you know I never go out now. I have not been at a dinner-party for years."

"So your husband said; but he said also that meeting Lady Emma was an exceptional case, and that I was to persuade you to go, as he wished it extremely."

"Did he? did he really?" said Josephine, with a sudden glow of pleasure; she had not grown quite insensible to the amusements of life, still less to that keenest enjoyment of them—to a wife—the consciousness that her husband likes to enjoy them with her; that he is proud of her, and admires her himself, besides having a natural satisfaction in seeing other people admire her too. But scarcely had she spoken than the glow faded. "I think you must have mistaken him, Mr. Oldham. My husband knows very well I do not visit. Indeed, I can not do it." ‡

"Why not?"

The rector was a daring man to put the question, but he had often wished to get an answer to it. Observant as he was, his observation only went a certain length; and intimate as Mrs. Scanlan now was with him, her intimacy had its limits too. So neat was Wren's Nest whenever he called, so great was its mistress's feminine ingenuity in keeping in the back-ground all painful indications of poverty, that the rich man, who had been rich all his days, never guessed but that his curate was exceedingly comfortable in his circumstances, indeed, rather well off for a curate. Thus, when he asked "Why not?" he had no idea that he was putting any painful or intrusive question, or saying any thing beyond an innocent joke, which, as an old man and a clergyman, he might well venture. When he saw Mrs. Scanlan look grave and troubled he drew back immediately.

"I beg your pardon. Pray, do not answer me."

"No; I think I had rather answer, once for all," said she, after a pause. "It is but honest, and it will prevent your thinking me ungrateful or rude. I have given up visiting, because, in truth, we can not afford it."

"I am aware, Madame," said Mr. Oldham, "that fate, which has given you almost every thing else, has denied you riches; but I think that should not affect you socially—certainly not in the visits with which you honor my house. Let me hope still to see you on Thursday."

"I can not," she said, uneasily; then laughing and blushing, "If there were no other, there is one very ridiculous reason. This is a grand bridal party, and I have no suitable clothes!"

"Why not come as you are? This is white," touching, half reverentially, half paternally, her dimity dress. "Would not this do?"

She shook her head. "I should not mind it; if I were dressed ever so plainly I should like to come. But—my husband—"

She stopped, for the same slightly satirical expression crossed the old man's mouth.

"I have no doubt my friend Scanlan has perfect taste; and, being an old bachelor, I can not be expected to understand how husbands feel on the subject of their wives' dress. Still, if I had a wife, and she looked as charming as Madame looks at this moment, whatever her costume might be, I should— But we will not further discuss the subject. Thursday is a good way off; before then I shall hope to bring you or your husband, or both, round to my opinion. May I go into the house, Mrs. Scanlan? for it is growing rather chill outside for an old man like me."

He went in, and sat an hour or more with her and the children; but, though he talked on indifferent subjects, and asked no further questions, she could see his sharp eyes wandering here, there, and every where, as if a new light

had broken in upon him, and he was anxious to discover every thing he could respecting the internal economy of Wren's Nest. Such a shabby little nest as it was now growing! with carpets wearing threadbare and curtains all darned, and furniture which had to be kept neat and pretty by every conceivable device—all those things which a woman's eye at once discovers, a man's never, unless they are brought pointedly to his notice, or his attention is awakened so that he begins to hunt them out for himself.

Mr. Oldham talked a good deal, and looked about him a good deal more; but not a syllable said he with reference to the matter which, the moment she had referred to it, Josephine could have bit her tongue off for doing so. Not that she was ashamed of her poverty, in itself—she had been brought up in too lofty a school for that—but she was ashamed of the shame her husband felt concerning it. And any thing like a betrayal of it before his patron would have seemed like begging for an increase of income, which she knew Mr. Scanlan desired, and thought his just due, and which every half-year she had some difficulty to keep him from applying for.

Therefore it was a real relief to Josephine when the rector said not a word more of the dinner-party, until, just as he was leaving, he observed, "By-the-by, I quite forget, I had come to consult you upon whom I should invite to meet Lady Emma."

"Me!"

"Who so fitting? Are you not hand-in-glove with all our neighbors? Do they not come to you for advice and sympathy on all occasions? Is there a birth or a death or a wedding in the parish that you don't know all about before it happens?"

"It used to be so," she said, half amused, half sadly; "and if not now, perhaps it is my fault. But tell me whom you mean to invite. I should like to hear all about the entertainment, though I do not go. It is such an important event in Ditchley, a dinner-party at the Rectory, and to a young bride."

So she took pencil and paper, and made out a list of names, he dictating them—for the old man seemed quite pleased with his little outburst of hospitality—until they came to one at which Mrs. Scanlan stopped.

"Dr. and Mrs. Waters. No; that will be useless. She—she does not go out."

"Bless my soul, I had forgotten. How stupid of me!" cried Mr. Oldham; and then he too stopped, and his keen, inquisitive eyes sought Josephine's. But she had dropped them, and was making idle marks upon the paper, to hide a certain awkwardness. They had both evidently hit upon a subject in which each was uncertain how much the other knew.

"I ought not to have forgotten. My good old friend! Of course, I must ask him; and—his wife."

"You had better ask him without his wife,"

said Josephine, quietly, with her eyes still cast down. "If you ask her, and she hears of it, she is sure to want to come; and—she ought not to come."

"I suppose not. Poor Mrs. Waters! she is—ahem!—a great invalid."

Mrs. Scanlan was silent.

"I thought," said the rector, clearing his throat, "that my poor old friend and I had arranged all between us, so that nobody in Ditchley was any the wiser for this—this sad affair. I hate gossip, and gossip about such a painful thing would be hard to bear. Waters and I took every precaution, and his house is a large house, and quite out of the town; one would have thought a person could be—ill—there without the whole town's knowing."

"I am not aware that the town does know; I hardly see how it can," said Josephine, gently, for she saw how troubled the rector was. She well knew why, only she had not expected so much warm feeling in the cold-mannered, lonely old man, who was supposed to care for nobody but himself.

"But *you* know?" said he, anxiously. "Yes, from your face now I am sure of it. Tell me frankly, how much do you know?"

"Every thing, I believe. I found it out by accident."

"How long since?"

"Six months ago."

"And you have never told—not a creature? And in the many times that I have spoken to you about the Waters family, you have never once betrayed that you knew any thing? Well, you are a wonderful woman—the only woman I ever knew who could hold her tongue."

"Am I?" said Josephine, smiling, half sadly, for she had had a few sharp lessons—conjugal and domestic—before arriving at that height of perfection.

Still anxious, Mr. Oldham begged she would tell him exactly what she knew, and there came out one of those terrible domestic tragedies, which people always hide if they can, and which had hitherto been successfully hidden, even from gossiping Ditchley. Dr. Waters's wife, of whom he was very fond, had suddenly gone mad, and tried to destroy both him and herself. The fit over without harm, she had partially recovered, but still required to be kept in strict seclusion as a "great invalid," appearing little outside her own house, and then only with her so-called "nurse"—in reality her keeper. This woman, once meeting Mrs. Scanlan when she had lost her mistress on the common, and was frantically searching for her, had betrayed the whole sad truth, imploring her to keep the secret, which she did faithfully.

"Even from your husband?" inquired, rather pointedly, Mr. Oldham.

"Yes. It did not affect him, nor would he have taken much interest in the matter," she answered, half apologetically. She could not say the other fact—that he would have told it the next day, quite unwittingly, to every body

A REMARKABLE WOMAN.

in Ditchley. "Besides, I had promised, and a promise ought to be kept implicitly."

"Certainly, my dear Madame, certainly!"

The old man sat rubbing his hands, and looking at her with great admiration. "A remarkable woman—the most remarkable woman I ever knew!" Then, as a knock came to the door, "There is Scanlan coming home to his tea, and I must go to my dinner. I will just shake hands with him, and depart. Adieu, Madame. Au revoir."

He bowed over her hand—his quaint, formal little bow—and disappeared.

But the next day Mrs. Scanlan received by coach, from the largest linen-draper's shop in the county town, a magnificent silk dress, richer than any thing ever seen in Ditchley. With it was an envelope, addressed to herself, containing these lines, written in French, and in the delicate, precise hand which was at once recognizable: "From an old man, in token of his respect for a lady who can both keep a promise and hold her tongue about it."

Alas! by this time there was no need for Mrs. Scanlan to hold her tongue any longer. Mrs. Waters had had another "attack," during which she had gone—Ditchley never quite knew how—to that world where she would wake up in her right mind, and heaven would be as tender over her as her dearly-loved and loving husband was, to the last, in this.

There was no dinner-party at which to show off the beautiful new gown; the rector was too shocked and sad to give any. But Lady Emma

came, and Mrs. Scanlan saw her, greatly to Mr. Scanlan's delight. Nay, the bride praised so warmly his Josephine that he admired her himself more than ever, for at least ten days, and took great interest in the handsome appearance she would make in her new silk dress. But Mrs. Scanlan herself had little pleasure in it, and, though she thanked the rector for it, and accepted it kindly—as, indeed, the kindness of the gift deserved—she laid it by in a drawer, almost as sadly as if it had been a mourning weed.

CHAPTER IV.

ON Josephine Scanlan's lovely face a slight shadow was now deepening every year and with every child—for a child came almost every year. Fortunately—or at least so said the neighbors—but did the mother?—fortunately, not all were living; but ere ten years were past Wren's Nest contained six little nestlings, growing up from babies into big boys and girls—César, Adrienne, Louis, Gabrielle, Martin, Catherine. Josephine had insisted on this latter name, in remembrance of her gentle, kindly, vulgar, good old mother-in-law, now long gone to her rest. Curiously enough, except Adrienne, who was the plain one of the family, but, as if by tender compensation, the sweetest little soul among them all, the whole of the children were De Bougainvilles—handsome, well-grown, graceful; a young tribe that any mother might be proud

of. And she was very proud of them, and very happy in them, at times—yet still the shadow in her face grew and grew.

There is a portrait of her, taken about this time, I believe, by a wandering artist who had settled for the summer at Ditchley, and with whom the curate struck up one of his sudden friendships. Mr. Summerhayes, attracted by Mrs. Scanlan's beauty, requested permission to paint her, and afterward, out of politeness, painted, as a companion picture, her husband likewise.

The two heads are very characteristic. The one is full of a lovely gravity, nay, something more, for the expression is anxious even to severity; in the other is that careless *insouciance* which may be charming in itself, but which has the result of creating in other people its very opposite. That painful earnestness about great things and small, that unnatural and exaggerated "taking thought for the morrow," which sometimes grows to be an actual misfortune, so as to make the misery of to-day—might never have come to Josephine, if her Edward had been blessed with a little more of these qualities. There is no need to do more than look at the two portraits, speaking so plainly through the silence of years, in order to detect at once the secret of their married life; how that the burden which the man shirked and shrunk from the woman had to take up and bear. Josephine Scanlan did this, and did it to the end.

Without murmuring either, except, perhaps, just at the first. There might have been a season when, like most young wives and many-childed mothers, she had expected to be cherished and taken care of; to be protected as well as loved; helped as well as admired; but that time had passed by. Not without a struggle; still it did pass, and she accepted her destiny; accepted it as a fact; nay, more, as a natural necessity. She was young and strong; physically, quite as strong as her husband, delicate though her appearance was; morally, no person who was in their company for an hour could have doubted the relative calibre of Mr. and Mrs. Scanlan. A man is not necessarily "a man," in the true spiritual sense, because he happens to wear coat and trowsers; nor is a woman always of the "weaker sex" because she has a soft voice, a quiet manner, a feeble and feminine frame. I have seen many and many a couple in which, without any great external show of the thing, Nature seemed to have adapted herself to circumstances, and "turned the tables" in a most wonderful way between husbands and wives, giving to the one wherewithal to supply the other's lack; and that so gradually, so imperceptibly, that they themselves scarcely recognized how completely they had changed places—the man becoming the woman, and the woman the man. A sad sight, theoretically: but, practically, often not so sad as it seems.

Possibly Mrs. Scanlan grew to be dimly conscious of one fact as concerned herself and her

husband—that, whether or not she was the cleverer, he being always considered such a brilliant and talented young man—she was certainly the stronger, wiser, more sensible of the two. But at any rate she experienced its results, and accepted them, and the additional duties they involved, with a great, silent courage, such as the urgency of the case demanded. For she was a mother, and mothers must never know either despondency or fear.

If she began to look anxious and care-worn, so care-worn that it spoiled her beauty and made her husband gradually become indifferent to whatever sort of dress she wore, it was no wonder. The mere thought of her children was enough to weigh her down night and day; to say nothing of the incessant physical weariness of taking care of so many little folk, bright, loving, mischievous monkeys, who had all the activity of healthy, country-bred children, placed under the very simplest discipline, and a discipline that was, of necessity, wholly maternal; for the father took less and less notice of them every day.

She did not spoil them, I think—at least Bridget protested she never did; that she always kept a wholesome authority over them, and never indulged them in any way. Poor little souls! there was small opportunity for indulgence in their primitive, all but penurious life; but she was obliged to see them growing up around her almost as wild as young colts; deprived of every advantage which good food, good clothes, good society, and, above all, good education, give to young people; that unconscious influence of outward things, which affects children, even at that early age, far more than we suspect.

Their mother saw all this; knew all that they lacked—which she would have given any thing to provide them with. Yet here she was, bound hand and foot with the iron bands of poverty; able to do almost nothing for them, except love them. She did that. God only knows how a mother's heart goes out to her children—with a perfect torrent of passionate devotedness—when in its other channel, deepest and holiest of all, the natural stream is slowly drying up; or becoming, as Wordsworth mournfully sings of it, no longer a living fountain, but

"A comfortless and hidden well."

I have no right to take any thing for granted—but straws show which way the wind blows—and I find in Mrs. Scanlan's journal, hidden under its safe French, many a sentence such as this, which betrays a good deal more than appears on the surface:

"My poor Adrienne is ailing, which casts a gloom over the whole house, and makes me busier than ever; for she has grown to be such a help to her mother, dear child! I wish I could take her to the sea, if only for a week; but how could I leave home—leave papa all to himself? Things would be sure to go wrong if I did; and besides, Edward would be so very

uncomfortable. Nor should I like to propose it; for it would cost a deal of money—nearly as much as that projected journey of his to London with Mr. Summerhayes, against which I have set my face so firmly, telling him he must give it up; we could not possibly afford it.

"Nor can we. Even with all the lightening of my housekeeping through Mr. Oldham's kindness" (the rector had long ago given the children what he called "a quarter of a cow," namely, a can of new milk daily, with eggs and butter, fruit and vegetables in unlimited supply, from his own farm and garden)—"even with all this I shall scarcely succeed in making ends meet this Christmas; and if we have any extraneous expenses out of the house we shall not be able to pay our Christmas bills. And oh! what a terrible thing that would be—sorer than any thing which has yet happened to us!"

Sore things had happened them occasionally; but she rarely noted them down except by implication. This, perhaps, was one of them:

"César, mon petit César, wearies me to let him learn drawing of Mr. Summerhayes. Not that he has any particular talent for it, but it amuses him, and he likes it better than his book. And it takes him away from home—from our poor little house—going sketching about the country with papa and Mr. Summerhayes. Not that they do much work; indeed, I think Mr. Summerhayes has little need to work—he is not a "poor" artist apparently; but it is a lively, wandering, pleasant life, such as most men take to eagerly. I wish Edward did not take to it quite so much; it does no good, and it is very expensive. I myself have no great faith, nor a very warm interest in this Mr. Summerhayes. Still, he is a pleasant young fellow enough: my husband likes him, and so do my children, especially my two eldest. Poor little Adrienne, who at eleven years old is twice as clever as her brother in her drawing as in other things, though she is such a tiny dot of a child—Adrienne, I see, quite adores Mr. Summerhayes."

"My" children—alas! a deep meaning lies under that small word, that unimpressive, apparently unimportant "my."

There came a period in Mrs. Scanlan's marriage—as it does in many a marriage which looks comfortable enough to the world and jogs on fairly to the last—when the wife was gradually becoming absorbed in the mother.—Now a voice at my elbow, and one I can not choose but listen to, knowing it is often both wiser and tenderer than my own, whispers that this is a wrong thing, a wicked thing—that any woman who deliberately prefers her children to her husband is unworthy the name of wife. To which I reply that no man worthy the name of husband need ever fear that his wife *will* love him less than she loves her children—the thing is unnatural, improbable, impossible. But all the shams in the world will not exalt an unworthy husband into a position which, even if he had it, he could not keep. He will find his level, and the chil-

dren will find theirs, in the heart which is never likely to be very false to either.

But of that mysterious thing, love, it is as true as it is of most other things—what people win they must earn. When Josephine de Bougainville married Edward Scanlan she was a mere girl, little beyond a child, and he a grown man—at least he considered himself as such. When she developed into the woman that she was, a creature embodying more than any one I ever knew Wordsworth's picture of

"A perfect woman, nobly planned,
To warn, to comfort, and command,"

he remaining still what he was, an average young man, no better than most young men and inferior to many—the difference between the two showed fearfully plain. Less in their mental than in their moral stature: Edward Scanlan was a very clever fellow in his way; brilliant with all Hibernian brilliancy, and the Hibernian aptitude of putting every talent well forward, so that, like the shops in the Rue de Rivoli and the Palais Royal—all the jewelry was in the windows. Of mere brains he had quite as much as she; or even if he had not it would have mattered little. Many a clever woman loves passionately a not particularly clever man, when she sees in his nature something which is different from and nobler than her own. And seeing this she can always place herself, quite naturally, in the inferior attitude, which to all women and wives is at once so delicious and so indispensable.

But to wake up from that love-dream and find that its object is quite another sort of person from what he was fondly imagined to be; that her affection toward him must, if it is to continue at all, entirely change its character, and become not a loving up but a loving down—an excusing of weaknesses, a covering over of faults, perhaps a deliberate pardoning of sins—this must be, to any wife, a most awful blow. Yet it has happened, hundreds of times; and women have survived it, even as they survive love-disappointments, and losses by death, and other agonizing sorrows, by which Heaven teaches us poor mortals that here is not our rest; and that, deeper than any thing stock phraseology can teach, comes back and back upon us the lesson of life—to lay up our treasure not overmuch in this world, but in that world "where neither moth nor rust doth corrupt, and where thieves do not break through nor steal."

The blow falls, but, happily, it seldom falls suddenly. And being so utterly irremediable, women, especially those who have children, become reconciled to it; make the best of it; take it as other women have done before them, and pass gradually out of its first blinding darkness into that twilight stage of much-enduring matrimony, which seems to be the lot of so many, and with which so many are apparently quite content. Nevertheless, to those happy wives who, thank God! know what it is to

live daily and hourly in the full daylight of satisfied love, such a region appears only a better sort of Hades, peopled with the flitting ghosts of departed joys.

Into that silent valley of endless shade the young matron, Josephine Scanlan, had slowly passed.

I do not allege that her husband was unkind to her: personal unkindness was not in his nature; he was far too easy and good-tempered for that. It would almost have been better if he had been a little unkind sometimes. Many a bad-tempered man is not essentially a bad man, and a woman like Josephine could have borne patiently some small ill-usage, had it come from a husband whom in other things she could deeply respect. I have heard her say sometimes, "that common men break their wives' heads, and gentlemen their hearts: and the former was a less heinous crime than the latter." Be that as it may, I think she herself would have borne any personal wrong easier than to sit still and endure the maddening sight of watching her youth's idol slowly crumble down into the very commonest of clay.

It may be urged, first, why did she set him up as an idol, when he was but an ordinary man? Well, that may have been a very silly thing, yet do not all women do it? And would their love be much worth having if they did not do it?—Secondly, finding him to be what he was, why did she not try to improve him?

It is a melancholy fact that some men can not be improved. A strong nature, warped to evil, may be gradually bent back again to good; but over a weak nature no person has any power; there is nothing to catch hold of; it is like throwing out the ship's sheet-anchor into shifting sands. Edward Scanlan's higher impulses were as little permanent as his lower ones. "Unstable as water thou shalt not excel," had been his curse through life; though—so bright and sweet are the self-delusions of youth—it was not for some years that his wife discovered it.

And, mercifully, Ditchley did not discover it at all, at least not for a long time. It was one of those failings which do not show outside. He was still the most interesting of men and of clergymen; played first fiddle in all societies; and if he did hang up that invaluable instrument at his own door, why, nobody was any the wiser: his wife never told. Perhaps, indeed, it was rather a comfort to her to have the fiddling silenced within the house—it would have been such a cruel contrast to the struggle that went on there: the continual battle with toil, poverty, and grinding care.

The one bit of sunshine at Wren's Nest was undoubtedly the children. Rough as they were, they were very good children, better than many rich men's offspring in their self-denial, self-dependence, and uncomplaining gayety amidst all deprivations, which they, however, having never known any thing better, did not much feel. Here, too, the Irish light-heartedness of their

faithful Bridget stood them in good stead; and their mother's French adaptability taught them to make the best of things. The little girls began to do house-work, sew, and mind the baby; the little boys to garden and help their mother in all sorts of domestic ways; and this at an age when most children are still in a state of nursery helplessness, or worse. The incessant activity of little people, which in well-to-do households finds no outlet but mischievousness, here was always led into a useful channel, and so did good instead of harm. Work became their play, and to "help mother" their favorite amusement. She has many an entry in her diary concerning them, such as this:

"This morning, Adrienne, standing on a stool at my ironing-table, began to iron pocket-handkerchiefs, and really, for her first attempt, did it quite beautiful. She was so proud; she means to do it every week now, and I mean to let her, provided it does not injure her poor back, which not yet is as strong as it should be. I shall not, however, allow her to carry the next baby." Alas! the "next" baby.

Or this:

"César and Louis went up to the Rectory all by themselves, to fetch a great bundle of young cauliflowers, which my children are so fond of, saying, when I cook them *à la Française*, meat at dinner is quite unnecessary. They planted them all by themselves, too. Papa said he would show them how, but he happened to be out. He takes very little interest in the garden; but my two boys are born gardeners, and love every inch of the ground, and every living thing upon it. I wish they may make it produce more than it does, and then we need not accept so much from the Rectory. It is always a bad thing to be too much dependent upon even the kindest of neighbors; and so I often say to the children, telling them they must learn to shift for themselves—as assuredly they will have to do—and try and be as independent as possible.

"I had to tell them yesterday that they must try and do without sugar to their tea—grocery is so very dear now. They pulled a wry face or two at the first cup, but afterward they did not complain at all, saying 'that what mother did, surely they could do.' My children are such exceedingly good children."

So it came to pass that finding, young as they were, she could actually respect and trust them more than she could their father, she gradually loved them best. A mournful truth; but does any mother wonder at it? I, for one, do not.

No household is very dreary so long as it has children in it—good children, and merry with all the mirth of youth. The little Scanlans must have had their fill of mirth; their happiness made their mother happy also, in a sort of reflected way. She was still young enough to become a child with them, to share in all their holiday frolics, their primrose gatherings, hay-makings, nuttings, skatings, and slidings. All the year round there was something doing;

HELPING MOTHER.

in the endless variety which country children enjoy. But from these festivals the father was usually absent. They were "not in his line," he said; and when he did go, he enjoyed himself so little that the rest of the young party found, in plain language, "his room was better than his company." That grand and lovely sight—I use advisedly these strong adjectives—of a father taking a day's pleasure with all his children round him; stooping from his large worldly pursuits to their small, unworldly ones; forgetting himself in the delight of making them happy—with a happiness which they will remember long after he is laid in dust—this sight was never seen at Ditchley, so far as concerned the Scanlan family. If Ditchley ever noticed the fact, reasons for it were never lacking. Poor Mr. Scanlan's parish duties were so very heavy;—it was quite sad to think how little he saw of his family—how continually he was obliged to be away from home.

That was true; only, strange to say, nobody at home seemed much to miss his absence. Perhaps, unconsciously, the little folks betrayed this; and, as they grew up—being remarkably

simple and straightforward children—found it difficult not to let their father see that they had discovered certain weak points in his character—inaccuracies and exaggerations of speech, selfishnesses and injustices of action—which discovery could hardly have been altogether pleasant to Mr. Scanlan. He gradually ceased to look oftener than he could help into César's honest eyes, which sometimes expressed such intense astonishment, to say the least of it, at the father's words and ways; and he gave up petting little Adrienne, who sometimes, when he did something that "grieved mother," followed him about the house with mute looks of such gentle reproach that he could not stand them. His love of approbation was so strong that he could not bear to be disapproved of, even by a child; but he did not try to amend matters and win approval; he only got vexed, and took the usual remedy of an uneasy conscience—he ran away.

Alas for his wife, the woman who had to excuse him not only to herself but to these others—the quick-sighted little people, whose feelings were so fresh and clear—what must her diffi-

culties have been? And when, all excuses failing before her stern sense of absolute right—the justice without which mercy is a miserable weakness or a cowardly sham, the duty toward God, which is beyond all obedience to man—she had, as her sole resource, to maintain a dead silence toward her children with regard to their father—how terrible her trial!

The only comfort was, that nobody knew it. Ditchley pitied the curate's wife for many things: because she had such narrow means and such a large family; because, being such a charming, elegant, and accomplished woman, she was only a curate's wife, doomed to have her light hidden under a bushel all her days. But it never thought of pitying her for the one only thing for which she would have pitied herself—the blank in her heart where an idol should have been—the sad silence there instead of singing—the dull patience and forbearance which had taken the place of joy and love.

No wonder that her beauty began to fade, that her cheerfulness declined, or was only prominent in her intercourse with children—her own and other people's. Grown-up people she rather avoided; her neighbors, with whom she had been so popular once, said among themselves that Mrs. Scanlan was not quite so pleasant as she used to be; was overridden by domestic cares, and growing rather unsocial, hard, and cold. Nay, some of them sympathized with her husband in having so little of a companion in his wife, and quite understood how it was he went out so much, and alone; one or two married ladies, who were very well off and had no children, blamed her openly for this; and said it was "all her fault if Mr. Scanlan went too much into society."

Mrs. Scanlan heard it, of course. Birds of the air always carry such a matter. She heard, and set her lips together in that stern hard line which was becoming natural to them—but she said not a word. She never defended herself at all, either then or afterward. So, by degrees, the kindest of the Ditchley ladies left her to herself, to carry out her lonely life at Wren's Nest, which was a good mile away from the town and its prying gossip. Often she passed days and weeks without receiving a single visitor, and then the visiting was confined to an exchange of calls, at long intervals, kept up, Ditchley owned, for civility's sake, and chiefly out of respect to Mr. Scanlan. He was popular enough; not run after quite as much as at first, perhaps, yet still very well liked in the neighborhood, and always welcome in any society. But it was such exceedingly up-hill work keeping up acquaintance with Mrs. Scanlan.

One person, however, maintained toward her a firm fidelity, and that was the rector. Not that he showed it in any strongly demonstrative way—he was by no means a demonstrative man—but he always spoke of her in the highest terms, as "a first-rate woman," and specially "a woman who could hold her tongue." And though, from something she let fall in thanking

him for her silk dress, he delicately forbore making her any more personal presents, his thoughtful kindness with regard to the children was continual.

He did not raise his curate's salary, in spite of many a broad hint from that gentleman; but he helped the household in many a quiet way, often obvious to no one but the mistress of it—and to Bridget, who had a very great respect for Mr. Oldham—at least so far as was consistent with her evident and outspoken disapprobation of men as a race, and especially as clergymen.

"I'd like to put my missis in the pulpit," said this excellent woman, who lived before the great question of women's rights was broached. "I wonder what she'd say? Any how, she'd say it better than most men; and she'd act up to it too, which isn't always the way with your parsons. Their religion's in their head and in their mouths; I'd like to see it a bit plainer in their lives."

This may show that the curate's was not exactly a "religious" family. They kept up all the forms of piety; had prayers twice a day, and so on; the Bible, lying always open on Mr. Scanlan's desk, and tossing about in his coat-pockets, was read aloud enough, especially the Epistles, for all the household to know it by heart. But Bridget once told me her mistress had confessed that, for years, to hear certain portions of the Bible read actually turned her sick, until she had laid it aside long enough to come to it with a fresh and understanding soul, free from all the painful associations of the past.

And so the Scanlan household struggled on, living "from hand to mouth"—with often a wide space between the hand and the mouth; while many a time it needed all Josephine's vigilance to take care that even the hand which led to the mouth—those poor hungry mouths of her dear children!—should be strictly an honest hand. For that creed of the De Bougainvilles, "*Noblesse oblige*," which held that a gentleman may starve, but he must neither beg nor borrow—this creed was not the creed of the Scanlan family. It was Mrs. Scanlan's hardest trial to keep sternly before her children's eyes that code of honor which her husband talked about, but neither practiced nor believed in. And when at last the climax came—when their "difficulties" increased so much that it was obvious the year's income could not possibly meet the year's expenses—then she recognized fully what a death-blow it is to all conjugal peace and domestic union when the husband holds one standard of right and the wife another; or, rather, when it is the wife only who has any fixed standard of right at all.

As usual, the collapse came suddenly—that is, the discovery of it; for Mr. Scanlan would go on for days and weeks playing on the brink of a precipice rather than acknowledge it was a precipice, or speak of it as such. He disliked even to open his lips on what he called "unpleasant subjects." He left all these to his wife.

"Do you manage it, my dear," he would say; "you manage so beautifully." The little flat-tery only now awoke in her a passing smile, but she managed the troubles for all that.

At length a day came when she could not manage them any longer; when she was obliged to insist upon her husband's speaking out his mind to her upon the critical position of their affairs.

Very much astonished was poor Mr. Scanlan! Surely this pressure must be all a mistake, springing from his wife's overweening anxiety about money-matters; an anxiety common to all mothers, he thought.

"It is not a mistake," said she, calmly, though with a hot cheek. "See there!"

And she laid before him, written out, in plain black and white, all the sums they owed, and all the money they had in hand to meet them. Alas! it was a heavy deficit.

Mr. Scanlan took up the paper carelessly. "How neatly you have set it all down, and what capital arithmetic! Really, Josephine, you ought to apply for a situation as clerk and book-keeper somewhere."

"I wish I could!" said she, beneath her breath; but her husband either did not or would not hear. Still he looked a little vexed.

"You should have told me this before, my dear!"

"I have told you, but you said it did not matter, and that I was not to trouble you with it. Nor would I have done so, till the last extremity."

"I can't conceive what you mean by the last extremity. And how has it all come about? It must be your fault, for you manage every thing and spend every thing."

"Not quite," said she, and put before him a second list of figures, in two lines, headed severally "House expenses" and "Papa's expenses." It was remarkable how equal the sum total of each was; and, naturally, this fact made papa very angry. He burst out into some very bitter words, which his wife received in stolid silence.

I do not here praise Josephine Scanlan; I think she must have gradually got into a hard way of saying and doing things, which, no doubt, was very aggravating to the impulsive Irish nature of her husband. He was fond of her still, in his sort of selfish way, and he liked to have her love and her approbation. He would have been much better pleased, no doubt, had she put her arms about his neck with "Never mind, dearest Edward!" and passed the whole thing over, instead of standing in front of him thus—the embodiment of moral right—a sort of domestic Themis, pointing with one hand to those terrible lines of figures, and pressing the other tightly upon her heart, the agitated beating of which he did not know. But she stood quite still, betraying no weakness. The thing had to be done, and she did it, in what seemed to her the best and only way. There might have been another, a gentler way: but I do

not know. Alas! that one unfailing strength of a wife, the power of appeal to her husband's conscience, certain that, even if he has erred a little, his sense of duty will soon right itself; this engine of righteous power was wanting to poor Mrs. Scanlan. She had tried it so often and found it fail, that now she never tried it any more.

She stood in dead silence, waiting until his torrent of words had expended itself; then she said:

"Now, without more talking, we had better see what is best to be done."

"Done? Why, what can we do? Where was the use of your coming to me about all this? I'm not Midas; I can't turn pebbles into pounds!" And even in the midst of his annoyance Mr. Scanlan smiled at his own apt illustration.

His wife might have replied that to throw away pounds like pebbles was more in his line, but she checked the sharp answer, and made none at all.

"I can not imagine what is to be done," he continued. "If we had any relatives, any friends, to whom I could have applied—"

"We have none, happily."

"Why do you say happily? But I know your crotchets on this head. You are totally mistaken, Josephine. Friends ought to help one another. Does not Scripture itself say, 'Give to him that asketh, and from him that would borrow of thee, turn not thou away.'"

"But Scripture does not say, 'Go a borrowing, knowing all the while that you never can pay.'"

"Nonsense! We should pay in course of time."

"We might, but I should be sorry to risk the experiment. No; fortunately for them and us, we have no friends."

She spoke in such a measured, impassive voice that Mr. Scanlan looked at her, uncertain whether she were in jest or earnest, pleased or vexed.

"You are an odd kind of woman, Josephine; much more so than you used to be. I can't understand you at all. But come, since my idea is scouted, what plan do you propose? I leave it all to you, for I am sick of the whole matter." And he threw himself on the sofa with a weary and much injured air.

She sat down by him, and suggested a very simple scheme—selling some of her jewelry, which was valuable, and almost useless to her now. But she had reckoned without her host. The sacrifice which to Mrs. Scanlan had seemed trifling, to Mr. Scanlan appeared quite dreadful.

"What! part with these lovely emeralds and diamonds, which have been so much admired, and which make you look well-dressed, however careless you are in other ways? And sell them in Ditchley, that some neighbor may parade them before your very face, and proclaim to all the world how poor we are? Intolera-

ble! I will never allow it; you must not think of such a thing."

But finding she still did think of it, he took another tack, and appealed to her feelings.

"I wonder at you! To sell my gifts, and my poor father's and mother's—the pretty things you used to look so sweet in when we were first married! Josephine, you must have the heart of a stone!"

"Have I?" cried she. "I almost wish I had." And as her husband put his arm round her she burst into tears; upon which he began to caress and coax her, and she to excuse him: thinking, after all, it was loving of him to wish not to part with these mementoes of old days. "Oh, Edward!" she said, leaning her head against his shoulder, "we used to be so fond of one another."

"Used to be? I hope we are still. You are a very good wife to me, and I am sure I try to be a good husband to you. We should never have these differences at all, if you would only mind what I say, and not hold to your own opinion so firmly. Remember, the husband is head of the wife, and she must obey him."

Here Edward Scanlan assumed rather a lordly air, which he usually did when his Josephine was particularly humble. Like most men of his character, he resembled that celebrated nettle which, if you "tenderly touch it—"

"stings you for your pains; But be like a man of mettle and it soft as silk remains."

"It is no use, my dear," continued he; "you must give in to me a little more. The root of all our miseries is our being so poor, which we always shall be while we stick in the mud of Ditchley—this wretched country town, where I am not half appreciated. As I have so often said, we must remove to London."

Mrs. Scanlan drew back from him, turning so white that he was frightened.

"My dear, you are ill. Have a glass of wine. Bridget! Here, Bridget!"

"Don't call her. I need it not. And, besides, there is no wine in the house."

"Then there ought to be," returned Mr. Scanlan, angrily: for this too was a sore subject. He had been brought up in the old-fashioned school of considering stimulants a necessity. Old Mr. Scanlan used to imbibe his bottle of port a day, and young Mr. Scanlan his three or four glasses; which habit, Josephine, accustomed to her father's French abstinence, had greatly disliked, and succeeded in breaking him off from just in time, before their changed circumstances required him to do so as a point of economy. He did it cheerfully enough, for he was no drunkard; still he sometimes went back to the old leaven, enjoyed and envied the wine at other men's tables, and grumbled sorely at the want of it at his own.

"I tell you what, Josephine, I won't stand this miserable penury any longer. That a man like me should be hidden in this hole of a place, deprived of every comfort of life, and hindered from taking his rightful position in the world,

is a very great shame. It must be somebody's fault or other."

"Whose?" At the flash of her eyes his own fell.

"Not yours, my dear; I never meant to accuse you of it. Nor the children's—though it is an uncomfortable fact that a man with a family is much more hampered, and kept back in the world, than a man who has none. Still, they can't help it, poor little things! But I am sure it would be a great deal better for them, and even for you, if we had a wider sphere. We *must* go and live in London."

But he said "must" very doubtfully, being aware of his wife's mind on the subject.

This bone of contention had been thrown between the husband and wife by Mr. Summerhayes, the artist. He had persuaded Edward Scanlan, who was easily enough persuaded by any body, that his great talents for preaching were entirely wasted in the provinces; that if he came to the metropolis, and rented a proprietary chapel, crowds would flock to hear him: Irish eloquence was so highly appreciated. He would soon become as popular in London as he had been in Dublin, and derive a large income from his pew-rents, besides being in a much more independent position as preacher in a licensed Church of England chapel than as curate of a country parish. At the time, Josephine had been able to reason the scheme out of his head, showing him that the whole thing was a matter of chance, built upon premises which probably did not exist, and running certain risks for very uncertain benefits. Her arguments were so strong, that, with his usual habit of agreeing with the last speaker, her husband had agreed with her—at first: still he went back and back upon the project: and whenever he was restless, or sick, or dissatisfied, brought it up again—using all the old complainings, and old inducements, just as if she had never set them aside; proving, with that clear common-sense of hers, that such a project was worse than imprudent—all but insane. Still, by this time she had ceased to argue; she simply held her peace—and her own opinion.

"We must *not* go to London, Edward. It would be utter ruin to both me, the children, and yourself."

"Ay, there it is," returned he, bitterly; "'me' first, the children second, your husband last—always last."

This form of her speech had been purely accidental, and if it sprung from an underlying truth, that truth was unrecognized by herself. So, naturally, her whole soul sprang up indignant at her husband's injustice.

"I do not think of myself first; that is not my way—not any mother's way. My whole life is spent for you and the children, and you know it. I am right in what I say. And I will not have my poor lambs carried away from here, where at least we have bread to eat, and one or two people who care for us, and taken up to London to starve. I *will not*, Edward."

She spoke so loudly that Adrienne put her little anxious face in at the parlor door, asking "if mother called?" Then the mother came to her right senses at once.

"No, my darling," she whispered, putting the child out, and shutting the door after her. "Run away; papa and I are busy talking."

Then she turned, saying gently, "Husband, I beg your pardon."

"You have need," said he, grimly. But he was not of a grim nature, and when she further made concessions, he soon came round.

"Nevertheless," she said, when they were quite reconciled, "I hold to my point. I can not consent to this scheme of yours, or rather of Mr. Summerhayes's."

"You are very unjust—you always were—to my friend Summerhayes. He is a capital fellow, worth any number of the stupid folk of Ditchley—associations quite unfitted for a man like me. But if you will have me thrown away—bury your husband all his life down here, like a diamond in a dunghill—why, take your way! Only you must also take the consequences."

"I will!" she said. And then her heart smote her once more. She had been so furious, Edward so good-tempered, and he had yielded to her so completely, that her generous nature recoiled from accepting what seemed such a sacrifice from him to her. She could not have done it, were there only herself to think of. But—those six children! And a vision rose up before her of London as she had seen it, only once in her life—passing through from Ireland to Ditchley;—ghastly London, where, in the midst of splendor, people can so easily die of want. As, supposing her husband were unsuccessful, her poor little children might die. No, she could not consent. Besides, what use would it be if she did? They had no money whatsoever, not even enough to pay the expenses of the journey.

Still, remorse for her hardness toward him made her listen patiently to another scheme of Mr. Scanlan's, which many a time he had tried vainly to persuade her to; namely, asking Mr. Oldham for an increase of salary.

"I quite deserve it," said the curate. "I do all the work, and he has all the pay. My income is hundreds to his thousands. I wonder, by-the-way, how large his income is, and who will drop in for it? His property is considerable; but he is as stingy as all rich men are. He would drive a bargain and stick to it to the very last."

"I see no harm in sticking to a bargain, if it is not an unfair one," said Josephine, smiling; "nor do I think Mr. Oldham so very stingy. Think how kind he is to the children."

"The children, pooh! Has he ever been kind to me? Has he ever fairly appreciated my abilities, and the sacrifice I make in continuing to be his curate, when I might so easily— But I won't vex you, my dear; I'll never refer to that subject again."

Nevertheless he did; being one of those peo-

ple who can not take "No" for an answer, or believe that "Yes" implies a decision; but are always trusting to the chance of other people being as weak and undecided as themselves. At last, partly in a kind of despair, and partly because she really saw some justice in the thing, Mrs. Scanlan consented that the rector should be appealed to for more salary.

But who should "bell the cat?"—a rather unpleasant business.

"I think you would do it best, my dear; women are cleverer at these things than men, and you are such an extraordinarily clever woman."

Josephine smiled at the "blarney," which she was not quite deaf to yet; seeing it was the blarney of affection. And her husband did feel great affection for her at that minute. She had saved him from a difficulty; she had consented to what he wanted, and he was really grateful to her, with that shallow gratitude for small mercies and deep sensibility to temporary reliefs which formed part of his *insouciant* disposition.

And then she paused to think the matter over. It was not her business certainly, but her husband's; still, as he said, she would probably manage it best. Mr. Oldham was rather difficult to deal with; Edward might vex him and spoil all. At any rate, he disliked the burden of doing it; and most of his burdens had gradually fallen upon her, till her delicate shoulders had grown hardened to the weight. How many another woman has been driven to the same lot, and then blamed for tacitly accepting it; ridiculed as masculine, strong-minded—the "gray mare," which is called contemptuously the "better horse!" And why? Because she is the better horse.

(While I say this a firm arm holds me, and a tender voice suggests that I am talking nonsense. But I can not be calmly judicial on this head. I know, and he who holds me knows too, that it is the truth I speak; forced on me by the remembrance of the sad life of my dear Lady de Bougainville.)

"Come, my darling," said Edward Scanlan, caressingly. "Please go to the Rectory and do this difficult business. You will do it so beautifully—a thousand times better than I. For you have a way of doing and saying any thing so as to offend nobody. Never was there a truer proverb: 'One man may steal a sheep, while another mayn't look over the hedge.'"

"And so you want me to go and steal your sheep for you?" said Josephine, laughing, and clinging to her husband fondly, in that vain hoping against hope which had so often beguiled her—that if he were a richer he would be both a happier and a better man; and that, whether or no, her continuing to love him would help him to become all she wished him to be. "Well, I will try to get you out of this difficulty, and, perhaps, things may be easier for the future. I will go and speak to Mr. Oldham to-morrow."

THE LOVER'S INTERDICT.

STOP, traveler, just a moment at my gate,
And I will give you news so very sweet
That you will thank me. Where the branches meet
Across your road, and droop as with the weight
Of shadows laid upon them, pause, I pray,
And turn aside a little from your way.

You see the drooping branches overspread
With shadows, as I told you—look you now
To the high elm-tree with the dead white bough
Loose swinging out of joint, and there, with head
Tricked out with scarlet, pouring his wild lay,
You see a blackbird: turn your steps that way.

Holding along the honey-suckle hedge,
Make for the meadows lying down so low—
Ah! now I need not say that you must go
No further than that little silver wedge
Of daisy-land, pushed inward by the flood
Betwixt the hills—you could not, if you would.

For you will see there, as the sun goes down,
And freckles all the daisy leaves with gold,
A little maiden, in their evening fold
Penning two lambs—her soft, fawn-colored gown
Tucked over hems of violet, by a hand
Dainty as any lady's in the land.

Such gracious light she will about her bring,
That, when the Day, being wedded to the shade,
Wears the moon's circle, blushing, as the maid
Blushes to wear the unused marriage-ring,
And all the quickened clouds do fall astir
With daffodils, your thoughts will stay with her.

No ornaments but her two sapphire eyes,
And the twin roses in her cheeks that grow;
The nice-set pearls, that make so fine a show
When that she either softly smiles or sighs,
And the long tresses, colored like a bee—
Brown, with a sunlight shimmer. You will see,

When you have ceased to watch the airy spring
Of her white feet, a fallen beech hard by,
The yellow earth about the gnarled roots dry,
And if you hide there, you will hear her sing
That song Kit Marlow made so long ago—
Come live with me, and be my love, you know.

Dear soul, you would not be at heaven's high gate
Among the larks, that constellated hour,
Nor locked alone in some green-hearted bower
Among the nightingales, being in your fate,
By fortune's sweet selection, graced above
All grace, to hear that—Come, and be my love!

But when the singer singeth down the sweets
To that most maiden-like and lovely bed—
All out of soft persuasive roses spread—
You must not touch the fair and flowery sheets
Even in your thought! and from your perfect bliss
I furthermore must interdict you this:

When all the wayward mists, because of her,
 Lie in their white wings, moveless, on the air,
 You must not let the loose net of her hair
 Drag your heart to her! nor from hushed breath stir
 Out of your sacred hiding. As you guess
 She is my love—this woodland shepherdess.

The cap, the clasps, the kirtle fringed along
 With myrtles, as the hand of dear old Kit
 Did of his cunning pleasure broider it,
 To ornament that dulcet piece of song
 Immortaled with refrains of—Live with me!
 These to your fancy, one and all are free.

But, favored traveler, ere you quit my gate,
 Promise to hold it, in your mind to be
 Enamored only of the melody,
 Else will I pray that all yon woody weight
 Of branch and shadow, as you pass along,
 Crush you among the echoes of the song.

ALICE CARY.

NOTES FOR TRAVELERS IN EUROPE.

I.—ENGLISH LODGINGS.

THE American traveler abroad, who lingers a week or more in the charming rural or sea-side resorts of England, or in some valley or on some lake shore in Switzerland, or dwells a month or two in Paris, often turns aside from the hotels, to which travelers chiefly resort, and establishes himself in private rooms. In England, France, and Switzerland there are the most admirable arrangements, in this respect, for the convenience of visitors. Each country, however, has its own peculiar system, quite unlike that of the others.

An English family of modest tastes and moderate means, leaving home to spend a week or more in some summer resort, rarely go to a hotel, but generally seek "lodgings," as they are called, on account of economy, retirement, and comfort. Such lodgings are to be found in great variety in every town which is the resort of visitors for health or pleasure.

On alighting at the station the traveler may leave his "luggage" in charge of the railway porter, and either take a carriage, or better, if fond of walking, ramble through the town, to see its attractions, and choose the pleasantest region. As you walk along the street, or the roads which lead from the village into the country, you see here and there in the windows of modern houses, or pretty, ivy-embowered cottages, a little white ticket with the word on it "Lodgings," or "Apartments." Noting in mind, as he passes, the most inviting of these places, the visitor pursues his circuit through the town, and, after forming a general idea which will enable him to choose somewhat his location, he stops at the door of one of these establishments that most attracts him.

A bright, tidy-looking English girl generally answers the summons, and invites the party to

walk in. This young woman, whom you do not know at first whether to consider as a servant or not, is probably the landlady. She is a well-trained servant by profession, who has accumulated a little sum out of her own earnings, and has hired and furnished the house, and is now mistress of her own establishment. She attends to your wants herself, thoroughly understands her business, and makes every thing go smoothly and well. There are larger establishments, in which there are many rooms in a *suite*, many servants, and a much more pretentious style of landlady, with prices in proportion. There are also here and there slovenly and ill-kept establishments, and a visitor must exercise some judgment if he would choose the most agreeable. On asking what apartments she has the landlady describes the rooms, saying, perhaps: "We have a sitting-room, with two bedrooms connecting, on the second-floor, and a third bedroom on the floor above, if you desire a third."

Upon asking to see the rooms they are shown to you—pleasant rooms, neatly and very prettily furnished, without ostentation, but with a fair share of that peculiar air of comfort which characterizes English homes. There is a side-board in the sitting-room; there is also a secretary, with all the conveniences for writing ready to be used, a few books upon a shelf, and, if the season be cool, perhaps coals laid in the grate ready to be lighted at a moment's notice. In every respect the rooms are prepared for immediate occupation.

The engagement of English lodgings is by the week in the first instance. The lodging-house keepers do not wish to come in competition with the hotels, and decline usually to take any one for less than that period. After the first week one can terminate his occupancy

on any day, paying at the same rate up to the time of leaving.

The prices, of course, vary very much in different places, and especially in different seasons of the year in those places which are of most fashionable resort. During the height of the season, at the sea-side resorts on the south coast of England, the prices are often double that which they are when the town is not full. During a summer sojourn of three months in England, taking lodgings in some of the most charming resorts in that country, the writer found the prices for lodgings, embracing a sitting-room and two bedrooms (one of which was occupied by a child), to be from twenty-five to thirty shillings per week—equal to about ten dollars currency. This price includes not only the rent of the rooms, furniture, and appointments, but the services of the landlady and her servant in cooking the food, serving the table, and all other household attendance necessary in the ordinary course of things for a family of visitors. A few shillings additional is, however, expected by way of gratuity, in view of the boots having been brushed, or some extra coal having been burned on the kitchen fire. And, if the visitor's agreement is not explicit that the price includes every thing, there are very likely to be some unexpected extras charged at the termination of the time. It is the usage of English people, however, to be very explicit in regard to all these details in making the arrangement in the first instance, and no American need feel that it is unbecoming to do so if he is willing to pay a good, fair price for whatever is thus explicitly agreed on. It is one thing to be exact, it is another thing to be close.

If on the first inquiry the rooms are not found to suit, or the terms are too high, the visitor bids the landlady good-morning and looks further. Whenever he is suited with the place, there is nothing to do but to sit down in an easy-chair, tell the landlady what time you wish to have dinner, and what you wish her to provide, and ask her to send to the station for the luggage; and your party is immediately at home.

As has been indicated above, the price paid to the landlady does not include the marketing. Upon the English system of lodgings, the family is left to make its own choice from day to day in this respect. One of their number may do the marketing for the family, or, if they prefer, the landlady will do it, and keep an account of her disbursements, which are to be paid in addition to her price. The former plan is quite common. Being a stranger in the town you perhaps leave it to the landlady to provide the first meal, and tell her that you will do the marketing yourself afterward. After breakfast or dinner you sally out for another walk to look in at the shops. You first inquire of the landlady where is the best market, and the best grocer, and, availing yourself of these directions, you soon find yourself in a very small but very neat little shop, having more the styl-

ish and tasty appearance of a druggist's or confectioner's shop than a grocer's, where you buy a pound of coffee, or half a pound of tea, a pound of sugar, and a little salt, a pound of butter, and some of the nice English biscuit or crackers, a little pot of marmalade, or a box of sardines, or a jar of potted beef or fish, if you like, for a breakfast relish, and invariably a pound of candles. Ordering these to be sent home, you ramble on in search of the butcher's. You find a number of other ladies out upon the same errands, each buying snug little supplies for a few days, so that you feel yourself quite in harmony with the customs of the country; and the shops are generally so neat and attractive (relying largely for their patronage upon their pleasing just such visitors as yourself), that to many persons it is a decided addition to the enjoyment of the week's sojourn in such a place to have some such errands to do every day or two.

It is not necessary, however, that the visitor should do any thing of the kind. You may say to the landlady: "I wish you to do the marketing, and I wish for dinner this afternoon such and such things, and such and such for breakfast to-morrow morning." She will make the purchases herself, and, if you are inclined to be prudent and precise in expenditures, you will require her to report to you each morning at breakfast what she paid the previous day, and reimburse her the amount.

Such establishments as these are found in the sea-coast watering-places; at all such resorts as Hastings, the Isle of Wight, Ilfracombe; in all the most charming villages of the English lake district; and in the interior watering-places, such as Matlock, Buxton, and Leamington.

There are also in many of these places boarding-houses in which all the inmates meet around a common table, breakfasting perhaps at 9, dining at 2, taking tea at 6, and a hearty supper, with meat, cheese, and ale, at 9 or half past in the evening. But living in apartments or lodgings is very different from being in a boarding-house. In lodgings each party have their own sitting-room, in which their meals are served for themselves exclusively, and at any hour in the day which they may designate; and they may change the hour as often as they please. There are, very likely, other families in the house; but every thing in English life is so adjusted to the isolation and independence of families that you will wonder, after having been in the house a week, how it has happened that you have not met any of the family who are occupying the place above you or below you. Or, if you have met one or two of them, it is after all only a matter of conjecture whether they are occupants of the same house or only casual callers. An American family occupying such lodgings sometimes make the acquaintance of an English family sojourning in the same house, because they are Americans. English people, perhaps, never would make acquaintance with each other under such circumstances.

II.—FRENCH APPARTEMENTS.

The French system is entirely different. The visitor to Paris sees here and there in the windows on the second, third, fourth, or fifth floor of the lofty houses a large card, either white or yellow, with the word "*Appartement*" upon it. If the ticket is white the rooms are unfurnished; if it is yellow they are furnished; and this device often saves one from climbing many flights of stairs, where the ticket is too high to be legible from the street.

The Parisian "*appartement*" has been often described, and a few words referring to the more modest sort must suffice to contrast it with the English lodgings and the Swiss Pension.

An "*appartement*" consists of a number of rooms, each room being called a "*piece*." The suite is usually a complete congeries of rooms for housekeeping. We do not speak of the hotel lodgings in the strangers' quarter of the town, but the temporary homes of quiet French sojourners. The rooms of one suite are all upon one floor. The visitor enters, perhaps, a small room with a polished dark wood floor, which is the ante-room; perhaps a little dark bedroom, intended for the servant, opens off from it in one corner. Little folding-doors at one end of the ante-room open into a little parlor. At one side of the parlor a door leads into one or two bedrooms. Returning to the ante-room little folding-doors at the other end open into the dining-room, warmed perhaps in the winter season by a stove made of white porcelain and bound with brass, looking like a china barrel with golden hoops, and from the dining-room a door leads into the little kitchen, which is about as large as an American housekeeper's pantry, but contains a range, or rather a stone table with circular grated holes in it for burning charcoal for the cooking, a water fountain, a sink, and invariably, too, a mirror to lighten up the room and allow the pretty *bonne* to admire her face. At one side are closets, which complete the premises necessary for the household. There are two or three suites of rooms like this upon every floor, and each has its own door-bell, the handle or cord being in the hall or on the landing of the staircase. The "*appartement*" thus constitutes a house within a house. It is a complete little house by itself; and the usages are consequently somewhat different from those in the case of apartments in an ordinary hotel.

An American traveler spending some months in Paris, who engaged such a lodging, looked in vain through all his rooms for the bell by which to summon a servant, as he would in a hotel or an English lodging-house. At last he looked out into the hall, where his eye fell upon a neat bell-pull by his own door-post. With a mingled feeling of surprise at its position, and of satisfaction at his cleverness in finding it, he pulled it, heard the bell ring, and went back to his room. Receiving no answer, he was obliged to go down stairs for what he wanted, and when Madame came up he said to her that he had rung the bell in vain.

"What bell, Monsieur?" she asked.

"The bell by the door."

"Ah, Monsieur, pardon! I should have told you. That bell is not for me, but for those who come to your door." And she pointed up to where the bell hung in a dark corner of his own little ante-room. With this explanation she joined in his hearty laugh that he had been out ringing his own door-bell.

If the occupant of such suite of rooms desires a servant he will inquire for one of the *concièrge*, or mistress of the house, or of some tradesman, or perhaps go to one of the little intelligence-offices, which are always indicated by a red bulletin-board with tickets announcing employment wanted. These are under constant police surveillance. Every servant is required to keep a book containing a record of all previous employments and her recommendations.

Such an *appartement* is engaged by the month, the price varying so much with the location, the size of the room, and the altitude of the floor, that one can not give any general idea of the rate. The occupant is expected either to engage a servant and "keep house," or, as most American sojourners in Paris might prefer to do, he may usually have his meals, or a part of them, furnished in his room by the master of the establishment, and take others at restaurants.

In the vicinity of the Boulevards and the Palais Royal, the regions most frequented by English and American visitors in Paris, there are many establishments of a character intermediate between this and a hotel, where engagements can be made by the day or week. We have described rather that sort of *appartement* which French people sojourning in Paris would choose, and which is both more economical and more strictly Parisian.

It is said that those who take *appartements* in what is called the English Quarter of Paris, where exorbitant dealing is often tolerated, should be precise in the terms of the contract, and protect themselves against unfounded demands as to the furniture by taking an inventory.

III.—SWISS "PENSIONS."

Perhaps the most charming of all such arrangements for the convenience of visitors and sojourners is the Swiss *pension*.

The traveler upon the Continent, in parts of France, and throughout Italy, will observe among the hotels in almost every city one of a less pretending appearance than many of the others, bearing the sign "*Pension Suisse*." The Swiss hotels are proverbially neat and pleasant, and this fact has led to the establishment of hotels by Swiss proprietors in a great many of the continental cities. But the native *pension* found upon the soil of Switzerland is quite different. It may be a picturesque *châlet*, with its great projecting eaves and outside balcony, perched upon the green slope of the mountains, two thousand feet above the level of the railways and the lakes, and reached by the aid of

mules. Or it may be an old-fashioned rural house, standing in a plain, surrounded by orchards and shade trees, with its flower-garden and gravel paths, and within five minutes' walk of the station and the telegraph-office. It may be a modern American-looking house, with a large sign-board over the front-door. It may be a handsome villa in the Italian style, adorned with a row of Lombardy poplars, and standing upon the slope of the beautiful banks of one of the most charming lakes in the world.

Its arrangements are intermediate between those of a boarding-house and an hotel. The visitor will usually find in such a *pension* a number of English-speaking visitors, as well as those of French or German nationalities. New-comers soon become more or less acquainted. All usually meet at breakfast, dinner, and tea, in the common dining-room, and, such as find it congenial to do so, spend the evening together in the parlor, where a good piano, chess, and other games, and a little library of entertaining reading, are generally found as a part of the appointments of the establishment. Inmates are not received in *pensions* for less than a week, though after the first week the arrangement may be continued from day to day at pleasure. The prices vary from seven francs down to three or four per day for each person, which covers all expenses except wine and washing. The cheaper *pensions* are usually cheaper not so much because of an inferior quality of food or service, but because of being in less frequented places.

Most American travelers pass too rapidly through Switzerland to enjoy the comfort and the delightful leisure of a week's quiet repose at one of these establishments. But many of those who have tried them soon modify their mode of traveling so as to resort less to hotels, and spend more time in certain selected places, making each the head-quarters from which to take excursions in the neighborhood.

One of the most charming of these which the writer has seen was on the banks of the Lake of the Four Cantons, five minutes' walk from the *quai* in the city of Lucerne. A green terraced garden rose directly from the bank of the lake, and upon it stood a commodious modern stone building, surrounded by ornamental grounds. This house was the *dependance* of the *pension*, the principal building being upon the hill, the other side of the road. At one corner of the *dependance* a very large covered piazza afforded the breakfast and tea room, in which a little company of Americans and English whom chance had brought together in the same house were accustomed to take those meals in the open air looking off upon the Lake of Lucerne. A bell-pull in the hall, connected by a subterranean wire, rang a bell in the house upon the hill whenever a servant was wanted. The Swiss girls, in their picturesque costume, came down through the garden, bringing the meals whenever called for; and, at nine o'clock, about the time breakfast was finished, Madame, the

landlady, herself came down, followed by her serving-man, and embarked in her little gondola at the boat-house at the foot of the garden, to row down to the city to do her morning's shopping. Before us upon the lake the pleasure steamers came and went, and beyond the water, on either hand, rose Pilatus and Rigi. A week of summer at the *Pension Kaufmann* was like living in fairy-land.

It was one of these *pensions*, in an elevated situation upon a hill overlooking the city of Lucerne, that Queen Victoria took for her residence during her visit to Switzerland the last summer.

English guide-books do not generally give much information in regard to these pleasant resorts; but nothing is easier than to seek them out, and to gain information from fellow-travelers as to what are the best houses of this kind in places which one is about to visit. And a traveler who occasionally delays in a rapid course, and turns aside from the great hotels to spend a week in some of these agreeable retreats, will probably find both the experience itself, and the recollection of it, among the most charming things afforded by his travels.

IV.—PARIS RESTAURANTS.—DINNERS AT A FIXED PRICE.

The stranger in Paris, on looking about in search of a breakfast or a dinner, finds himself embarrassed by the multiplicity of opportunities which offer at every step. An inquiring Yankee, who recently spent three months in exploring that city, dined every day at a different restaurant, and breakfasted at still others, so that he made a list of over a hundred whose style he had inspected and whose delicacies he had tasted.

Many of the restaurants of a more unpretending character announce upon their signs, "*Dîners à prix fixe.*" In this country it seems to be generally thought that the two systems, of meals at a fixed price and dishes served *à la carte*, are incompatible—they are not carried on at the same establishments. One finds the former method at the hotels, and the latter, generally, at the restaurants. But in most of the restaurants in the Palais Royal, and many of those upon or near the Boulevards, it is optional with every visitor whether he will take his breakfast or his dinner at a fixed price, which covers every thing, including *vin ordinaire*, or whether he will pay by the card according to the dishes which he orders.

Most of the restaurants of this class in the Palais Royal are up two flights of stairs, looking out upon one side into the streets, upon the other, by a long row of handsome windows alternating with mirrors, into the garden of the palace, where on summer afternoons a military band plays under the trees. The appointments of the room are simple but tasteful—the tables small wooden tables, a little less than two feet by three, and many of them placed together in couples so as to accommodate parties of four.

No matter at what hour you may enter, the tablecloths are spotless, though not of the finest linen, and the knives and plates bright and clean. The restaurateurs of Paris understand the art of attracting patronage in this respect better than do those of the United States, where it is next to impossible to find a clean table-cloth and fresh air unless one goes to the most expensive of places.

On taking a seat at the table the waiter hands you the bill of fare for the day, which is headed with a little statement of the fixed price for the meal, and what a meal consists of when so taken. Let us take, for example, that class of very excellent and very moderate places where breakfasts are a franc and a half (forty-two cents currency), and dinners two francs and a quarter (sixty-two cents currency). The bill of fare is divided into *entrées*—fish, vegetables, salads, and *entremets*. These bills are generally lithographed, a new one being made for every day.

The franc and a half for breakfast entitles the visitor to two dishes, to be chosen at will from either of these classes, and one dessert, as well as half a bottle of *vin ordinaire* or table claret. The bill for dinner has the addition of soups and roast joints, and the visitor is entitled, for his two francs and a quarter, to a soup and three dishes, with dessert and wine as before. The bill of fare contains several dishes under each head, and, as these are changed every day, an ample variety is provided.

It is true that the epicure will prefer to pay six or eight francs for his dinner; but then every body is not an epicure.

In Paris it is not thought derogatory to one's dignity to consult economy; and as the portions served are ample, a party of three or four, especially if one or more of them are children, usually order meals for less than the number of the party. Thus two dishes of meat will often suffice for a party of three, and so with the two dishes of vegetables and the other courses of the dinner.

It is a part of the system in these establishments for the waiters to understand and promote, as far as may be, the economies practiced by their visitors; and a waiter will not unfrequently suggest such a thing to a stranger who is ignorant or unaccustomed to it. The visitor is allowed to order any additional dish besides the meal to which he is entitled, paying therefor half a franc (fourteen cents currency), and to order any superior kind of wine in place of that included in the bill, in which case he is allowed half a franc for the *vin ordinaire* which he does not take.

There are a great variety of those places at different prices, from seventy centimes for breakfast, and eighty centimes for dinner (that is, about twenty cents currency), up to three and four francs each (about a dollar currency). In general the proprietors of the cheapest places make up for an inferior quality of viands by a greater variety upon the bill. The best places

offer less variety from which to choose, the most expensive usually offering no choice at all, but a simple bill of one excellent dish of each class, giving the same dinner alike to all visitors.

It is the universal usage to give the waiter one sou for every franc paid for the meal. All moneys thus received the waiters drop into a box on the counter, and divide the contents among themselves at the end of every week.

There is no fixed hour for these meals like that necessarily set for a *table d'hôte*; but the breakfast is usually served from ten until one or two, the dinner from five to eight.

At any of these places the visitor may, if he prefer, order special dishes, and paying according to what he orders; but the dinner of the day is usually composed with so much "artistic" judgment, and it is so much more economical for one who wishes a full meal to take it at the fixed price, that that method is generally pursued by the habitual frequenters of such restaurants.

The politeness, attention, and good taste that make even the humblest of these places agreeable to the visitor, is in very marked contrast to the manners which often appear in the restaurants of other cities.

These establishments, by affording good meals, with a scrupulously neat service, at moderate prices, avoiding the waste which a great variety of dishes involves, and the high rents which rooms on the first-floor demand, secure a large, regular, and constant patronage. Many of them sell "*cachets*," or meal-tickets, by the package of fifteen or twenty at a slight reduction from the rates fixed for single meals.

It would be a happy day for gentlemen who have to dine "down town," if a similar system should ever be found profitable in American cities.

V.—SOUVENIRS OF TRAVEL.

The least acquisitive of people begin, before they have finished a European tour, to show some symptoms of the disposition of a "collector." And there is good reason for it. Recollections are a large part of the pleasure to which foreign travel gives rise; and recollections are perpetuated and revived by the possession and use of the articles which the traveler collects. Long purses and big trunks may have no embarrassment here; but moderate means may be helped out by a little reflection on the nature of souvenirs.

It is a mistake to suppose that the excellence of a souvenir has any direct relation to its intrinsic value. A very costly article, which is to be rarely used, is not so good a memento as something which is to be often in sight. It is not the intrinsic value, but the associations the thing awakens in the mind that afford the pleasure; and these associations are multiplied by the frequency of use.

"My dear," said a lady to her husband shortly before leaving Paris, "before we go I wish you would go out and get me a button-hook—a little

one, to button my gloves with. You can get it across the street."

"We can do better than that," he replied. "It will be just the errand we shall want in the next town we stop at. So, if you don't want it this morning, we will reserve that for Dijon."

At Dijon, therefore, after visiting the regular lions of the town, it became necessary to explore the town for a button-hook. This exploration involved a charming ramble on the walls, and the discovery of a new "lion" in the form of a medieval church newly restored, and with a perfect blaze of color and gold lining the whole interior (decorations that had just been completed, and had not yet found mention in the guide-books); and last of all, the party found a little cutler's shop. As they approached it across the square they were informed by an inscription on a black marble tablet that in this house Bossuet was born. The little shop was all as bright and shining as a new knife-blade. A pretty French girl showed the wares, and gossiped in their chatty style during the momentous process of selecting a button-hook in Bossuet's house. I doubt if that lady ever uses her button-hook without a delicious dream of foreign scenes stealing over her mind: first comes the vision of the pretty cutlery shop in Dijon, then the memory of the great preacher, then his tomb previously seen in Paris, then the resplendent church in Dijon again, the vision fading away into a sunny memory of the walk upon the old walls overlooking vineyards and the ancient moat, and curiously mixing itself with the sunset glories of another evening upon the old walls of the English Chester.

An old and experienced traveler, who understood well the secret of pleasant associations, once said that his principal preparation for going abroad consisted in using up and giving away his "American things," so that he might begin to supply himself anew as he traveled on the other side. When he came home it was with a sole-leather trunk that reminded him of Liverpool, an umbrella that spread the brilliant panorama of Regent Street, a hat that always made him think of the Boulevard des Italiennes when he looked into it as he put it on, a pencil-case which had a sort of Palais Royal feeling, a watch that spoke of Switzerland at every tick, a cane that he had cut, perhaps in the Tyrol, a pocket-book of Russia leather from Vienna, and a pair of spectacles from Berlin.

Every body collects something; one gets photographs, another flowers. A young lady to whom finding herself in a country where nice kid gloves can be had for half a dollar a pair is the most lively sensation of the trip, buys a new pair in every town she visits, and could rehearse the journey by recalling the gradations of style and color in that article. It would be very amusing to peep into the pockets and bags of a dozen parties of tourists thrown together

by chance in one boat returning from the Continent across the English Channel, and compare their acquisitions. Here is a little girl who has her Paris doll—a charming lady; her Swiss doll—Bernese costume with white sleeves, velvet bodice, and silver chains; her Florence doll—a Sister of Charity with white sun-bonnet; her German doll—a fat, rosy-cheeked Gretchen; and half a dozen others; besides a Nice hat, a Spezia hat, a Bavarian head-dress, and other local costumes, on the doll scale. The little girl's father has his pocket-book crammed with his complete collection of hotel bills, which he is fond of comparing with other gentlemen interested in that subject. Another tourist has collected all the guide-books in the English language, and has a map of every city he has been in. This lady has a flower or a leaf from every place which bears bright or tender associations. Here is a young man who has picked up a copy of all the caricatures and grotesque prints he has seen between the *quais* of Paris and the curiosity shops of Rome. This young lady has commemorated every city with a new brooch and ear-rings. Another has Byron's "Childe Harold" and Rogers's "Italy," with views of every place described, which she has gathered in suitable size to be bound in when she reaches home. This young girl has a collection of *carte de visite* pictures of places or of costumes. Another has a complete collection of the coins of every principality he has entered. That gentleman has, besides his Alpenstock, between twenty and thirty canes, each purchased for a separate walk, and brought home "to remember it by." That energetic young man, who has destructiveness large, as the saying is, and is not over-reverent though he is a theological student, has a piece of wood, stone, metal, or brick, which he has cut, knocked, or wrenched off of every sacred place he could lay his hands on. You can not help being interested in a little written prayer with a thread through the paper, which he shows you, saying that the way they pray in Langres is, to tie a paper like that to the iron grating of the Lady Chapel in the Cathedral, and go away and leave it for the Holy Virgin to read: he took it off when the sacristan was not looking. You say nothing to his bits of marble, slyly kicked up from the mosaic floor of the Pantheon, over the tomb of Raffaele; but when, after describing to you the consternation of the vergier in Luther's old church in Nuremberg when he rushed up into the pulpit and struck up Old Hundred, he whispers to you, in confidence, that he has "got a leaf out of the Bible Luther used to read from," you are tempted to collar him, and give him in charge to the first policeman.

Many persons regret, as they draw near the close of their tour, that they have not preserved more mementoes of the scenes through which they have passed. This is often the case with those who travel rapidly, and find their impressions becoming confused and inexact. Photographs of the places seen rectify and perpetuate

our recollections; and one could not have a more valuable souvenir of a glimpse of Europe than a port-folio of large photographs. The traveler can supply this, in some degree at least, in Paris or New York, on his return; but half the value of the picture is dependent on the recollection that you bought it on the spot, or picked it out as the best, from among Allessandri's or Macpherson's treasures at Rome, or Carlo Ponti's under the arcades in Venice. Large photographs can be conveniently bought *unmounted*. They can then be rolled, and a large number can be carried in a small space; and at home any good photographic artist can mount them at a trifling expense.

Many who visit Venice now bring away one of Carlo Ponti's "Megalectoscopes"—a sort of gigantic stereoscope which magnifies large photographs, and gives a semblance of reality to the view. Views purchased for this instrument should not be more than about $9\frac{1}{2}$ inches by $13\frac{1}{2}$ in the plate. Smaller views may be used in it.

Stereoscopic pictures may be found every where. For young people nothing is better than the little photographs of *carte de visite* size. If you require a young girl to choose these for herself, and to write with her own hand, on the back of each, the name of its subject, and the place and date of purchasing it, she will make a charming itinerary without the trouble of "journalizing." She will look them over constantly, to while away tedious hours in railway cars and describe them to companions she meets, and will bring home far more vivid recollections than unaided memory could retain. Not only scenery and cities are illustrated in this way, but copies of the finest works of art, pictures of the picturesque local costumes, and portraits of noted men and women, may be obtained in the same form. Nothing could be a more instructive amusement than to collect in this way notable ideals in the art, history, and topography of the countries visited.

Those who have leisure and inclination for much writing either send long letters to friends at home or keep a journal. The wise man does not always keep a journal, but he often carries upon his travels a little pocket-book in which he jots down each day the name of the place he is in, and of the things which seem to him of most interest, the addresses of the acquaintances he finds, and the places and things on his route which fellow-travelers recommend him to seek.

One who keeps a journal will find it easy to add much interest to it by inserting pictures of the places visited. All through England and Scotland pretty views upon note-paper of the places frequented by tourists can be bought at the stationers'. Small photographs can also be used for embellishing a journal. Let them lie in a basin of water for half an hour, and the thin proof will peel off the card, and when dry it may be gummed into the book. The writer has seen several illustrated journals kept in this

way by different persons, and the families of their possessors prize such records beyond measure. One little girl who was learning to write about the time the family she was with landed in England, was provided with a neat scrap-book, and encouraged to fill it with pictures of English scenes, writing, or at first printing, in her rude way, her own account of what she saw. Were it possible to present a fac-simile of one of her pages it would be more entertaining than any of these paragraphs.

Those who do not wish to write at all will find it amusing to keep a scrap-book. Put in a bill of fare from the steamer table; the programme of the great musical festival you attended; the cards of friends who called on you in London; the pictures of the hotels you stopped at, cut from the top of their bills; the label of the first wine-bottle that is opened for you in France, if you please; that little sample of silk that you saw woven with your own eyes in Lyons; the card that admitted you to the ambassador's ball; the certificate of perpetual indulgence which you bought, for the joke of the thing, in Italy; the passport you carried; and the unfortunately useless duplicate of your bill of exchange. These, and a thousand other things, have each their own story, and many of them you will wish to refer to. When you have stuck them into a volume, and put in, for a frontispiece, a piece of a map cut out of an old Bradshaw, and marked your route plainly on it with a colored pencil, you have made a history of your voyage without writing a word.

The prettiest books of this sort are the albums of pressed flowers which some ladies bring home with them. Two little pieces of board, or of very stiff pasteboard, as large as a pocket-book, with a few dozen pieces of blotting-paper between them, and a stout cord to wind about them, constitute a flower-press that can be carried in the pocket. It assists in preserving the colors to change the papers after a few hours' pressure. Flowers thus gathered from the gardens, the palaces, the cottages, and the graves visited, form a beautiful memorial of cherished associations. When arranged upon the white pages of a suitable scrap-book, they present the story of a pilgrimage to a hundred shrines. Here is a daisy from the fields that Burns plowed; here a wild weed that grew on the mossy mantle-piece of the now roofless chamber in which Mary Queen of Scots was born; here is ivy from Kenilworth; and here Alpine flowers from the Valley of Chamouni. Of course there is much scope for fancy in the arrangement of such leaflets. The writer recently saw such a volume in which a few feathers, dropped by the famous pigeons in the square of St. Mark at Venice, had been ingeniously arranged in the similitude of a black gondola. In another Dryburgh Abbey was pictured with leaves and mosses. Another similar volume had the word "*Malmaison*," the home of the unhappy Josephine, spelled out on the page in tiny trefoil gathered in the garden of that

charming, melancholy villa. Another volume contained a photograph in the centre of each page, bordered with leaves and flowers.

Some persons prefer to do this work of arrangement while on the journey; others to bring home their treasures in a compacter way, and arrange them afterward. Newspaper will serve for packing the flowers, but blotting-paper is much better for pressing them in the first instance, and better still is a whitey-brown paper sold for the purpose in Europe. As for muci-lage, powdered gum carried in a little vial, and mixed, a few grains at a time with a few drops of water, as wanted, is the most convenient. Gum-tragacanth is better than gum-arabic for fastening pressed flowers. Scrap-books are plentiful in England, but hard to find on the Continent. Even in Paris they must be made to order, if wanted.

In all this we have hardly spoken of the regular souvenirs, "the specialties of the place:" articles de Paris, Swiss carvings, Italian paintings, laces of Brussels, mosaics and statuettes of Florence, coral of Naples, gold and silver filigree of Genoa. These have an intrinsic value that distinguishes them from souvenirs whose whole interest is in the significance of association. But after all the trifles often give as great a pleasure. The button-hook of Dijon, the Burns daisy, the sprig of living ivy brought from Stratford-on-Avon and fairly rooted on the garden-wall at home, have their own peculiar value, though they cost nothing.

VI.—GETTING THROUGH THE CUSTOM-HOUSE.

Children who go out on a ramble come home with their pockets loaded with shining pebbles, bright leaves, cones, fungi, acorns, wilted flowers, mossy twigs, and boxberry leaves. So we, of a larger growth, bring home from our wanderings our own equally precious selections. Fortunately, that which is rubbish to mamma is treasure to the child. Uncle Sam, too, who maternally inspects us and pries into our acquisitions as we come through the custom-house, does not value things according to their capacity for giving pleasure to the possessor. The inspector turns up the corner of the folds of

garments in the trunk—what does he care for that brown stick? Take care—don't drop *that* out for the world! that's a piece of box-wood that I cut growing upon the magnificent ruins of the Coliseum at Rome, and is to be made into the most precious of pen-handles for my library table. I would rather you should confiscate a dozen purchases than lose that.

"But how shall we get through the custom-house? Are they very strict? Do you think they will object to my things?" These are anxious questions which you hear new travelers put. If you are only a traveler, nothing is easier than to get through the custom-house. Produce your keys, and stand still, and they'll put you through. It is a mistake to suppose that a traveler is entitled to bring in any thing and every thing free of duty, if it be only for his *own* use and not to be sold. He may bring the baggage of a traveler only. A set of Brussels carpets, though woven to order for one's own house, a pipe of wine, or even a barrel of oatmeal, for one's own cellar, are not exempt. The law allows the traveler to bring his personal effects, not merchandise. On landing at New York the passengers are furnished with a blank form, in which they are to set down the number of pieces of baggage, and a statement of whether they have in their baggage or on their persons any thing besides wearing apparel in actual use, and other personal effects, not merchandise. Wearing apparel, which is new and not in actual use, whether made up or not, is to be stated; and a false statement subjects the articles to seizure and forfeiture. The rule is a strict one; but it is liberally and not harshly applied. Whatever travelers carry *as* travelers, with liberal allowance for the difficulty of drawing an exact line, is freely passed. The search is just thorough enough to act as a sort of sieve to let the travelers through, and catch the smugglers and smuggling travelers. And those travelers who are said to drop a gold coin or two into the hands of the inspector, while other eyes are supposed to be turned away, are guilty of a double folly. It were better to pay a hundred dollars into Uncle Sam's treasury than ten to corrupt one of his servants.

MY ENEMY'S DAUGHTER.

CHAPTER XIX.

SWEARING ETERNAL FRIENDSHIP.

BITTERLY and severely did I echo next morning the opinion of my friend the critic. What a confounded fool I had made of myself! was the first thought present to my mind. How *she* must have despised me! How steadily I had been sinking of late! This proof, the most grotesque and ridiculous humiliation I had ever been put to, was perhaps not the sharpest proof of a lowered nature which pricked my conscience.

For I had yet a conscience and a sense of

honor. I have read somewhere a story of a prince to whom a loving fairy gave a magical ring, which was to be his guide and guard through life. Whenever he did wrong, the ring was to prick his finger—sharply, in proportion to the magnitude of his fault. He erred and erred; was pricked and pricked. At last he could not stand the thing any longer; and so he angrily plucked the ring off his finger and flung it away. For a while he was perfectly happy, and could do as he liked unpricked of conscience. But of course I need not say that he went to the bad utterly—unless, perhaps, the fairy came in and somehow

redeemed him in the end. Now I had not thrown away my ring, and I felt its sharp pressure very keenly even if I had not conscience and spirit enough to do right, and thus avoid its censure.

Two things, at all events, I must do. I must make an humble apology to Christina, and another to Mr. Levison, the critic. The latter gave me no troubling thought; I knew he would receive it like a gentleman, and, indeed, that he was not likely in any case to feel much about the matter. But to meet Madame Reichstein and talk of my shame to her was something quite different—something I dreaded. Perhaps I dreaded it none the less because I saw how altered were our relations now; and I expected from her none of that tender, forgiving interest with which women who care for us as lovers, or brothers, or friends, are only too happy to anticipate our penitence and cover our humiliation.

It had to be done, however; and with an aching head and dogged heart I set about doing it. I lived now, since the Lyndons had left London, in the same house with Edward Lambert. We had taken lodgings together in Brompton; and though our hours and ways differed so much that I sometimes did not meet him for whole days together, we were still friendly as ever, with only one or two subjects on which we suspended, rather than withheld, reciprocal confidence. All this I shall presently come to; for the moment I pass it by.

This particular morning I was glad not to see him; I did not want to talk to any body. I dressed myself as carefully and well as I could; but it seemed, as I nervously and often scrutinized my appearance, that I could not get a certain dissipated and rowdy look out of my eyes and hair. All that tubbing, and sponging, and brushes, and pomade, and perfumery could do was done energetically; but I still thought the rowdy look remained, like the blood-spots on Lady Macbeth's hands or Bluebeard's key. My soul sickened at the thought of breakfast. I rejected eggs and toast and kidneys, and would not look at the *Times*. When something like a reasonable hour had approached, I started on my errand, and walked to Jermyn Street.

When I stood at the door, this soft and sunny noon, I could not but think of the drear and dripping night when, prouder of soul and purer of heart than now, I stood at this same door and sought Christina in vain. Since then I had many times crossed the threshold, but never sought to speak with her alone and face to face. If we were to speak together now, in a room alone, it would be for the first time since the night when she called a farewell to me, and the rose dropped from her bosom.

I sent up my card, was invited to come up, and I found her alone.

The room was small, elegant, with nothing even in the graceful carelessness of its appearance to remind one of the profession. Every thing was quiet, unpretentious, and even home-

ly-looking. Christina had been playing on the piano and singing in a low tone as I came; and when I entered the room she had just turned round and was rising to meet me. She was dressed in a morning-robe of purple cashmere, or some such material, with a white rose in her bosom. The color of the dress made her bright complexion, luxuriant fair hair, and deep dark eyes look even more striking and dazzling than they were wont to do, and her hair now fell around her as unconfined and careless as when it used to rouse the spinster-like anger of good Miss Griffin in the choir long ago. Rising from the piano, she threw back her hair with one hand and with an impatient toss of the head, and then held out her other hand to me. She scarcely looked up, and our eyes did not meet.

"You see," she said, with a smile, "how entirely without ceremony I receive you. My hair is in terrible disarray; but if you will make such early morning calls what can one do?"

"I ought to apologize to you for coming, and I would do so if I had not so much more serious an apology to make. I am ashamed of myself, Madame Reichstein, and of the world; and, most of all, of *you*."

"What an alarming preface! What have you done?"

"It is useless kindness, Madame Reichstein, to profess ignorance. You know only too well what I have done to shame myself, and what I have come to apologize for. Don't, Christina, don't force me to think you have really lost all interest in me by telling me that you were not angry with me, or ashamed of me, for what happened last night."

I had till now been standing, and Christina had not left her music-stool. While I was speaking she rose and came toward me.

"Emanuel," she said, gravely, "I am glad to hear you speak in this way. I am glad indeed; and I will not go on in the tone I tried to take. I *was* angry with you for—for what happened last night. I was angry, and deeply pained, and ashamed—on your account. I could not recognize you last night; but I am glad to believe you could not recognize yourself, and my mind is much relieved. I have thought of it ever since; but now, if you bid me, I will think of it no more. You are not changed, Emanuel? Not really changed, I mean? You have not allowed the world to corrupt you? There was a word or two which used to be favorite with you once—about keeping the whiteness of the soul. You have kept the whiteness of your soul, *nicht wahr?*"

She spoke with a friendly, confiding tenderness and frankness, as unlike her ordinary manner now as my drunken display of the previous night could be to my penitent sadness of this morning.

"I hope I have not changed wholly, Christina. I hope so. But times have changed, and most people round me; and I sometimes think and fear that I have been allowing myself to

sink into something of which once I should have been ashamed."

She laid her hand gently on mine.

"Emanuel, I too fear it. I have watched you closely—from friendship, believe me; and I do fear that you are allowing yourself to—well, not to improve."

"Can you wonder at it?" I interrupted her, in bitter tone. "What have I to care for? Why should I care for myself? If I have changed, have not you changed? Are you the same that you were? Do I not see that you can fling yourself into a frivolous and foolish life?"

"Do you want answers to all these questions, Emanuel?"

"No, I don't; I have no right to ask them. I have nothing to do with your way of living, or your friends, or the people you allow to hang after you, or the reports that other people spread about—I want no answer, Christina; but when you reproach me with having changed, and sunk, and all that, I can only—"

"Tell me to look at myself, Emanuel, and bring my moral lessons to bear *there*, you were going to say."

"No, I was not going to say that, although—But I was not going to say it, indeed. I was only going to say that I never set up for any thing—for great moral purpose, or nobleness, or virtue, or any of that sort of thing. I take my color—most men do—from the hues of those around them. You, Christina, were my dream for long, long years; and you know it. Well, I am awake; and I can't pretend to be dreaming any more. We are all poor creatures, I suppose; and I accept the situation, and don't set up to be any better than my neighbors. I am heartily ashamed of what I said and did last night, and I apologize profoundly for it. I offended you, and insulted your guests, and made a beast and a brute of myself; and it is very kind of you to receive me at all after such a scandal. But for the rest I have not much to say. I have not improved of late; and that's all."

I could not keep back the bitterness of my soul; it found relief, and I was not sorry. Christina did not wince, however; no, not in the least.

"Emanuel, *zwischen uns sei Wahrheit*. You remember the old scene in *Iphigenia*? Between us be the truth! You think I have greatly changed, and for the worse?"

I made no answer.

"Come, speak out!" she said, impatiently. "You think I have become worldly, and frivolous, and cunning, don't you?"

"Sometimes I do, Christina."

"I asked you when we met for the first time—I mean the first time since long ago—not to judge me merely from the outside. I don't show to advantage, and I don't always want to; but I don't wish to lose your good opinion wholly, Emanuel; the more as you seem to make my falling off a sort of excuse for your

own. Come," she said, and she sat in a chair and pointed me to another—"come and tell me my faults. Be a friend, and speak out. I have spoken frankly to you."

"To-day, just for this moment, you have."

"To-morrow, perhaps, I shall be cold and careless and frivolous; very likely I shall seem so. *You*, I might have thought, could judge a little better than by mere seemings. Well, will you tell me my faults?"

"No; and I have not been speaking of faults; only of the change that seems to have come over you."

"Then I will speak for you. You think I have no heart and no memory, and no care for any thing but flattery and excitement?"

"I have lately thought so."

"Then you are wrong, Emanuel; indeed, indeed you are. I have a sort of part to play, and I must play it. I do not deny that I love praise and excitement; but I could have loved other things better; and I still am no more in heart what you commonly see me than I am Amina or Leonora."

"Why do you keep that old man hanging after you?"

"I might reply by another question, and say, What right have you to ask? I might evade the question for a moment, as most women would, I think, and innocently ask, What old man? But I suppose of course you mean Mr. Lyndon. Well, Mr. Lyndon has long been an intimate friend of mine, and—"

"And is likely soon to be more, people say."

"Do they? How kind people are! What do they say?"

"Well, five out of every six say you will marry him."

She smiled.

"Indeed! And the sixth—who I suppose has reason to know better—what does he say on the subject?"

"Even he, I think, knows no particular reason to the contrary."

"Do *you* know no reason to the contrary?"

"None whatever."

"Then you know nothing of my life for the past few years?"

"Nothing. Except, of course, what all the world knows."

She sighed audibly.

"I am glad of it," she said; "you shall know it all some time—before long, perhaps, but not now. For a while, Emanuel, take me on trust; I am better than I seem. Listen, and I will speak to you as I never meant to speak to you again. Your good opinion is dear to me. Your friendship I would have if I could. Once, Emanuel, I loved you better than all things on earth, except—see how frank I am!—except success."

I could not repress a groan; and I rose from my chair and turned partly away.

"But I always dreamed of that success with you. And you loved me; but not so deeply and wholly—no, don't speak; if I am stayed

now I shall never be able to continue—not so deeply as I would have had. We went our ways, hoping to meet again before it should be too late. We did not so meet; it was too late. When I wrote to you in London, Emanuel, it was too late.”

“No, no, Christina—no, by Heaven! It was the idlest chance, the purest delusion, the error of a kindly, well-meaning friend that made you think—”

“All that I have since learned or guessed. But I did not and could not know it then; and you kept yourself hidden away until I hated you and myself for the unwomanly advance I had made, and the silence that followed it.”

“I never knew, I never dreamed, that Mlle. Reichstein was Christina Braun; and I was poor and obscure and hopeless, a beggar without a name.”

“Well, it is vain talking; let all that be laid aside. It is now too late, and Providence has kindly ordered it for the best. I have only brought back all this that I may say one thing for myself. I have chosen another part in life, and I mean to play it faithfully and loyally to the end. Therefore, Emanuel, I have kept back from you, and received you not even as a friend. If we were friends, you might come to know in time why I do things which appear to you now strange. I can not have you think badly of me. Your word, Emanuel; can we be friends?”

She held her hand out frankly, and her eyes met mine.

“You do not speak. Will you be my friend? Your word, and I shall expect that, once pledged, it shall be as your oath. Will you be my friend?”

I could not answer for a moment; I could not answer unconditionally at all. For half a life I had loved her; lately I had almost hated her. How could I in a moment promise to subside into pure and enduring friendship? I saw that in her eyes there came a look of anxiety and pity and pathos. She leaned now on the chimney-piece, and looked steadfastly at me.

“Christina,” I answered at last, and in tones that only struggled to be calm and clear, “I will do my best; I will indeed. That is my promise.”

She held her hand out again, and I raised it and touched it with my lips. I noticed that it was the left hand, and I saw the plain hoop of gold on the third finger.

Her eyes too fell upon it; and she colored and looked embarrassed. She glanced at me doubtingly, inquiringly, as one who considers whether the time has not come to make some confession. I wish I had allowed her or encouraged her to speak; but I did not. I had little doubt that there was some painful story—I would not call it secret—connected with her past life; either that she had lost by death a husband whom she loved, or had been separated from one who was not worthy of her. In either case I shrank with keen sensitiveness from provoking a confidence which must be painful.

Despite my pledge of friendship just made, I could not speak to Christina of her husband. I rose to take my leave.

“We understand each other, Emanuel, again; do we not?” she asked, hesitatingly.

“Better at least than before, Christina.”

“And you will not, I hope and pray, throw away your time and your prospects on—on folly and people unworthy of you.”

“Some kind friend, Christina, has evidently been telling good-natured tales of me.”

“No; but I have heard, and I have even myself observed, things that grieved me.”

“Well, Christina, I mean to reform. I hope to become a model member of society; almost, perhaps, like your friend Mr. Lyndon.”

“You talk lightly and bitterly. It pains me to hear you.”

“Forgive me; I will not talk lightly or bitterly if I can. I do mean to improve. I am not nearly so bad, Christina, as some of my friends or yours appear to think. But I am ashamed of myself; and I will try to take up again the broken threads of my life. I confess that I find life sometimes rather bitter and barren; and I don’t well know what particular gain one has from living and struggling at all.”

“Nor I, Emanuel, sometimes. But we still live, my dear; and we must do our best to make life worth having. Do you think life is more of a restraint and a disappointment to you than to me? Do you think you have less to hope for or more to strive against in every way than I have? Are you the only one who has to crush down warm and dear feelings? Ah no, Emanuel! There are others who are more tried, and have less chance of escaping. Hush!—don’t speak; did you hear nothing?”

She went to the window and looked out. It opened casement-fashion, and I saw that she was about to throw it open and apparently to step out on the little balcony in front; but she checked herself, and after a mere glance into the street, drew cautiously back. Her face was very pale when she turned to me, and her eyes shone with a lustre the more striking.

I was about to speak, but she raised her hand to enjoin silence. I remained silent, and without moving. The street outside was singularly quiet. It seemed as if sleeping in the hot glare of the sun. From where I stood I could see through the window only a part of the far side of the street. There was no life stirring there; not even a hurdy-gurdy was heard. For the few seconds we remained silent not a cab rattled down the street. In the room nothing was heard but the ticking of the little gilt clock on the chimney-piece. When, as we stood and looked at each other, a piano-string suddenly snapped, the clang came so loud and sharp on the ear that Christina positively started.

Then, in the silence which followed, I heard—just what I had heard before, in fact, as Christina broke off our conversation—three bars of what seemed to be an operatic air, but which was certainly unfamiliar to me, whistled in the

street below. The whistle was of a somewhat peculiar kind, shrill and sibilating; and the whistler stopped suddenly short at one particular note each time; almost as a bird does which is trying to learn some air from its master, and can not get over some difficult turn, and so stops and begins again. I marked all this now because my ears and senses were on the stretch for something; otherwise I should never have paid any attention to it, or perhaps even been aware of the sound at all. It was, however, the only sound to be heard; and it was clear that Christina was listening to it with all her ears.

Her face, from paleness, had grown to a deep flush of excitement, and her lips quivered visibly. When the whistling had the second time reached the same note she sighed audibly, as with profound resignation or profound relief, one could not tell which.

"Has any thing happened?" I asked.

"Oh yes; something has happened. Something very unexpected. I must ask you to leave me, Emanuel."

"Two words only. Nothing bad?"

"No; something good—very good. I did not expect it yet. I ought to be deeply thankful; I am thankful. Good-morning, Emanuel. Please don't ask me any more; and don't stay."

She was all trembling, and quite eager and excited. I obeyed her and put no further questions, but hurried from the room. Just as I was leaving, her German companion or follower came in, looking excited too, but seemingly in a wholly joyous sense. She came like one who brings good news.

When I reached the street I could see nobody on either side of it who seemed likely to have been the mysterious whistler. A man was wheeling a barrowful of fruit, wrapped in blue papers, along toward the St. James's Street end. A policeman was tramping the other way. A girl, with a roll of music in her hand, and petticoats high kilted, passed close to me. Other human beings near at hand I could not see. It did not seem likely that any one of those I had seen could have had the faculty of startling Christina by whistling the fag-end of a tune.

CHAPTER XX.

AN EXPLANATION.

THE conversation I had just had with Christina will help still further to explain a little of my past life. It was certain that I had degenerated since the renewal of our acquaintanceship. Life has to be got through somehow after the heaviest disappointment; and not often in real existence can we raise a Rolandseck over the wasted scene of frustrated love and ruined hope, and go and be pious and patient there. It was only after I had met Christina again that the full bitterness of the thought came to me that I had no longer any thing to

live for. While we were separated there was always an object, if not a hope. Now there seemed neither. I confess that I sank a little way into a sort of unmeaning joyless dissipation, for which I had naturally no taste, and into which I could not by any possibility throw my soul. The Champagne of the night and the headache of the morning just a little distracted me, and no more. Ned Lambert sometimes shook his honest head and tried a gentle laconic remonstrance; with the usual effect. I have no doubt he spoke to Christina on the subject, and urged her to bring her influence to bear. Perhaps to this I owed the pledge of friendship we had just made.

Any how, the pledge of friendship did not procure me much more of Christina's society, or apparently of her confidence. There was perhaps a warmer pressure of the hand when we met; and there was occasionally a deeper shade of interest and anxiety in her eyes as they rested on me for a moment. Sometimes I fear I only set this down to her dread on the score of my degenerating habits; and I felt rather inclined to resent than to feel grateful for it.

No explanation had come or suggested itself regarding her sudden emotion on the day when our ceremonial of friendship-vowing was so strangely interrupted.

Mr. Lyndon of course often came to the Opera. One night, just about this time, I observed him enter the stalls rather late. He came in along with a tall, thin, dark-bearded, remarkable-looking man—a man with a high forehead, sloping rather back and seamed with premature wrinkles; a man with a face which would have been stern and sharp in its expression but for a certain soft and melancholy sweetness in his liquid, luminous eyes. There was something about this man's appearance which attracted me in an instant; and I could not help thinking it attracted Christina too, for I observed that from time to time she glanced under her eyes in the direction where he and Lyndon sat; and she was too much of a true artist ever to think under ordinary conditions of sending her eyes roaming about the house in search of admiration. If you could have got a boxful of emperors, Christina Reichstein would have scorned to sing at them. So I had some reason for silent surprise when I observed that she did now and then glance quietly in the direction where this man was sitting with his friend. He was, I perceived, usually very marked and emphatic in his applause.

Mr. Lyndon and this man escorted Christina to her little brougham after the Opera. Needless to say that I did not feel much inclined to obtrude myself on such company. Christina saw me, and called a friendly good-night, with two or three words added in German, which bade me see her as early as possible next day. Mr. Lyndon and I exchanged, as usual, a very cold salute.

As I turned away I met a brother artist,

"HOW MANY YEARS AGO?"

whom I saw exchanging a salute a little more friendly with the dark and pale-faced stranger.

"Who's our friend?" I asked, nodding in the direction of the stranger, who had gone with

Mr. Lyndon to the carriage of the latter. I threw an immense amount of scorn into my voice; why, I don't know. He to whom I spoke was a Frenchman.

"But I have forgot his name. He is an Italian—indeed, that goes without saying—and he is going to be a lion of your salons here for a season, I am told. He is a patriot; he is an escaped—"

"Convict?"

"Convict—yes; that is, Austrian convict, or at least Austrian prisoner."

"I thought he had a look of Toulon about him."

"Nothing of the sort. You are not *sympathique*; nor I, indeed, no more. He has escaped somehow from Spielberg, or death, or something, and he is going to agitate your country to take up arms for the independence of Italy. And she will! Oh yes; England will spend all her moneys, and her powders and shots, and her cottons, just for a dream."

"But this person?"

"Well, that is all I know. He is a very distinguished man—quite celebrated."

"Whose name you have forgotten."

"Yes, and of whom I never heard before."

"How did you come to know him?"

"Madame Reichstein did me the honor to present me."

"How does *she* know him?"

"Oh, for that, my dear, you must not ask me. Perhaps your Lyndon has taken him in charge."

"Ah, very likely; he patronizes illustrious foreigners a good deal."

"But rather when they are in *jupons* than in pantaloons, is it not?—Where are you going?"

"Home, I think."

"Ridiculous—at this hour! Come and have a game of billiards."

"Thanks—not to-night."

"Come at least and smoke a pipe."

"No; I can't to-night."

Indeed my pipe was quite put out for that evening. I can not tell how it was that I came to associate the man I had seen in the stalls with the scene in Christina's room the other day; but I did so associate him in my mind at once. When, as she was leaving the theatre, she asked me to come and see her next day—asked me in pressing tones, and in German (we hardly ever spoke German to each other now)—I felt in some strange way that my conjecture was confirmed. I went home moodily, expecting something painful, I hardly knew what.

Christina received me very graciously when I visited her next morning—very graciously and sweetly. There was a pathetic, anxious sort of kindness about her manner which was not usual with her of late. She was embarrassed, too; and her thoughts seemed dwelling on any thing rather than the subject we first talked of. For a few minutes there was indeed an awkward pause every now and then in the conversation we carried on, as if each was expecting the other to put some question or begin some explanation.

We spoke a few words about Ned Lambert and his love, and his separation from Lilla Lyndon, of which Christina appeared to know a

good deal. I made some allusion to the one great cause of Lilla's resolution to leave London, and found that Christina seemed to understand or have guessed it.

"That, too, I know," she said. "You speak of the wretched man, Stephen Lyndon?"

"I do."

"I did not know his real name or his real nature until lately." (Here she paused.) "But I don't want to speak of him just now. I have sent for you for another purpose, Emanuel." Another pause—and then she said: "I am going to introduce you to-day to a man whose friend I want you to be; for my sake first, and then for his own. I wish you and him to be friends, and I wish that you should know our secrets. You saw me speak to a tall and dark-haired Italian last night?"

"I did."

"He will come here to-day. He is my husband."

Christina dropped her eyes as she spoke the words, and I was glad that no gaze was on me; for, despite all that had come and gone, this was a heavy shock. Spoken suddenly, firmly, the words seemed to go through me like a rifle-bullet or the thrust of a sword.

Then she looked up again, and a faint sweet smile came over her face, and our eyes met frankly; and she held out her hand to me across the table, as if in obedience to some involuntary and kindly impulse.

I pressed it silently. Thus we sealed our new friendship, and the dream of my boyhood was really over.

After a moment's pause she said: "My husband is an Italian, as you see. His name is Carlo Farini Salaris. He had a title and orders and honors; but he dropped them all because he was disappointed in Charles Albert, and in others too. He had two passions in his life—music and his country. Chance brought him to know me when I was a poor girl—an adventuress, many people would have called me—a beggar almost. He liked my voice; he had faith in me; he had me educated; he brought me out. All that I am he made me. All that I could do for him in return I have done, I am doing."

"I knew that—that you had been married, Christina. I did not know that your husband was living."

"Nor must you know it now. Understand me, it is a secret only known to you, and perhaps one or two others. He has only lately escaped from an Austrian prison, where he was sent for the part he took in Lombard plots and revolutions. He has escaped only, I fear, to take part in other plots. Think how happy the life of his wife must be! I can help him, however, in many ways while I am not known to be his wife. I have carried the fiery cross for him from the Alps to the Straits of Messina, when not even Austrian or Neapolitan police suspected the German soprano of being an emissary of the revolution. Ah, it would be a long and

weary tale to tell; it is a sad memory! In this way I hold my life at his disposal, and my happiness. I will plot for him, scheme for him; smile while I know that he is in danger, flirt when every moment I think to hear news of his death. This is the only way in which I can repay him: I owe him all."

"Surely you have given him something that might repay any thing he has done for you?"

"I have given him all I could, Emanuel; and he was generous enough to have confidence in me, and to believe that I would have given him more if I could. Listen, and I will speak to you with a frankness which others might misunderstand, but you will not. I will speak to you as if I were a ghost come back from the grave, to whom the world could no longer have reality, and who had nothing more to do with human hopes, and loves, and misunderstandings, and all the rest of it. Even before I had made a success of any kind, he would have married me, and I would not. *You* know the reason why. I succeeded through him altogether. He pressed me again and again—tenderly, delicately, like a man with a noble nature. I was coming to England. For the first time since I had left it, you understand. He guessed why I was coming, and I told him all."

"All? All of the past, or—"

"I spoke to him as freely as some of his own countrywomen do to their confessor. I told him that I loved you—yes, I am not ashamed to say it now, and I was not then—and that my dearest hope was to find you. And he said, with his melancholy smile, 'Go to England; but if you do not find him, or have any cause to change your purpose, then promise me that you will come back to me.' I went to England, and you know the rest—Fate was against us."

"Fate was cruelly against *me*!" I said, starting up; "Fate was against *me*! And you too, Christina! You threw me away at a word; you had done so before. Don't tell me of love—you never loved me; you were too glad to escape from me; you had your ambition and your career, and you followed your destiny. Well, I don't blame you, and I am not surprised. Peace be between us for the future, and let us be friends if you will; only do not torture me to no purpose by trying to persuade me that that might have been which never could have been. Well, forgive me for interrupting you—"

"You have not interrupted me; the story is all over. It was not very long to tell."

"Oh no; let me finish it. You saw me; and I was poor and obscure; and you found no difficulty in taking the chance word of a good-natured, thoughtless girl as decisive of my fate; and you hurried back, and married your friend and patron, who had influence and power. You were grateful to him—quite right; and he exacted his recompense for what he had done, and you gave him yourself as his reward. Well, I offer you my congratulations, and to him too. I am late in the expression of my good wishes,

but you must remember how well you kept the secret of your happiness, and that I thought you were a widow, not a wife."

I saw Christina's cheek flush, and her eyes first sparkle and then fill with tears; but I was not in a mood to be stayed. Every thing seemed to have conspired to make me savage, and some infernal spirit within appeared to drive me on, adding word to word.

"Emanuel!"

"Yes; I thought you were a widow. So, I suppose, did your other friend and patron, Mr. Lyndon. *He* surely is not in your secrets? Or is he supposed to be your husband's friend, appointed to console you, and give you courage in his absence and his dangers?"

"I have at least had no reason, as yet, to repent of any confidence I may have placed in him, as I have now to repent of the confidence I placed in you. Emanuel, I know you will be ashamed of your bitterness and your cruelty, and I forgive you beforehand. I know you have reason to complain. I owe you something, too; let me pay a part of my obligation by bearing patiently any insult you may choose to offer. You do not know how cruel you are. I have striven to be a devoted and loyal wife to my husband, as a brave German woman ought to be; and I have suffered much; and if I have had my ambition, it has not been fed for nothing, or bought without heavy penalty; and of the old days nothing remains; and now you insult and scorn me. It is much; but I bear it for the sake of old memories."

She had been seated on a sofa. She now stood up and leaned against the chimney-piece, and tossed her bright mass of hair back over her shoulders with the old familiar impatient action of one whom the weight of it oppressed in a moment of excitement. She looked so like the Christina of old that my anger melted away, and I bitterly repented my hasty words.

"I am always asking you to forgive me, Christina; I must ask you now again, sincerely and humbly, for pardon. I was very bitter, and rude, and brutal, and I knew how unjust I was even at the time. But I only ask you to make some allowance for me. You know how I loved you. Oh, I am speaking now only of the past, and I might say it if your husband stood there! I loved you deeply. No woman can be loved so twice in a life."

"I know it, Emanuel, and I do forgive you, freely and fully, your harsh words. You too must make allowance for me. My life is an anxious one in many ways. So far it has been a failure; and yet the best has passed. When I look at you, Emanuel, and make you my own mirror, I see that I too am no longer young. What a handsome, fair-haired boy you were when I first saw you! How many years ago?"

"Twelve years ago."

"How old are you now? You may tell me; I shall not betray confidence."

"I don't know—thirty-two or three."

"*Ach Gott!*—so old! And I am—but that

does not concern you to know. Yes, youth is gone for both of us. I am talking wildly to-day, am I not? Yes, I can't help it; but I don't often get into these moods. Youth is gone."

She turned to the mirror over the chimney-piece, and still keeping back her hair, gazed intently into her own face. Truth to speak, with all its lustrous beauty, there were faint, faint marks under the eyes, which hinted mournfully of Time's premature footprints.

"I was handsome, Emanuel, when a girl—was I not?"

She spoke without turning to me.

"You were beautiful; but surely you must know that you are still"—I was going to say, "that you are still beautiful;" but the expression of her face was so entirely abstracted and *distracted* that the compliment, if it could be called one, died upon my lips.

"Yes," she went on, almost as one who talks in a dream, "I was very handsome, and very, very ambitious. I thought I was born for something great—born, perhaps, to conquer the world. You could not know how ambitious I was, and how my heart was set on success; and nothing has come of it, after all."

"Nothing! and you the most successful of the day?"

"Yes, the most successful of the day; but who will be the most successful of to-morrow? I shall sing, perhaps, another season or two, and then be forgotten. I know well enough that I am not like Giulia Grisi. *There* is a singer to be remembered. I shall be extinguished when I cease to sing. My success will die with the echo of my voice. I have often thought that I am like the man in my much-loved Schiller's play, who says he staked his happiness and his heaven on being a hero, and in the end no hero was there, only a failure."

She leaned now on the chimney-piece, and still contemplated her own face. I dare say an ordinary looker-on would have thought there was something theatric and self-conscious in her attitudes and her ways. I did not think there was. From her childhood almost—she was little more than a child when first I knew her—there was that rare and striking harmony of mind and body in her which made every word find unconsciously its natural expression in some gesture or attitude. This was not surely, one would have thought, a German attribute. Still less was it a faculty any one can get up, or even cultivate. It came by nature. It made her a successful actress; it made her seem natural on the stage, because every action expressed so easily and gracefully the emotion which suggested it; it made her seem theatric off the stage, because so few people either will or can allow their moods to find any outward expression beyond that of voice and complexion.

She suddenly turned to me; and going back to the earlier part of our conversation, she said:

"You think I kept all this purposely a secret from you?"

I knew, of course, she meant her marriage and its story.

"I did think so, Christina."

"Well, perhaps it was partly a secret—at least, until I could learn what sort of person time and change had made *you*. Perhaps you did not at first show yourself in a manner which greatly invited confidence. Perhaps I fancied that you already knew nearly all the truth. Perhaps I may have thought—" and she stopped and sighed, and then smiled a strange, nervous, painful smile I did not like to see. Then she made a quick gesture with both hands as if she flung the subject from her, and came back to her seat. Looking at her watch, she said:

"My husband will be here soon. You know now why I was so much confused and embarrassed the last day you were here?"

"Yes; that was his signal I heard?"

"It was. He always whistles those few bars—first once, then again with the slight variation; and I know he is coming. That is, you understand, when I have not seen him for some time—when his coming is unexpected; and it may be necessary to make some preparation to get rid of inconvenient visitors—"

"Like me?"

"Like you that last day, before he knew you or had given me leave to trust you. Oh, I am thoroughly disciplined and obedient to him, believe me. I have heard that whistle in many places—in places where I knew that a mistake or a delay, or a precipitate motion on my part, might involve his discovery and his death. I did not expect to hear it so soon, although I knew that the plan for his escape out of the Lombard prison was in good hands and progressing well. I have not a genius for conspiracy, Emanuel, and they don't trust me much with details; even *he* does not. I wait and watch and keep the secrets, and do faithfully as I am told. And I have denationalized myself for his sake, and forgotten my country; indeed, had I not forgotten it long ago? and I have learned to hope that the German soldiers may one day be chased across the Alps. My husband is a man to inspire any one with his own hopes and his own will, as you are sure to discover before long."

A card was put into Christina's hand, and she directed that the visitor should be shown up.

"It is *he*," she whispered to me when the servant had left the room. "*Here*, just now, he is only on my ordinary visiting-list. He is to me an Italian patriot who honors me with his acquaintance—no more."

In a moment Signor Salaris entered.

I do not know whether he had expected to find her alone, but in the mere flash of time from his announcement to his reaching Christina, I saw three distinct changes of expression in his face. His wife stood at one side of the chimney-piece, nearly opposite the door; I had

fallen back to one of the windows looking into Jermyn Street. As he came in I could see him, but he, naturally looking directly before him, did not see me. He crossed the threshold, therefore, with the formal bow of an ordinary visitor, and the corresponding expression. Apparently then, as he only saw his wife, he assumed that she was alone, and his pale face lighted up with a warm and bright expression, and he seemed for the instant, the second, like one rejoicing to throw off a weary disguise. And then he saw me; and with a change quick as the motion of light itself, his countenance subsided into the genial, courteous expression of one who presents himself to a friend. Probably no unprepared eye could have noted these changes. I saw them clearly, and they were significant of a character and a life.

Christina reassured him with a smile and a few words.

"My dear Carlo, here we are all friends, and you are my husband, not my visitor."

"Then this gentleman," he said, turning to me and speaking in excellent English, though a little slow and with a deep Italian accent, "this is Mr. Temple? I might have known him, indeed.—I have seen and heard you more than once, Mr. Temple, but I did not at first recognize you. I offer you my hand; I am, if you will allow me, your friend."

I gave him my hand, and we exchanged a cordial grasp. I think both our faces flushed. I felt mine grow hot. I know that across his pale cheek something faintly approaching to a crimson tinge came flashing, and a strange sudden spasm passed over it. Can we be friends? Here is the man who has robbed me of Christina; can I be his friend, sincerely, truly?

I think so; at least I will try. I like the expression of his face; I like his soft dark liquid eyes, with an expression at once wild and gentle and beseeching in them, like the eyes of a gazelle; I like the contrast they present to the rigid, deep-thinking, inflexible expression of the brow and the lips and the chin. I feel sure this man has an unconquerable will, and a pure tender heart. He is artist and conspirator in one. He ought to have lived centuries ago, and been a minstrel and a patriot at once. Or he ought to have lived half a century back or thereabouts, and been a Girondist and led the chorus of the Marseillaise on the day when he and his brothers went out to die.

Yes, I liked the man at once; and as I looked from his face to Christina's and noted her expression, I liked him all the better, for I felt an indescribable pang of sympathy and pity for him. His liquid loving eye looked melancholy when it turned on her, and hers sank beneath his glance.

We talked like friends. He told me of his escape from prison in a pleasant simple kind of way, very agreeable, and even fascinating, to hear. There was a quiet modesty about all he said relating to himself that won upon one immensely. We talked of music and art, on

which he was almost eloquent. When for a moment the conversation lapsed into what may be called generalities and conventional talk, he subsided into silence, and his mind evidently withdrew itself altogether into its own habitual thoughts.

I noted that Christina's eye always quietly followed his expressions of feature; I noted that the moment he lapsed into silence she changed the conversation, appealed directly to him with some question or other, and drew him forward again. I think I read their story.

"She has given herself to him," I thought, "and she esteems him, and fears *for* him; and she would love him if she could. But she can not, and she knows it; and neither is happy. I read in his face high aim, and courage, and absolute self-devotion, and brooding perseverance—and failure. Whatever his hopes, they are doomed to fail."

Heavy and blank was the first feeling of disappointment with which I left Christina's house that day, knowing as a certainty and for the first time that she had a living, loving husband. But was I only disappointed—was the disappointment utter and without shade? Was there not some vague perception of a sense of relief? Month after month, year after year, I had worn myself out with almost unendurable agony of longing and disappointment, hopes and sickening pangs of despair; and now at last the doubt and the conflict of feeling were over, and I was released from the struggle. Now the torment of hope was quelled; now the worst was known; now the bitterness of death was past. Many a man sleeps, says the jailer in Scott's romance, the night before he is executed, but no man the night before he is tried.

Yes, I felt a sense of relief. I should torture myself with doubt and hope no more. I should walk up and down my room of nights trying to squeeze hope out of every word she had uttered, every glance I had caught—as shipwrecked sailors becalmed on a burning southern sea strive to squeeze moisture out of rags—no more. I should rehearse what I could say when next we met, or lament that I had not said this and that when last we met—no more. I should now be able to drudge through my life unvexed because hopeless. A resolve, too, came up at once with a great new pang of relief. I had become a singer and taken to the lyric stage to please her, to win her, to prove to her that I could succeed; now I would give it up. I would cease to sham an artist's part, for which I really had no true taste or soul. I would go to some other country, to America, and see my brother. How fraternal we all grow, how we think of far-off brothers and sisters and mothers, when some woman has thrown us over! We are all like the gamester in the famous classic comedy of France, who only remembers her to whom he owes his duty when the luck of the night has gone against him. I might have lived long enough content with very rare and passing scraps of news from my

brother, but now a sudden and surprising tenderness had sprang up in my heart, and I wondered how I had existed so long without seeing him; and I quite resolved to go out to the States, and perhaps, with such money as I could get together, join him in some new Western settlement, and be a farmer. I thought of my own stout and sinewy arms and rather athletic frame, and came to the conclusion that, after all, digging, or felling trees, or hunting, was the sort of thing for which Nature had clearly intended me.

In a word, I was used up, and wanted a new and freshening life. I envied my Italian friend his schemes and his aspirations, and thought I should dearly like to have an oppressed nationality to plot for, and if needs were, die for; and I really wished I could, even through his influence, get up within myself a sort of bastard philo-Italianism, and fling myself into the cause of Italy as so many Englishmen were beginning to do even then, and as Byron and Stanhope, and Hastings and Finlay, and so many others, had done for Greece. But I was never much of a politician; and I was so sick of the stage that I recoiled from the notion of converting my individual life into a new piece of acting. I had long come to think, and I do still think it seriously and profoundly, that nothing in life—no, nothing whatever—is so enviable as the capacity to merge one's individuality and very existence wholly in some great cause, and to heed no personal sacrifice which is offered in its name. I don't much care whether the cause be political, or artistic, or scientific, or what not; let there but be a cause to which the individual is subjected, in which he freely loses himself, and I hold that man happy, if man can ever be happy at all. Never had it been my fortunate fate to have found such an object. My own profession never gave it to me. Therefore I accounted existence so far a failure. I had tried many modes of activity and amusement, and distraction and enjoyment, and they had done nothing for me, because I had never gone deeply enough into any path of life, or thought, or work; I had never had a cause to live for, and I might as well not have lived at all. If I have any faith left in me, it is that faith in a cause, as the soul, the grace, the beauty, the purpose of life.

I will seek then, I said to myself, a new activity. I will steep life in freshness, and recolor it in the dyes of new sensations. *Ich will mein Glück probiren—marschiren!*

CHAPTER XXI.

EXILE AND OUTCAST.

YES; I began to think seriously of going to the United States, making my way out Westward, buying land, and turning farmer. Vague and delightful visions of the forest scenery of the New World filled me; visions of woods

where tints, which in our European region we know of only in manufactured colors, mingle and contrast in the living glory of the autumnal foliage. Dreams of the rolling prairie, and the deep wine-colored brooklet, and the rushing river, were in my mind and before my senses. It seemed to me that nothing but the fresh bosom of the young mother-Nature of the West could revive my exhausted and flagging temperament. I was fast growing more and more weary of life as I found it, and as I made it. Heat and crowd, and midnight suppers, or lonely midnight grumblings and reflections, perpetual excitement, fatigue, overwork, too much wine, and the almost incessant cigar—these began to take effect just as I might reasonably have expected. I found that my voice already was beginning to show signs of suffering. Nobody else noticed it yet; but I could not be deceived. I consulted a medical man, who recommended rest and country air; and I thought of acting on his advice soon—some time, perhaps, when the season was over, or next year, or whenever convenient.

Meanwhile I went on as before; I mixed a great deal with joyous company of all kinds. A positive necessity for distraction of some sort seemed to have seized hold of me, and it even appeared as if distraction relieved my mind and improved my physical condition. The resolve to give up the stage and go to America supplied a delightful excuse and temptation. It would be clearly a waste of power, an unnecessary vexation, to put myself under heavy restraint just now, when so short a time was to bring about a total change of life and habits. The fresh manly life of the New World would soon restore me to that physical strength and brightness of temperament which I used to enjoy. No use, then, in beginning any reform before I undertake the enterprise which shall change scene and habits and life altogether.

I sometimes even thought of the expediency of marrying and ranging myself, taking a companion with me to America to be a backwoodsman's wife. But I always ended by dismissing the idea as one that brought up a sensation of repulsiveness with it. To begin with, I knew nobody whom I would or could marry. Most of the women I knew were singers or actresses; and I saw most of them too closely to be likely to fall in love with any, even if a deeper and earlier feeling did not absorb my heart. There was one to whom at times I did feel myself slightly attracted; she was the little Frenchwoman with whom I had had a sort of flirtation on the evening when I otherwise made a fool of myself at Christina's apartments. She did not discourage my attentions whenever they were offered, and I did sometimes pay court to her. She was young and very pretty. She was not witty or intellectual, or gifted with any conversational power beyond what mere animal vivacity or flow of talk may give. I do not know why on earth I cared for her company, except that she was easy of access and full of life, and

her society served to distract me, just as smoking or drinking might.

My new friend, who called herself Mlle. Finola, and was the daughter, I came to know, of a fat couple who sold slippers in one of the passages of the Palais Royal, was a girl with a very agreeable light French sort of soprano voice, and pleasing vivacious ways, and an inordinate amount of self-conceit. She was not by any means a bad little person, and would rather, all things being equal, do a kindly thing than not. She was, I have no doubt, practically, or as Heine would say, anatomically, virtuous; but she had no particular prejudice in favor of virtue, and probably never troubled herself much by thinking on the subject. Her ideas of life consisted of flattery, singing, lyrical successes, complimentary critiques in newspapers, jewels, crinoline (crinoline was rather a new fashion then), pleasant little dinners and suppers, carriages, and a fair prospect of a brilliant match. She had no more true lyrical genius than an Italian boy's monkey; but she sometimes captivated audiences, and set them applauding with a genuine enthusiasm which Pasta might have failed to arouse. She had a quick arch way of glinting with her eyes, which conveyed to some people an idea of immense latent humor and *espièglerie*, that, I can answer for it, had no existence in my little friend's mental constitution. She turned her bright beaming orbs in flashing rapidity from stalls to boxes in a manner which irresistibly kept attention alive. Who could withdraw his interest for a moment from the stage when he could not tell but that the very next moment those glittering laughing brown eyes might roguishly seek out his own? She had apparently the faculty of eye-flirting with every man in a whole theatre in turn. Then she shrugged her very full, white, and bare shoulders with such a piquancy, and had such quick graceful gestures, and so fluttered her pretty plumage, that it was quite a pleasant sight to see. Of course all this told with much more decided effect in the Italiens, or some such house, than in one of our great temples of opera; but even in our vast house it had its effect upon the limited section from whom the rest of the audience, and the town generally, took their time.

Not, however, to be merely *piquante* and vivacious, Mlle. Finola had a way of throwing a momentary gleam of tender softness into her eyes, and looking pensively before her, as if consciousness had withdrawn itself wholly from the audience, and buried itself in the depths of some sweet inner sadness; and she so thrilled out a prolonged, plaintive, and dreamy note, that people sometimes declared her pathetic power quite equal to her humor and vivacity. When ordinary observers note any little effect produced with ease they are apt to believe that the performer has a capacity for doing something infinitely greater, if he or she would only try, and did but care to succeed. A sad mistake generally; for on the stage and in real

life we almost invariably do all we can and the best we can; and that which you see is the display of our whole stock of capability. But audiences could not readily believe that the one little bit of effective show had exhausted Mlle. Finola's whole resources. The result was that in her own parts, Rosinas, Figlias del Reggimento, and so on, she was greatly admired, and her little tricks of instinctive coquetry and vivacity were accepted by many as the deliberate and triumphant efforts of graceful art, if not indeed the stray sparks which indicated the existence of a latent fire of true lyrical genius.

Now this little personage was beginning to be very popular about the time when Christina's husband came to London. She had not, indeed, come as yet into any sort of antagonism or rivalry with Madame Reichstein, and they never sang together; but Finola's nights were usually very successful, and she was even rallying a sort of party round her both in audiences and critics. Perhaps Christina's passionate, enthusiastic style had begun to be too much for some of her hearers. True art is a sad strain upon the intellects of many of us; and little Finola was a great relief. She was Offenbach after Meyerbeer; and a good many occupants of opera-stalls to-day know what that means, and can appreciate the charming relaxation to wearied inanity which it implies. And though not as yet any thing of a rival to Christina, Finola was beginning to be talked about a good deal. I don't think Christina at this time cared in the least, or grudged the little thing any sprays of laurel that might fall to her. But she always affected to think me an admirer of Finola, one of Finola's party, and indeed, more than that, one of Finola's lovers; and at last, out of pure spleen at being so set down, I acted intentionally as if I were one of that silly throng; and as Mlle. Finola liked flirting with any one, she showed herself willing enough to flirt with me.

I have spoken of all this for the purpose of showing how matters stood as regarded Christina and myself just about the time when her husband made his appearance so unexpectedly in London. We—Christina and I—were on strange, cold, almost unfriendly terms, so far as all outer appearances went. My soul was still filled with love for her, wildly dashed sometimes with a bitterness not much unlike hate. She, on her side, seemed to me to be leading the life almost of a frivolous, careless, heartless coquette; I was drifting away from all my old moorings of steadfastness and perseverance and patience, and becoming an idler with the idle; I drank midnight, and thought midnight, as the phrase has it. With the sudden appearance of the Italian exile came a change in all our relationships; chance, utter chance, conspired with his own character and purpose, and the place he held in Christina's life, to make his presence the source of change and event to all of us.

In a very short time after his coming, Signor Salaris became the recognized lion of the London season. He had, in the *impresario's* sense of the word, quite a wonderful success. He delivered lectures on his imprisonment and his escape, which crowded Willis's Rooms, and filled King Street with coroneted carriages. He pleaded the cause of his country; he called upon England to regard the independence of Italy as Europe's most pressing and vital question; and countesses clapped their kid-gloved hands and waved their perfumed handkerchiefs. He dined now with a Cabinet minister, and now with the leader of the Opposition. He spent great part of his time at Mr. Lyndon's. He was intrigued for and battled for as the attraction of evening parties. He bore it all patiently, as one who does a work of drudgery with a good object; but he smiled sadly and shook his head when one congratulated him privately on his success. I once told him he ought to be a proud man. He said he felt profoundly discouraged. A great illusion, he calmly said, was gone. England, he now knew, would do nothing for his country. He had come to plead for protection and help. He found himself the hero of a carnival scene, pelted with flowers and sugar-plums.

I am not a politician, and this is not a political story. I introduce the subject of Salaris and his success, because at this time in one way, as later in another, it affected my own life.

I went one evening to hear my new friend tell his story and make his appeal in Willis's Rooms. I went alone; the room was crowded; Mr. Lyndon, M.P., presided. There were present what Ned Lambert would have called "no end of swells." Salaris was speaking when I got in. He was really not, in the rhetorical sense, an eloquent man. He had nothing of Kossuth about him, nor had his style any thing of the poetic grandiloquence of Mazzini. He talked in a simple, severe, unpretending sort of way, with hardly any gesticulation. The sincerity of his purpose, the clear straightforwardness of his language, the sweetness of his expression, made the great charm which, added, of course, to the romantic nature of his recent escape, delighted the West End. He was a novelty in the way of exiles. He positively seemed, I heard a lady near me remark, quite like an English gentleman. In fact, the Thaddeus of Warsaw personage was played out; and the West End now thrilled with a new sensation, to see an escaped and exiled patriot who looked like an ordinary gentleman, and spoke as composedly as a financial member of Parliament.

I looked round the room, expecting to see Christina there. I was not disappointed. She was seated two or three rows of seats away from me, and she looked very handsome, but melancholy, and a little fatigued. She was apparently not listening much more attentively than I was. She saw me, and nodded a salutation,

and whispered something to a lady at her side. The lady, who seemed to have been listening very closely to the speaker, looked up, and glanced toward me. She was very young—about nineteen, perhaps—with a delicate, clearly-shaped, youthful Madonna face, and eyes that had a tender violet light in them. They were eyes that did not flash or glitter or sparkle. They rested on you with a quiet luminous depth, like the light a planet seems to give. Her face had a thoughtful, sweet, almost sad expression until the violet light arising in the eyes suffused the whole countenance with its genial radiancy. It was a face not to be forgotten, once you had seen it; and I had not forgotten it, for I had seen it before, and had many a time wished to see it again. It was the face of Mr. Lyndon's youngest daughter; the girl to whom I had spoken in Palace Yard when wild Stephen Lyndon made his absurd mistake.

Did you ever on an evening of reckless revelry, amidst an atmosphere steaming with heat and lights and the fumes of wine, in a room ringing with laughter and frivolity, suddenly open a window, and looking out catch a glimpse of the blue summer heaven and the pure light of the stars? If so, you will understand how I felt when I looked up from the increasing degeneracy of my life, with its foolish excitements and its barren spasmodic passion, and saw the face of Lilla Lyndon.

I glanced many times to where she sat, and I forgot the cause of Italy's independence. Once, only once, she looked toward me.

There was a slight movement on the platform; a letter was handed to Mr. Lyndon. That gentleman said a word to the lecturer, who at once stopped, bowed, and drew back; and Mr. Lyndon rising came to the front and apologized for having to leave the chair. He was obliged to go down to the House immediately. His distinguished friend, the Dean of some place or other, whose remarkable work recently published had proved how well he understood the Italian question and how thoroughly he sympathized with the cause of Italy, had kindly consented to take the chair. There was a murmur of genteel applause for Mr. Lyndon, another for the Dean, as the latter gracefully threw himself into the vacated chair; and then Mr. Lyndon disappeared from the platform, the lecture went on, and the audience settled itself to listen as before.

Once, and only once, did Salaris make any attempt at eloquence; and even that was but the eloquence of passionate conviction. It was at the close, where he proclaimed, rather than merely predicted, to his hearers that, let who would be friend or foe, the day of Italy's independence was sure and near. "Only yesterday," he said, "an English lady—I see her now in this room—gave me as an omen of good a translation of a noble poem by a great living poet, a German, which bids my country be of good cheer and expect her deliverance. Will you listen to a few lines? The German poet

reminds my country of the story of Penelope: how she was fair, and persecuted for her beauty, and how the reckless strangers reveled in her hall:

'Twenty years the purple tissue span she weeping on her throne;
Twenty years in bitter sorrow nurtured her beloved son;
Twenty years remained she faithful to her husband and her name—
Weeping, hoping, sending seekers—lo, and her Ulysses came!

'Woe to the audacious wooers when they heard the avenger's tread,
And the bitter death-charged arrows from his clanging bow were sped;
With the red blood of the strangers hall and pavement dripping lay,
And a fearful feast of vengeance then was held at Ithaca.

'Knowest thou that song, Italia? Listen, and in patience wait,
Even although the swarm of strangers throng through thy ancestral gate;
Rear thy sons to fearless manhood, though with many a burning tear;
Wait and hope; thy hour is coming; thy Ulysses too is near.'

To the closing lines he gave all the dignity, the thrilling force, the strength of pathos and of hope, which the words deserved, and which his penetrating voice, his noble earnestness, his expression, now animated, could lend. "It is," he added, slowly, "the poetry, the hope, the encouragement of a German! *Quod minime veris!* The sympathy and the hope are the more welcome, the more delightful. I accept the omen for my country, and I say to her:

'Wait and hope; thy hour is coming; thy Ulysses too is near.'

He remained for a moment motionless and silent, and the audience did not know whether he had finished or not; then his hand dropped upon the desk near him, and he bowed to the assemblage, and drew back from the front of the platform.

There was quite a cordial and enthusiastic demonstration of applause; and then began the rustling of silks, and calling of carriages, and the babble of talk with acquaintances, and the crowding on the stairs.

The moment the movement of departure began Madame Reichstein invited me by a look to come to her. She and Miss Lyndon had withdrawn into a corner a little out of the stream of the departing crowd. I made my way through groups of people and over trailing skirts to where they stood.

"How did you like it?" were Christina's first words; and then, without waiting for an answer, she said, "I wish to introduce you to Miss Lyndon—Miss Lilla Lyndon."

Before the ceremony of introduction was well through two or three acquaintances closed round Madame Reichstein, and Miss Lyndon and I were left for the moment together.

"Am I wrong, Mr. Temple," she said, "in thinking that we have met and spoken together before?"

"No, Miss Lyndon, you are quite right."

"That day in Palace Yard, when that poor man came up and stopped the carriage and called me by my name?"

"That was the day. You have a good memory."

"It made a painful impression on me, that scene and that poor man. I thought I could not have been mistaken, Mr. Temple, in you, when I saw you a few nights ago for the first time since that day. May I congratulate you now on your success—on the name you have won since I first saw you? It always gave me pleasure to believe that it was you with whom I had spoken that day, for you were kind to that strange poor creature."

This was a subject that somewhat embarrassed me; I turned to something else.

"The lines that Signor Salaris recited were translated by you, Miss Lyndon, I venture to think?"

"They were. Did you like them?"

"I thought them noble in spirit, and I hope prophetic; and they sounded to me—I have not seen the original—like a pure and exquisite translation."

"I am very glad; they are Geibel's. They seemed to me prophetic, and so I showed them to Signor Salaris. He is a noble creature, and I hope whatever he engages in may succeed; but I don't understand much of Italian affairs."

"Nor I, indeed, Miss Lyndon."

"Not you? And yet you ought to be at least a sort of step-son of Italy."

"I only know my step-mother's voice. Her interests she keeps for her own children."

"We are going, Emanuel," said Christina, who was leaning on the arm of some gentleman.

I offered Miss Lyndon my arm, and she leaned on it: I felt the pressure of her light touch, and I was thrilled by it.

"Do you know, Mr. Temple," she said, as we descended the stairs, "I have never ceased to think that there was some mystery about that man in Palace Yard which I ought to know, and that *you* could explain it. How did he come to know my name, and why did his face seem so strange, and yet so familiar to me? Will you tell me?"

"Pray, Miss Lyndon, don't ask me; I can not tell you any thing about him—at least not now; not without thinking over it. The secret, if it be one, may not be mine to tell."

"Then there is something?"

"There is."

"And he had some reason for knowing me and calling me by my name?"

"Pray don't ask any more. He had."

"I knew it," she said; and an unconscious vibration passed from her arm to mine.

"Some time, Miss Lyndon, you may know all; and it may be in your power to do good by the knowledge to people who are unhappy, and who don't deserve to be so."

She looked into my face, with surprise and deep interest in her clear pensive eyes.

Christina was already at the door of her little brougham waiting for us. I handed Miss Lyndon in. Christina gave me her hand without a word, and I saw a strange expression in her face, as if something had both perplexed and irritated her. I could not understand it.

Miss Lyndon held out her delicate little hand with a frank and friendly expression. I touched it, and the light pressure lingered long with me. As I left the place I felt like one on whom the first breath of some purifying and sacred influence has fallen. The presence of this girl had strangely affected me when first I saw her, and I had never forgotten the sensation. Now it filled me almost wholly. It was indescribable; at least, I can not describe it any better than by saying that while the presence of Christina seemed to allure me with the rich incense of flowers, that of Lilla Lyndon made me thoughtful and full of pure regret and humility, like the light of the stars.

In most stories of ghosts and demons and warlocks is it not sufficient to speak of the odious and supernatural creature in order to evoke his presence? Apparently some spell of the same kind haunted me this night. Miss Lyndon and I had spoken of the man who accosted her in Palace Yard; I had never seen him since my return from Italy. I had hardly got a dozen paces from the door of Willis's Rooms when I came straight on him.

Keeping the same side as you walk from Willis's Rooms toward St. James's Square, you may see as you look across the street a row of white and stuccoed houses on the other side, one of which has a fame attached to it. When I nearly fell over Stephen Lyndon he was standing on the edge of the foot-path, looking up at that particular house. He did not seem a day older than when I saw him last. He wore the black wig as before, and was rather better dressed than I had seen him on some former occasions, though not up to the mark of one memorable occasion when he came out resplendent. It seemed to me, too, that there was a little more of quietness and caution about him than was his wont in earlier times.

I did not know then that he was there waiting for me. So I felt vexed when I nearly ran up against him, and recognized him in the clear moonlight of a beautiful night, and saw that he had recognized me, and there was no escape without at least a parley.

"Good-evening, Temple," he said, in the coolest and easiest kind of way, as if we had met only the night before last; and he quietly laid his hand on my arm and stayed my going farther. "I have been contemplating that house over there; the first of the row. I have been meditating, Temple. An exile lived there once, my child of song—an illustrious exile. Where is he now, Temple? Only on a throne, my swan. There are exiles and exiles, Temple. Our patriotic and banished friend Salaris will hardly, I think, come to so brilliant a place. The throne for one conspirator, and the prison,

or very likely the block, for another. Crowns for the crowns that have brains under them; blocks for the blockheads. He is a gifted and touching blockhead, that friend of ours, Mr. Temple. I like him; but I was always a child of sentiment. I saw *you* in Willis's Rooms."

"Were you there?"

"I was there; oh yes. He and I, you know, are old friends. I saw Goodboy on the platform, and he saw me. I think he winced a little, but it was a lost fear. I have given up my notion of doing any thing with him in the way of street-scenes."

"I am very glad to hear it. I do hope you have turned decent and honorable and manly. Mr. Lyndon, there are many reasons why I wish you well."

"Thanks; I dare say. I really believe you, Temple; and I think you are a good sort of a fellow in your way. Yes, I am quite a reformed man. In fact, Temple, he was too much for me in that way."

"What way?"

"You never heard, then?"

"I have not heard any thing about you for a long time."

"True; you were away in Italian myrtle-bowers, and that sort of delightful thing. Well, I opened fire regularly on Goodboy; waylaid him at his door; pursued him to the House, to the Club, to the Opera. What do you think he did? He coolly took the bull by the horns. He gave me in charge to a policeman; he followed up the charge at the police-court; he delivered his version of the business with a dignified mock humility which quite touched and charmed 'the worthy magistrate.' He recounted all the things he had done for me, and all our venerable father had done; and it was a magnificent scene, quite. And do you know, Temple, while the whole thing was a hideous lie from beginning to end, there was not a word in it which was not literally true? It put me in an unpleasant light; that I must frankly confess. Well, there was nothing for me but to find bail—which of course I couldn't do—or be sent to prison, or pledge my honor to molest him no more—in that way. Temple, I was defeated. I had fought Respectability, and was overthrown! At least, I had the sense to know that I was beaten, and I surrendered and promised."

"I am very glad to hear it."

"Are you? So I dare say is Goodboy. But wait for the end. Do you ever read the Greek dramatists, Temple? I suppose not. Well, there is some good advice given by one of them about counting no man successful until you have seen the game all out. You just wait. If I detested Goodboy before, do you think I like him any better now? Do you know, the cunning old boy managed so well, that not a line of the business got into the papers; so that I had not even the satisfaction of bringing open scandal on him. I wrote letter after letter to the papers; need I say that no editor did me

the favor of putting the tale of the wrongs I had suffered into print? Well, there's enough of that. I have had rather a hard life of it since. Give you my word, I don't think any thing could have kept me up but my deep religious feeling and my determination to be revenged upon my enemies. I thought it well to retire from the metropolis for a little. I broke loose from my base, and marched right into the heart of the country—Liverpool, Manchester, and that sort of place. Coarse, cloddish, without soul, without humor, and, let me tell you, by no means green or awkward with the cards and the billiards. Ah, *mon Dieu!* it was hard and dull. No matter, I live! Providentially preserved, I still live! I return to town at last, led doubtless by my star. I find two of my old acquaintances established as lions of the season. You are one; my Carbonaro of Willis's Rooms is the other. Good Heaven, it ought to teach the vainest of us a lesson in modesty, when such people can be successful."

We were now walking round St. James's Square. We might have been mistaken for two dear and intimate friends. Lyndon was leaning affectionately on my arm, even when he was propounding lessons of humility drawn from the incomprehensible fact that such a personage as I had succeeded.

I thought of him then as I had thought of him always since our first meeting—as a hopeless old reprobate, whose inner nature no power on earth could touch, and whose utterly selfish and heartless levity could only be explained or excused by the theory that something not unlike insanity was mingled with his blood. Yet I now walked with him, listened to him, allowed him to lean on me, felt even a positive interest in his welfare.

Why? Was it for the sake of Ned Lambert and his love, and my sincere friendship for them both?

In sad sober truth, it was not.

It was because the thoughtful violet eyes of Lilla Lyndon the younger had looked into mine with kindly interest while she spoke of this man. The thought of her transfigured him in my mind. Nay, this miserable wretch was a sort of link between us. His very misery might be the cause of our meeting again.

And at this time I had no more thought of loving Lilla Lyndon than I had of falling in love with a saint or a star. I still believed that my life was to be forever shadowed and frustrated by hopeless unfading passion for Christina Reichstein.

I listened, then, to Lyndon's talk, and even encouraged him, and assured him I would save him if I could.

"Now that," he said, "is the very thing I am coming at. I really do think, Temple, that you are a sincere sort of person; and that you mean what you say. My daughter has disappeared somewhere; I can not find out where; and I don't suppose, you know, that it much matters, because I dare say the girl is hard up,

and drudging and toiling, and that sort of thing, and of course she couldn't do any thing for me. I should think Goodboy turned her adrift; he's quite mean enough for it. Well, you see, it's no use my looking her up. Do you know, I am so sensitive, and epicurean, and chivalrous in all my ways, that I can't bear to see women who are drudging and poor and overworked. It isn't the poetic idea of womanhood, is it? Women don't look as if they ought to be seen then. They get pale and washed-out-looking, and the plump outlines go, and their hands look dirty and needle-marked, and all the rest of it. No; I really prefer, as a father, not to see my daughter just now. You follow me, Temple?"

"I do," was my grim reply. Even the color of those violet eyes was fading from my mind as he talked in this way.

"You appreciate what I mean?"

"Quite," I replied, more grimly.

"Now, on the other hand, look at my niece. Aha, have I touched you?" I suppose I started. "There is a lovely girl, charming to look at; a little pale, you will say; but so very interesting, and with such an expression of goodness. Now, Temple, don't you think *she* could be brought to do something for me? Don't you think, at least, she ought to be allowed to know of my existence? I know it's kept a secret from her. I know she is ignorant of the tender tie that binds her to me. Now, Temple, my boy, here is your opportunity! You know her; you are in your own way a kind of success, and I dare say would pass off easily upon her—she's evidently very green and innocent—as quite a distinguished and delightful sort of person. I saw you handing her to the carriage to-day; you did the thing quite in good style; I dare say she wouldn't notice any difference. Now, *your* motive can not be suspected. Mine, I confess, is open to misinterpretation! Temple, do a benevolent deed. Here is an outcast uncle panting for love and redemption, and very, very hard up. There is a lovely niece, with her little bosom overflowing with family affection and benevolence and romantic nonsense of all kinds, and with unlimited influence over papa's purse. Temple, need I say more? You have a heart, and quite a presentable appearance. Bring us together, and look for your reward Above."

I managed to escape at last, without making a promise of any kind; but he squeezed my hand warmly, accepted a trifling loan, and went away humming a hopeful tune.

FISHING IN MISTS.

LOOKING through my blinds one October morning, to welcome the Orient sun, I saw in the sky no burnished shafts forthcoming, no golden glow outspread, but a misty, white veil, underneath which tears were falling to earth. The sun was weeping. He had chosen to weep veiled. Why he wept I can not imagine; for the moon last night had been her fair, benign-

nant self. But he wept, and his tears spattered and teased the earth.

I mean the earth's people. Inanimate things never utter that old, animate plaint against drizzly days. The trees like better the slowly, gently falling drops that come at intervals, and come with benedictions, than incessant, drenching torrents, I am sure. The flowers nod daintily, shake themselves coyly, at wary rain-woosers; but they rock with great tremors, they bow low from great weakness—poor little flowers!—when lovers take by storm what they could not win else. The meadow-grasses are fresher and sweeter, blither and sprightlier, after gentle rains. They are crushed and sodden after storms.

I know that the trees, the flowers, and the meadows like to feel the sun back of his grief. They get his tears, and his warmth too, and are glad that a cold deluge does not quite hide him. They like, and I, in spite of my animated existence, like, above all things, a warm, drizzly day.

Therefore, had I been a boy, had I been a little girl, had I been any thing less provoking to be than Miss Rebecca Thissell, aged seventeen years and a half, I would have given three rousing cheers and a tiger for the day. As it was, I merely contemplated it with a mild satisfaction becoming my condition, and made plans for its celebration without disturbing in the least the repose of my sister Jane.

I had just come home to supper in my vision, having passed a most delightful day wandering, in water-proof and rubbers, up and down secluded streets; finding little puddies to plash my toes in, little pools to set leaves swimming in, little eddies to whirl sticks in—having held my face up for the rain to kiss over and over. I had just come home to supper in my vision, and was about to commence the actualities of the day by leaving the window, seizing and donning my garments, pendent on a bed-post, when I heard the thuds of a spade below.

Though the grave-yard was directly opposite, I knew the lazy sexton wasn't at work thus early; so I accepted the more plausible theory that Fax was digging bait around the corner of the house. I built on the hypothesis a new and gorgeous vision. If Fax were digging bait, I would help him use it. If he intended to go fishing, so did I. If he should try to coax me out of it he should fail. I resolved that for once I would not be bought nor wheedled. It was one of my days, and out of respect to it I would assert my independent free-will. If Fax went fishing, I would go fishing.

The dignity of my resolution fired every effort I put forth, accelerated my dressing, hurried me down stairs, and into the back-yard, where the thuds were still audible, where I found Fax in his little rainy-day cap that always made me love him better—it made him so much handsomer.

He lifted his bonny brown eyes from the spade to me, and said, in that unbecoming tone of patronage that big brothers will affect:

"Run in out of the rain, Becky."

"Good-morning, Fax," I responded, in tones meant to be dulcet. "What you doing, dearie?"

"Extricating wo'ms from oblivion," he answered, seizing and squeezing a poor wriggler by the head.

Instead of slapping him for his cruelty, as I might possibly have done at another time, I continued to smile and propound innocent questions.

"Going fishing, Fax?"

"Do you think I'd miss such a day?" he said. "It's the day of days for fishing. Don't stand in the rain, Becky; you'll get cold."

"Get cold!" I exclaimed, unable to sustain my part longer. "You don't know me, Fax Thissell!"

"Oh! I beg pardon. Are you above such weaknesses?"

"I'm not a baby, to sneeze for this drizzle. I could be out in it all day without knowing the difference—as I intend to be."

"Picnic, Becky?"

"Fishing, Fax."

He understood me, though he affected innocence until I had explained, with greatest perspicuity, my intentions. Then the coaxing came. I resisted it. Then offers of bribes. I turned my back on them—and this was the dénouement: Fax dug an extra quantity of bait, and I prepared a double luncheon.

And by-and-by, after breakfast was over, after the remonstrances and persistencies had run their inevitable course, we started forth with our tackle and basket, chatting as harmoniously as if we had never had a discussion. For we were both philosophically inclined. I, triumphant, had no disposition to glory. Fax, defeated, had no disposition to grumble. So we talked of jolly things on our way to the lake.

For instance, Fax congratulated me on my apparel, which, excepting my straw turban, was water-proof and rubber, and I returned the compliment by admiring his little cap and big boots. And then we united in extolling the day. Then Fax told me how sorry he was that he must go back to college next week and leave me. And I told him how sorely I should miss him. As Fax expressed the affection for me that I knew was in his big heart, I ventured to ask a question that had been puzzling me all the morning.

"Fax," I said, "what is the real reason why you don't want to take me fishing?"

"The real reason, my dear! Haven't I told you a hundred times that the fearful responsibility of exposing you to squalls and sharks, vapors and duckings, cancels the pleasure I should otherwise experience in your company?"

"Nonsense, Fax! Please tell me truly. I want to know the selfish reason."

"You don't believe in my disinterestedness, Becky?"

"No, you humbug!"

"Well, you Yankee, if you will know, it's *baiting the hooks*."

"Fax!" I cried, disgusted with his selfish-

ness, "you've baited the last hook you'll ever bait for me."

Fax laughed incredulously.

"You see, Becky, I know your sex so well."

That brother of mine had only lived twenty years; but oh, he knew our sex so well! Marvelous students of woman nature are these students of text-books in college halls! An alarming and tremendous thing is that volume of stale statistics they fondly hug!

"I know your sex so well! There isn't one of them that can be depended upon in any thing. You take a young lady fishing, *par exemple*, and she never discovers that her hook wants baiting until you're hauling in your biggest fish; then she frightens him back in the water telling you of it. And then, though they catch so few fish, they consume the most astounding proportion of bait."

I never said a word to my ugly brother in retort, but just treasured up all my wrath for future outpouring. He gave me his hand to help me down the declivity that led to the water. But, instead of taking it, I leaped and ran to the very edge, which frightened him so that there was not a drop of my vengeance left. I considered him fully paid.

The old sailor who kept the boats sat rocking in one of them. Now I never saw him doing such a thing on a rainy day before in my life. Though he had weathered so many storms in his hardy young manhood, sailing the big blue seas, when old age came on he anchored. His final port was our little inland village. There, in the wee house on the shore, he had sat and rented boats, warding off draughts and influenza with huge wrappings, as meekly as if he had never been a daring, dashing lad—for many a day.

Apparently the old man was under some distracting influence. It flashed into my head that he might fancy the young days back again—for his mind was errant at times—that perhaps he thought that little boat was one of the old prizes, and that he and the elements were waging one of their old fights for it.

Before I could express my rather absurd ideas to Fax, the old man spoke, and we saw that the person whom he addressed was waiting for him to untie the little boat. And after all that was what the old man was sitting out there in the rain for.

The man who waited stood on the end of the little pier, and I want to notice him standing there, because except for him I should have no story to tell.

.....Let me first insert an apologetic paragraph in behalf of girls aged seventeen and thereabout. I look into the teens of girlhood and what do I see? Susceptibilities. Not much else comparatively. Susceptibilities constantly wrought upon by influences of good and evil. That young girls who read romances then are romantic; that fictions awaken desires for, and absolute credence in, parallel realities, is not strange.....

I had spent my last evening in the depths of a rocking-chair devouring a novel. Its hero was tall and stalwart, erect and kingly. So was the man on the pier. The hero came into the book with folded arms and downcast eyes. So the man stood looking into the lake. Of course I identified him with that last hero, with whom I was just a little bit more in love than with his immediate predecessor. I was always a little deeper in with the last than with the one before him.

The concurrence of events caused my credulous, silly little heart to palpitate with the joy of conviction. Here was what I had trusted in so long come at last—the hero from a book had come into my life beyond a doubt. Skepticism might prevail, but I was brave enough to believe in the dear old creed of counterparts. There stood mine. I resolved upon a flirtation.

The old sailor stepped out and bade us good-morning. The man on the pier stepped into the boat, pushed off, and rowed out through the grasses into clear water, without raising his eyes to the shore or us. He did not even glance at me. I was piqued.

"Why," said Fax, "he has taken our boat."

"Did you want that boat?"

"You know I always want it. I thought I'd be here early enough to secure it this morning."

Out beyond and around the long pier went the coveted green and white stripes of the *May Queen*. Fax, sulkily withdrawing his gaze from them, selected a dingy lavender, put me in one end of it, the tackle in the other, and sat down between the oars.

"I'm provoked about that boat, Becky," he said as we floundered in the grasses. "It doesn't seem like home in any other. What a queer fellow that was that took it, any way!"

"Queer?"

"Why, I don't believe he saw us at all, though we stood close by him. He was bound we shouldn't see him, at any rate. That big hat he has on is a regular extinguisher. What's become of him?"

"See, he's drifting!"

Through the thin, misty rain we saw, as in a picture, the man and the boat. He had dropped his oars that he might assume the old attitude. His arms were folded and his eyes were still downcast. Scarcely moved by the tide—which was hardly a tide at all that day—he fathomed one low wave, on which his eyes were fastened.

"Making plummets of his eyes, isn't he?" said Fax. "Wonder if he's getting the lake's dimensions."

I made no answer, but watched him, and in doing so I seemed to lose gradually the reality I had fancied secured; for the mist became momentarily denser, the rain fell faster, and fainter than the outlines of imagination grew the outlined living picture yonder. For a minute he left me, and in that minute the skepticism named practicality had a new proselyte. But the sun smiled, dried up the rain, and the im-

movable figure, mist-enshrouded, downward-gazing, reclaimed me.

I seized the rudder. Fax was lost in a little reverie, and, rowing mechanically up the well-known route, he did not notice that I turned the track of our boat very near the track of the other.

"Becky!" he exclaimed, waking up as the boats almost grazed, "where are you going?"

"Fishing," I answered, leaning forward boldly to catch a glimpse of the hidden face, and noticing, after my failure, fishing implements in the *May Queen*.

Vae victis! There was not a responsive sound or gesture. Chagrined beyond expression, a little frightened, too, I dropped the rudder and let Fax row me swiftly up the shore.

Beyond the banks, beyond projecting beaches white with shells and pebbles, beyond great clumps of shoreward-tending trees, dipping, for pastime, their green leaves in the green water, on and on Fax pulled us with great strokes, and close behind us pulled the man who saw not banks, nor trees, nor beaches.

Fax was noticing now, not me, nor the shore, but the man. Throwing down his oars, he suddenly thrust his head into my face, and whispered:

"He's followed us long enough. I've a mind to thrash him on the spot."

"You'd better," I said, "and drown us all. I think it's fun. Let it go on."

"All right," he said. "Let it go on then."

Plying his right oar vigorously he turned us out into the lake. Straight for its centre we darted. Straight for its centre the man followed. Plying his left we came shoreward again. Shoreward came the man. We cut right, acute, and obtuse angles. We made arcs and circles; ran with the waves, against, and across them. We danced, skipped, and played antics innumerable; and wherever we went, whatever we did, the *May Queen* did likewise.

Finally, after a long time spent in the exhilaration of this strange sport, Fax folded his arms from exhaustion. Only too glad of a pretext the man refolded his, and, having not yet lifted his eyes, there was my hero again, very near us. If at first the pursuit had flattered me, the recollection of it now filled me with a most intense curiosity and apprehension. Who was the pursuer? No longer the one I had fancied him, no candidate for flirtation—who was he?

I could find no answer in the lineaments I scrutinized, and even while I sought it he took up his oars and left us behind him. Perhaps he thought we were ready to resume the game, letting him lead it; but Fax, proud as he was of his muscular endurance, could not match this dauntless unknown. So we rested a while, and watched him crossing the lake.

"Now, Becky," said Fax, "what is the meaning of all this? My only solution is unmitigated impudence."

"I don't think it's that, Fax."

"What then?"

"I'm sure I don't know."

"Well, being rid of him, suppose we prepare to fish."

Speculating and laughing about our adventure we peacefully sought our destination. The spot Fax chose was not far from shore. Above it was covered with ripples; underneath, Fax told me, it was lined with rare fish. As Fax took one pole I took the other.

"This is your pole, Becky," he said.

"Give it to me, then."

"Why, I'm getting it ready."

"I can get it ready myself. Give it to me, or I'll keep this."

"Oh no!"

"Oh yes!"

"You can't bait your hook."

"I can."

"Well, you won't."

"I will."

Now, though Fax and I had been taught, from babyhood up, that contradiction is unrighteous, we indulged in it sometimes, nevertheless. Both bent on conquest, we embraced our respective poles and endeavored to stare each other out of countenance. The pantomime ended in uproarious laughter.

"Now, Becky," said Fax, "you know I wouldn't have said what I did if you hadn't forced it out of me. I'll take it all back, and do penance by baiting your hook."

"You sha'n't do penance for my sake!" I exclaimed.

"Then grant me, as a token of your forgiveness, the overwhelming felicity of baiting it."

"Fax," I said, with a solemnity that could not fail to impress, "if you should beg from now till December I wouldn't yield one inch."

Fax, knowing me, knew that I meant what I said; so, removing the cover, he gravely passed me the tin box crowded with that writhing mass of life.

"Inexorable maiden, partake!" he said.

And I, imitating the illustrious Jack Horner—with, oh, what different emotions!—put in my thumb, and pulled out one, only it wasn't a plum, and I put in one finger besides. My dainty white thumb and forefinger into that vileness!—I, who had spent a good portion of my seventeen years in fleeing from angle-worms and such infamous reptiles, not to mention four-footed beasts, took into my hand one of the things! How pale I must have turned—and Fax was looking! My sensations are indescribable; but I held him bravely, and when he tried to crawl away I pinched him.

Taking the worm, however, was only the preface to my horrid experience. He was bait, and bait is made to push hooks through. Moreover, he was an existence—a living, moving being. This live thing was to be murdered, and, in its death agonies, to be strung on a hook! Why, I would almost as soon have broken in two and pierced a kitten or a baby! But, feeling my brother's eyes on me, I did it.

I murdered the worm. I made of his lengthy unit fractions. I divided him into two pieces.

"Becky," said Fax, in a tone of the deepest commiseration, "please let me do it, dear. I've done it so often that I don't mind at all."

He saw, then, how I minded. Not answering him, I laid one half back in the box, and, despite the other half's contortions, encased my hook in it, successfully concealing the point, as I had often seen Fax do, in its head, or tail, I know not which. Then I extended my pole and dropped my hook.

A bite! What a thrill that jerk under water, so dear to fishers, sent through me! It was a big jerk, but such a little fish—not more than six inches long! Instinctively I handed it to Fax; but, remembering in time, I pulled the hook out of its mouth myself. And then, touched by its puny, homesick look, I threw it back into the water. I pulled out and threw in half a dozen of those good-for-nothing little things; while Fax brought up such fine, fat fellows. But by-and-by I began to have luck. I rivaled Fax.

"*Tempus fugit* like a mice," said Fax, pulling out his watch. "Guess what time it is, Becky."

I guessed twelve. It was two. One never realizes how time can fly when one is having luck with fish.

"I'm hungry," said Fax, and forthwith producing our luncheon we let the fish rest while we rested. We sat there, talking idly over our sandwiches, discussing the man again, *et cetera*, for a long, delightful time. Then we commenced labor. I had pulled up several long, smooth fish, when I felt such a bite as I never felt before.

"Fax," I said, "I believe it's a whale."

"Where?"

"On my hook."

"Is it heavy?"

"Awfully."

"Steadily, carefully, Becky."

I tugged with all my might, and felt it slowly rising, rising. Breathlessly we waited. Joyously we shouted when it came above water—that mammoth, emerald beauty, flaked with white and jetty scales. That was a fish to boast of and remember. Clasping him tightly with one hand I endeavored, with its tremulant mate, to remove the hook. My obstinacy was simple barbarity; for, without Fax's assistance, I could only torture the struggling creature. It was impossible to let go his body and have my left hand free to pinch the big head and facilitate my efforts. Forgetting in my eagerness how to be scientific, still vain and willful, and at length despairing, I shut my eyes and pulled. The hook was freed; but it had torn its way out through flesh and blood. I had made two long, frightful gashes down and across the poor thing's cheek. I had made my beauty bear the mark of a cross. Half crying with remorse, I loosened my hold unintentionally. There was a sudden lunge, and my fish had taken French

leave. He had gone home to the bosom of his family.

As soon as we had recovered a little from our exceeding disappointment we noticed, what we must have noticed before except for our utter absorption in the fish episode, the striped boat and its occupant near us, near enough to have seen and heard all that transpired. He had come up, of course, in the midst of our excitement, and, sitting with his back to us, was now tranquilly baiting a hook.

"Fax," I said, in my lowest whisper, "don't let us stay here."

"Stay!" he retorted. "I will stay, and make that thing, whoever he is, leave."

"He has a right to fish here if he chooses," I said. "Please go."

So we rowed off and left him there in our place, and, having a fine display of fish, it being also late in the afternoon, we rowed homeward.

"Who is that man that has the *May Queen*, Mr. Gowl?" Fax asked the old boatman, as we landed.

"Who is he?" said the old man. "Can't you tell me that, Mr. Thissell? He's a queer one, I reckon," shaking his head ominously.

"Did you ever see him before?"

"Not him, nor the likes of him. He never raised up that hat while he spoke to me, and the only words he said was to bid me put a fishing-rod in the *May Queen*. He gave me a handful of silver beforehand too. See here."

And he showed us the extravagant price which the stranger had paid for the little boat.

All the way up the long street that led to our home Fax and I still speculated about the man. Shadows draped the square old-fashioned house when we reached it. Night was coming on, and the moon would rise late. We carried our trophies around into the back-yard, and through the dining-room door. My sister Jane shuddered, sniffing the dampness we brought in. She was getting tea. Jane, the exemplary *fiancée* of a clerical widower, had so far condescended as to make tea for us.

"Where's Ann?" said Fax and I together.

That something ailed Ann we knew, or Jane would never have left her ruffling and tatting to go into the kitchen.

"Gone home," said Jane, disconsolately. "Her mother was taken with chills, and sent for her. And, Fax, Neil is in the library."

"Glory, hallelujerum!" said Fax; "he promised to come some night this week—the dear old boy! and I'd forgotten it."

With that he dropped his fish and started, in his wet clothes, for the library.

"He is going to spend the night with Fax, Becky," Jane said. "You had better go right up stairs and dress for tea."

Before her advice was delivered I was already half-way up the back-stairs, and in the course of twenty minutes I had made myself beauteous as Nature would permit, in Bismarck and blue. Neil was fond of blue, and though

scarlet was my color, I could afford to become an immolator to his taste; for I liked Neil. Next to that long line of dear, shadowy heroes I liked Neil better than any body.

What a picture I saw as I entered the library! I used to think the cozy, luxurious room, with its book-lined walls, a picture in itself. But it was merely the setting now for a choice grouping—my mother, Neil, and Fax. Neil's head, adorned with those strong, manly features, was thrown back against the great chair he sat in, and his eyes were resting on the face of my little mother, who stood talking to him, with one hand on his shoulder—for mother liked Neil too. She pitied his motherlessness, and was then, I doubt not, doling out to him sweet morsels of comfort. Around Neil's other shoulder Fax's arm lay. He sat there still, on the arm of his chair, in his wet over-coat, quite absorbed in the "dear old boy."

I opened the door and spoiled the picture; for Neil rose to welcome me. Though mother and Fax were so near, I declare, as he held my hands in that long, firm clasp, he looked something into my eyes from his that I had but seen shadowed there before. Pouring that ineffable something down into my soul only, the others may not have seen the transmission. As for me, it made my heart throb with an unknown ecstasy. It made my lips quiver and my lids drop to meet the uprising flush in my cheeks.

But I recovered immediately, and, ashamed that he should so easily have found in me what he sought, I left them all, and flung myself on an ottoman by a far-away window, and commenced to jabber flippantly about the most commonplace things. Neil, quietly resuming his seat, which Fax had at length abandoned, fixed his eyes on my face, and listened.

Fax went to exchange damp clothes for dry. Mother followed him. Afraid to hear the voice which I liked so well, I would not cease talking, and, not knowing what else to say, I commenced to tell Neil about our day. He left his seat and came over by me. I do not think that he once took his eyes from my face. He sat down so near me and watched me so intently that, in my new, strange servitude, I dared not look up. The bondage, in a certain way, annoyed me; and yet I believe I was wearing one of those yokes that to women bring not fatigue and pain, but exaltation and peace.

Looking at the carpet I told Neil the whole story. It must be because his great, truthful soul, overshadowing him, made detraction impossible that I did not withhold that about the heroes; for I told him every thing—how I had watched for them; thought one come at last, and been disappointed. I finished my story. He bent over me, folded tenderly in one hand of his the two clasped on my knee.

"Poor little girl!" he said, in those perfect modulations that made his commonest words musical. "Poor little girl! I'm afraid her hero will never come."

The door opened, and Jane announced sup-

per. Mother and Fax came down, and we gathered around the table.

"Poor little girl! I'm afraid her hero will never come." The words were in my ears during the liveliest sallies and repartee we indulged in that night at supper, as well as during the few short pauses. The pity in them that would heal disappointment's wounds; the tolerance that humored, instead of ridiculing, my foolish young dreams; the implied seniority of experience; the looking back from a long distance to be sorry for—made me hate those heroes of mine, every one, from that time henceforth.

"Who is going to clean these fish?" said Jane after supper.

"Bother take Ann's mother!"

"Chills are bad enough, Fax."

"You had better throw them away," said Jane, indifferently.

"Throw them away!" I looked daggers at her. "I'll clean them all myself first."

"You won't do that, Becky," said Fax, "because I'll take the job out of your hands. I've cleaned fish before, and I can do it again. You can help, though."

We unbuttoned our cuffs and rolled up our sleeves. Neil was talking to mother again.

"Neil," Fax said, "Becky and I are going to clean fish."

He started up. "You'll let me help?"

"Shall we, Becky?"

"No; he may be spectator."

"All right, however you decree."

"Neil, suppose you read to us while we work."

"Oh yes!" I cried.

Neil would be delighted.

"You hunt up a book, Neil, while we get ready," Fax said.

"What sort of book shall I bring, Miss Becky?"

"Oh, any thing you choose."

"Provided it's Tennyson," remarked Fax. "Becky gets on the 'mild-eyed melancholy' over the 'Lotos-Eaters' semi-weekly, and it's my firm conviction she doesn't know another poem in the English language."

"You may read the 'Lotos-Eaters' if you please," I said to Neil, and chased Fax into the dining-room with evil intent.

"Here, child," said Jane, chasing me with an immense check apron.

I put it on, pinned up my trail, and commenced operations by seizing the biggest tin pan I could find.

"That's right," said Fax. "That will do for the first water. Find a second edition for rinsing water, Becky."

I seized another, and placed it by the side of the first on the dining-room table.

"I hope you don't expect to clean them in here," screamed Jane, showing the whites of her eyes fearfully.

"Come into the kitchen, then, Becky," Fax said, marching off with the pans.

"Nor there, either," shouted Jane, pursuant, "for Ann won't be home to clean up after you."

"Thunder and Mars! Where shall we go, sister Jane?"

"You can't go any where. I tell you you had better throw them away."

"Jane," I said, sternly, "we'd sooner clean them in the parlor."

"Becky!" exclaimed Fax, "the hen-house!"

"Oh, Fax, what a brilliant thought!"

I clapped my hands. It was a palatial hen-house, into which no hen had ever yet set foot. It had only been completed a few days, and was waiting for a family to move in.

"Now, Becky," said Fax, elated with the sudden turn affairs had taken, "we'll have a jolly time over these fish. You bring the pans and a big lamp, and I'll carry out chairs and improvise some sort of table."

The quadrilateral hen-house was a lattice-work structure, its only substantials being the roof overhead and a door on one side. When we brought in the lamp the interior became an illuminated theatre for outsiders. As we lived some distance from the densely habited part of the village, and as the night was likely to draw few people out of doors, the fear of being discovered and watched did not disturb us.

Neil came with Tennyson, and helped Fax bring in planks and sticks of wood. Having laid the planks across the sticks, we were supplied with work-table and bench. This article of furniture was placed close to that side of the hen-house opposite the door. On one end of it Fax sat, on the other end I sat. Between us were the pans, the fish, and the carving-knife. In front of us, with his back to the door, was Neil on a low chair. On a high chair above him stood the lamp, last mentioned, but by no means least important, of the cast within, who took and played their rôles unwittingly.

Thus disposed, Fax cut and scraped, Neil read, and I patiently waited for the fish to pass through the first water and get ready for the second.

Not wishing to look at Neil, I looked beyond. As I expected, I saw on the other side the lattice-work nothing but darkness—for a time.

The cadences that brought from the printed pages to my ears the lulling words of the "Lotos-eaters" would, if any thing could, have calmed the turbulence within me. But the man, the wounded fish, the new hatred of the heroes, and the intoxication of which my soul had partaken, had infused me with a sort of nervous expectancy that would not be calmed.

"And deep asleep he seemed; yet all awake,
And music in his ears his beating heart did make,"

Neil read, drawing, with a glance, my eyes inward to his. I let them rest for a time where they had fallen, and while Neil read at me I looked at him.

"How sweet it were, hearing the downward stream,
With half-shut eyes, ever to seem
Falling asleep in a half dream!
To dream and dream like yonder amber light—"

Looking out I saw in the darkness two amber lights gleaming.

"See!" I cried.

The boys started.

"Pooh!" said Fax, "it's only a cat. She smells the fish. I'll open the door and let her in."

But my scream had frightened her away. She came creeping stealthily back in a few moments, however, smelling her way, through the open door, to the fish. She was a genuine night-prowler. Originally of gigantic proportions, her ill-gotten gains had developed her into a sleek, beautiful queen of cats. Fax threw her the refuse bits of fish. Regarding them disdainfully, she crawled under our bench, raised her proud head, lit with those burning balls, and from between her white little teeth emitted demoniac hissings. In a second she came out. She stood erect, snatched from the pan a newly-cleaned fish, and vanished once more in darkness.

"What a cat that was!" said Fax, returning from the door—which he closed—with carving-knife in hand. "As fine a feline specimen as I ever saw."

The last words that I remember in that memorable poem are these:

"—come like ghosts to trouble joy."

They are not the last that I actually heard, but I lost a few subsequent lines in thinking about them; and when I was ready to listen again my attention was drawn from the poem to a spot by the door. Distinctly I saw, not a cat's height but a man's height from the ground, two fiery eyes looking through the lattice. I did not scream. I did not speak. But how could I listen to poetry with those eyes fastened on me?

In my heart of hearts I believed that I was deceived; that my brain was upset, and a cruel hallucination tortured me. Nathless the eyes enchained me as pitilessly as if I had known then how real they were. I could not bear the smiles, ineffectually concealed with pity, that would surely come on the boys' faces if I were frightened at nothing again. Not daring to tell them, enduring an agony of suspense, I looked at those eyes whenever they looked at me. For three times they ceased looking and moved behind the door. During that third abatement of torment Neil finished the poem and closed the book.

I was conscious that he had finished, and that any unusual emotion depicted on my face would be noticed now; so I laughed—at nothing, of course—affected an uncommon jollity, and talked of the fish.

"What progress you make, Fax!" I said. "Aren't they nice, big fellows? Oh, Fax, my lost beauty! I wish we had him."

I had scarcely uttered the words when the door of the hen-house was jerked violently open, and my wounded fish, as he had plunged from my hands to the water, plunged from a mysterious somewhere to my feet.

We heard a wild scream, a rustling of leaves, the slamming of the gate. For a second we all stood transfixed, then Fax rushed into the yard. Neil was following; but he turned and saw me trembling with fear.

Could he have helped, I wonder, coming back and sheltering me with his strong arms then? Could I have helped welcoming the shelter? Could he have helped whispering, "I will never go away unless you bid me?" Could I have helped answering "Stay?" Not in the desolateness of that night, when it was so sweet for him to give and me to receive protection. But we might have retracted in the morning. Only we did not choose.

Fax returned from an unsuccessful chase, greatly excited. He found us calmer; for a peace had come to us that quelled fears.

"Becky," Fax said, bending over the fish, "come here."

I obeyed.

"Do you see that mark?" pointing to the cruel wound—the gaping cross.

"Yes."

"Is there any mistaking it?"

"No."

"So it bit again for that stranger, and he has brought it to you." Fax looked troubled. "It is very queer."

And that was all we could say—mother, Jane, Neil, Fax, and I. It was all we could say through the long evening while we talked it over. But the next morning the light dawned.

"Read this, Becky," said Neil, at about eleven o'clock A.M. on the following day, handing me our weekly paper, which was just issued.

I read:

"An inmate of — Lunatic Asylum, a tall, finely-built, muscular man, escaped from his keepers three days ago. He employed a most skillfully-arranged plan of escape and concealment. Was traced to this village. After spending the day on the lake, in a boat of Gowli's, known as the *May Queen*, he went at night to the wood half a mile beyond the late Dr. Thissell's premises, where he was captured early this morning."

"Exit Becky's hero," said Neil. "The end of act first."

"Why," I laughed, "you forget that we're in act second."

"How charmingly the plot unravels, Becky!"

Of course I shrugged my shoulders.

THE BUTTON-HOLE BOUQUET.

I.

DON'T say things are trifles till you know whether they are or not. Have you ever looked back on your life and been astonished to see that some little thing has been the means of changing the whole course of it? I can tell you a little story of the fact of a cat running across the yard with a chicken in her mouth causing a deal of suffering to two young people—to say nothing of the chicken's feelings. If you will listen I'll relate it.

VOL. XXXIX.—No. 230.—18

Nell Manning was a bright, loving body, the daughter of a worthy old couple who were "uncle" and "aunt" to the whole neighborhood; she had a warm, sympathizing heart, that caused her to feel a deep interest in her friends' love affairs, though as yet she was heart-whole herself, and seemed likely to remain so. One of her dearest friends was little Maggie Brown (the heroine of my story), a shy little shrinking thing with two lovers, both fine young fellows. One was Tom Harding, for whom she only cared in a sisterly sort of way, and treated tenderly because she was sorry she didn't care more for him. The other, Fred Bailey, was the joy of her heart; but she was too shy to give him more than the briefest glimpses of her feelings, so that poor Fred was in a more uncertain state than Tom, who did hope a little, and even more than a little.

It was Nell's birthday, and Nell was going to give a party; not a city party by any means, but a little country gathering. Of course Tom and Fred were invited. Maggie spent the day with Nell, helping her to frost the cakes and finish up various little matters of the sort; and then the two went into the gay old-fashioned garden, where bright flowers abounded, and gathered their aprons full for the adornment of the tea-table. Maggie had but little skill in the arrangement of flowers, though very fond of them, while Nell's quick fingers could group them charmingly; so when they came into the cool sitting-room Maggie poured her gatherings on a large waiter by Nell's side, and looked about for a resting-place. Now the room had but two really comfortable seats in it. One was the roomy sofa where Nell was seated with the waiter of flowers by her; so that place was pretty well taken up, for Nell was a fine specimen of a young woman; and the other was Aunt Peggy's easy-chair, styled "Sleepy Hollow," which stood by a window. It was Aunt Peggy's usual custom to sit therein and gaze out, occasionally sinking into such deep thought that her eyes were quite tightly shut during the meditation: but now the chair was vacant.

"Mother has gone out about something," said Nell; "sit down in Sleepy Hollow and rest a while, so as to be fresh for this evening"—a piece of advice that Maggie took forthwith.

Nell went on with a stream of conversation that was entirely on her own side, and in the midst of other matters gave this bit of information:

"You see I am going to put a little bouquet on each lady's plate—isn't that a pretty idea? I saw it in a book—but I am going to make yours different from the rest. I know somebody that you know that likes to wear a knot of flowers in his coat button-hole; so in the centre of your bouquet you will find a few moss-rose buds fastened by themselves, and arranged so that you can draw them out without pulling the rest to pieces—that's a real cute thought of mine, and I'm proud of it. Now be sure to

give it to him. I shall tell him to expect it, don't you disappoint Mr. F. B."

And then she talked away about something else.

Alas! Maggie had not heard. A little tired and rather heated, Sleepy Hollow and the cool room were too much for her; she sank into a brief slumber. Her nap was a short one, but quite long enough to do the mischief. She didn't hear a word about the bouquet. Now comes in my proof of trifles.

Had Aunt Peggy been in Sleepy Hollow Maggie would have staid out, and she could not have sunk into forgetfulness in any of the other chairs. But what took Aunt Peggy out of that bewitching nook? The cat running across the yard with a chicken in her mouth. Young chickens had of late disappeared mysteriously. The cook accused the cat, but Aunt Peggy said puss should not be convicted on any thing but the most direct proof; she turned up her nose at circumstantial evidence; but here was a proof the most conclusive. Aunt Peggy's eyes were good, and she was sure that she beheld the perfidious cat with a little yellow ball of a chicken partly out of her mouth; besides, there was "Old Speckle" herself charging after the enemy with her feathers ruffled to the last degree, and followed by her piping brood screaming at her heels. Out trotted Aunt Peggy to condemn the offender, and so Sleepy Hollow was empty, and Maggie sat in it and slumbered, and finally came to prolonged sorrow of heart because of this chain of circumstances.

One might well fear to step at all were it not for the watchful, loving Lord above, who turns troubles to our good; for, after all, Maggie's sorrow developed her character and made her more than she would have been had her life been without a cloud.

Later in the afternoon behold Nell and Maggie, lovely in their fresh muslins, receiving and entertaining the guests, among whom flourished Tom and Fred. Just before going in to tea Nell managed to draw the latter aside, and told him of the button-hole bouquet of moss-rose buds, which made the young man glow with delight, and give Nell a look of rapture that did not make her stout little heart flutter a bit, because she knew that he saw nothing but Maggie's face in the midst of moss-roses, though at that moment Miss Maggie was on the piazza with some young ladies and Doctor Blythe, who afterward made her more trouble than either she or he thought of. Doctor Blythe was a dapper little body, full of fun, and rather fond of practical jokes, never losing the least opportunity in that way.

At the proper hour the party filed into the tea-room, where Aunt Peggy sat at the head of the table, beaming smiles of welcome on all, and flanked by two stout domestics, who were all readiness to hand about delicious cups of tea and coffee, and the more substantial parts of the entertainment. Nell saw her guests well disposed of, and managed to have Tom at a

good distance from Maggie, who had been escorted in by Fred. Much laughing and talking prevailed; if there was not much wit, there was plenty that passed for it, and that answered all purposes. In the midst of it all some one called out to Fred,

"Why, Fred! I heard this afternoon that there was an idea of your going to China for several years, and that you were to start at once. Is that true?"

Maggie's heart gave a great thump, and she listened breathlessly for the answer.

"My uncle does wish me to go. I had a letter from him to-day, and am to decide by Monday. If I go, I must start for New York then and sail on Wednesday; but I've not quite decided yet."

"Dear me!" said Aunt Peggy; "that is short notice; to get the news on Saturday and have to say yes or no by the next Monday. The young folks will miss you a deal if you go, and so will the old folks too."

Here arose a general chorus protesting that he must not go, they could not spare him—all joining, with the exception of Maggie, who couldn't speak, and Tom, who wouldn't; for Tom, with all his hopes, had an uneasy feeling that, although he would miss Fred quite as much as the rest, it would be in a totally different manner; therefore he thought it would be as well for Fred to improve his knowledge of geography and gain some information in regard to China and the customs of its inhabitants. In the midst of the talking Fred managed to say, in an under-tone, to Maggie,

"Somebody else will decide for me. If I get the button-hole bouquet, I'll understand that means *stay*. Don't you think I ought to have it, when it was made on purpose for me?"

All which was Greek to poor Maggie; and she did not dare to ask an explanation, for her breath was coming and going in such a fluttering way that she knew she would not be able to control her voice. So she sat mute, while many of the others were eagerly talking to Fred; and Tom, regarding her from a distance, was sure she would have preferred having *him* by her—Tom being possessed of a good share of self-conceit.

When tea was over they flocked back to the parlor, where dancing soon commenced. But things did not go well with the unfortunate lovers. Fred had jealousy and obstinacy tolerably well developed on his handsome head; and these undesirable bumps just at this time rather ruled over the other bumps; the consequence of which was that he determined that he would say no more till Maggie made a move and gave him the flowers, or told him she would; while she—poor little dear—would gladly have gratified him had she known at all what he wanted; but she was far too timid to ask him. Then Tom took possession of her, and a silly little flirt got hold of Fred—a girl he didn't care a fig for; and the two (Fred and Maggie) were

about as miserable as any other two would have been under like circumstances.

At the close of the evening Maggie stood near a window with a young friend, a delicate girl, who looked with admiring eyes on the bouquet Maggie held in her listless hand, and exclaimed:

"Oh, what lovely moss-roses!"

"Would you like them, dear?" said Maggie.

"Take them home with you."

Poor child! she was sick of the flowers and all else. The young girl took them with delight; and her brother who was standing by, tall Ned Stone, said, "I'll put them in the buggy for you while you get ready, Mary." So Mary handed them over, and Ned bore them carefully away, for he was a jewel of a brother, and his delicate sister was the apple of his eye.

Now Doctor Blythe was out on the piazza cooling himself after a rather vigorous Virginia reel. In the clear moonlight he saw Ned deposit the flowers in a basket in the back of the buggy, after which he returned to the house. Here was an opportunity for the Doctor to indulge his fondness for practical jokes; so he quickly made up a bouquet of grass and clover-heads, which he popped into the basket in place of Maggie's flowers, depositing those in his sulky, which he had with him on account of having a patient to visit after the party. Great was the wonderment of Mary and Ned when, on reaching home, the substitute was examined.

Maggie and Fred parted without any explanation; but each was consoled by a secret hope that the morrow would rectify all mistakes. Fred arose the next day in a better state of mind. He felt ashamed of his feelings of the night before, and determined to seek Maggie and tell her all his hopes and fears. Yes, he would sit by her in the choir where she sang so sweetly, and then afterward would walk home with her; and then, *then*, speak directly to the point. So he dressed with great care and started for the church. The sky was bright and cloudless, and the sweet influences of nature, together with those of the holy day, softened and quieted the young man's heart; he thought of what his life would be could he gain his Maggie, and how good and gentle she was, how tender and winning. He carried his thoughts of her into the church—in which he made a mistake, for they should have been raised to more heavenly objects. But he did as we are all too apt to do. Ascending the choir stairs he reflected, "Yes, indeed, I might have known she would not have had the courage to give me the flowers, my timid little Maggie."

By this time he was just entering the choir, and raising his eyes beheld Maggie seated with her back to him, and apparently listening to something Tom Harding was saying to her, Tom bending tenderly over her to do it. Fred gazed at the pair, jealousy beginning to awake. While he did so Tom straightened himself, and Fred was transfixed by seeing in the button-hole of his coat the cluster of moss-rose buds.

There was no mistaking them. He not only recognized them, but besides that, Nell was the only one in the village who had them, and she had told him that she cut all she had for Maggie's bouquet. These thoughts passed like lightning through his mind, and brought such certain conviction with them that he instantly turned, and descending the stairs made at once for his own abode, where he remained the rest of the morning, tortured by disappointed love and raging jealousy.

Now, the offer of his uncle was considered with far different feelings. He looked on it as a means of escape, and decided to accept it. Having no relative but his uncle, a rather cold person, of whom he had seen but little, he had no family ties to prevent his leaving his country even so unexpectedly. Before, he could not bear to leave the place where Maggie dwelt; now, to remain was wretchedness; so his resolution was taken.

But how did Tom get the flowers? Of course Maggie could not have given them to him even if she had been willing to do so. Doctor Blythe returned home after his professional visit, and, sleepy as he was, did not forget to put the flowers in water. Then he slept as a healthy country physician of good nerves can sleep. He lived in a boarding-house, and one of his fellow-boarders was in the habit of straying into his room at all times, the Doctor never locking his door, because on one occasion when he did so they had to nearly batter it down before he could be awakened to attend a case that demanded immediate attention. Accordingly this young person, Jim Masters, "dropped in" on this eventful morning. As the Doctor slumbered profoundly Jim had to look out for his own amusement. He meandered around the room and soon espied the bouquet. The Doctor not being given to those things, Jim's attention was aroused; he examined it, and the flowers around the moss-roses being slightly withered, he saw that it was a bouquet within a bouquet. Nobody ever stood on ceremony with the Doctor, and Jim least of all; so he had no hesitation about drawing out the little bouquet. It was still fresh, Nell having wrapped a bit of wet moss around the stems. Then Jim drew the other flowers together to conceal the gap, and after that coolly walked off with the button-hole bouquet. Just as he left the house he encountered Tom Harding. Tom looked so jaunty, and the moss-roses seemed such a fitting ornament for his button-hole, that Jim, in a sudden fit of generosity, offered them; besides that, he didn't care to keep them. Tom stuck them in his button-hole, and shortly after entered the choir, where he was engaged in conversation with Maggie when Fred saw him, the service not having yet commenced.

II.

It was the Wednesday afternoon following, and Nell, who had been whipped off on Sunday morning immediately after church by a burly

young farmer, who had come in anxious haste for her, because his delicate little wife wanted sadly to see "Cousin Nell," and be benefited by her soothing powers, had just returned, leaving the farmer and his wife much the better for her visit. And now, after brushing her curls and otherwise touching herself up, she was seated at the tea-table and opening her small budget of news for the entertainment of her father and mother, who listened with much interest. Having finished the budget Miss Nell laid in a fresh supply of bread and butter and radishes, and said:

"Well, mother, any news to tell me?"

"Only one thing," returned Aunt Peggy; "but that's enough. Fred Bailey has gone to China."

Nell was just in the act of lifting a radish to her mouth, and remained transfixed and speechless in that attitude so long that Uncle Peter laid down his knife and fork and regarded her anxiously.

"What!" cried Nell, at last, putting down the radish. "To China! Oh, mother, don't tell me that!" For visions of poor Maggie passed before her. Uncle Peter shook his head and nearly groaned aloud.

"Yes," said Aunt Peggy, "gone for good and all. He came up Sunday night and asked for you, and seemed sorry enough when I told him where you were; and he said if it wasn't so far he'd go to see you, but it would make it too late. He looked dreadful cast down, and not like himself at all. He bid me and your father good-by, and thanked us for the pleasant times he'd had here."

At this point Aunt Peggy had a little choke in her voice, while Uncle Peter availed himself of the opportunity to give a faint groan, with his eyes still fastened on Nell.

"And he left good-by for you and all the girls," continued Aunt Peggy; "he said he had no time to go round among them. The next morning I saw him go off in the stage. He was as white as the wall. He put out his head as he passed, and just gave one wave of his hand, and then sunk back as though he couldn't look a minute longer."

Nell's appetite was gone. After a moment she rose from the table, and briefly saying, "I am going to run over to Maggie's, mother," disappeared.

As soon as the door was shut Uncle Peter exclaimed, with a mournful shake of the head, "My poor Nell! my poor little Nelly!"

Aunt Peggy surveyed him with surprise. "Why, what in all this world has taken the man? Why, father, it can't be that you think Nell cares for Fred Bailey more than a friend! You can put that out of your mind, and don't go worrying yourself for nothing." Then, in a lower tone, "Nell! What bats men are, after all!"

Uncle Peter, having unbounded faith in Aunt Peggy's wisdom and truthfulness, was much consoled, and applied himself with relish to his

supper, attending to his share of it and Nell's too.

Meanwhile Nell made her way to her friend. Her heart sank as she approached the house. She expected to find Maggie pale, drooping, heart-stricken; but as she stepped on the broad piazza to her amazement she heard a burst of laughter, in which Maggie's clear notes rang out. With wonder she entered the room, and found her, with half a dozen girls around her, listening to some joke of Tom Harding's, who sat near her, she, with bright eyes and brilliant color, laughing merrily with the rest. Nell had nothing left to do but join the circle, all receiving her with a hearty welcome. The evening passed on, Nell vainly trying to exchange a word apart with Maggie. The more she watched her the more uneasy she felt. The faithful friend could look more deeply into that tender soul than the others could, and she was not satisfied.

"Maggie," she whispered at last, "will you come over and stay all night with me, or shall I stay here?"

Maggie gave one glance, saw the determination written in Nell's face, and yielded. "I will go with you," she replied, faintly.

After the others departed, and Maggie and Nell were on their way to the house of the latter, Maggie walked so fast and asked so many questions relative to Nell's visit that there was no opportunity for aught else.

When they reached the house Maggie kissed Aunt Peggy in a laughing way, telling her one of Tom's jokes, and then ran up to Nell's room; but when Nell went up, ten minutes later, she found a despairing figure kneeling by the low window, the head resting on the arms. As Nell approached Maggie raised her head. Oh, such a pale, wan face she showed—the color gone, the light quenched! Nell said not one word; she sat down on an ottoman by her, and gathered her to her warm bosom. Then the bitter grief burst forth, not in wild cries, but in heavy sobs and tears like rain, till at last she lay quiet and exhausted in Nell's loving arms. Then Nell's voice gently broke the silence:

"Maggie! I know he loves you dearly. Why did you let him go?"

Trembling, creeping closer to Nell's bosom, she replied: "Oh, Nell! I too thought he loved me! But if he did, why did he leave me so? He never said a word—no, not a word."

Nell started in surprise. "There must be a misunderstanding," said she. "Think, Maggie, and try to tell me all—what did he say on Sunday?"

"Nothing," replied Maggie. "I never saw him, though I heard some one say he went up the choir stairs just before service began; but he was not there."

"Tell me what happened in the evening," said Nell; "he took you in to tea."

"Yes, but after that we were not together at all; and before we left the tea-table he seemed different; and all he said to me about going to

China was something at the table about another deciding for him; if he got the button-hole bouquet, he said, it would mean stay; but I didn't know what he meant."

"But you gave it to him," cried Nell, pushing Maggie back to look at her eagerly.

"Gave him what?" asked Maggie, trembling and trying to draw nearer.

"Do you mean to say," exclaimed Nell, "that you never gave him the moss-rose bouquet I made, and told you how to draw out? I told him you would give it to him, and that it was made for him."

Maggie uttered a sharp cry, and both started to their feet; she looked wildly at Nell.

"Tell me," she gasped. "I knew nothing of this."

Then Nell told her, told her with a sinking heart, for she guessed that Maggie had slumbered, and that her well-meant act had caused much sorrow to two hearts. When she finished Maggie wrung her hands.

"I knew nothing of it," she moaned. "Oh, my love! You did care for me, and thought my heart was cold to you, so you have left me and gone on your weary way alone. Oh, my love! my love! And I know it all too late, too late."

She sank by the window and gazed with straining eyes toward the distant horizon, as though the soft, moon-lighted clouds she saw there were the white sails of the ship bearing away her lover.

"He is gone!" she said, in tones of utter despair, and stretched out her arms toward the clouds.

"It is not too late," cried Nell, impetuously, walking up and down the room; "it is not too late. I will write to him, and he will come back in the next ship."

"No," murmured Maggie, faintly. "No, Nell, that I will never consent to. He may have had other reasons to keep him silent. He could have spoken again on Sunday had he chosen"—for poor Maggie had never noticed the flowers in Tom's button-hole.

And to this determination did she adhere. Nell was astonished to find so much firmness in that gentle spirit; but so weak and trembling was she that Nell in alarm undressed her and laid her in the bed as one would do with a child. Still, before she laid her sorrowing head upon the pillow she made Nell promise that she would not write.

III.

The months rolled on—slowly to poor Maggie, who hid her secret so well that none guessed it; slowly to other sad hearts, but quickly to happy lovers and bright souls. Another summer bloomed, and the earth again brought forth her beauties. To Maggie every opening flower gave a fresh pang, though each pang was a hidden one. Her character developed more and more; her secret sorrow added to her pure and delicate nature the very things it needed.

It was a lovely afternoon in June. Nell was in the parlor, half dozing over some fine stitch-

ing, when a step on the piazza roused her, and the next moment plump little Doctor Blythe trotted in. He dropped into an easy-chair and said, with a sigh of satisfaction, "Pleasant room this."

Nell continued to stitch and *almost* doze; the Doctor meditated, and did it with his eyes fixed on the open window; his gaze absently fell on the corner of the piazza, but after a moment his look brightened, and showed that he noticed the spot. An amused twinkle beamed in his eye, and in an instant more he chuckled. Nell looked up inquiringly, glanced at the chuckler, and then out of the window. The Doctor explained:

"I was thinking of a little joke of mine."

"What was it?" asked Nell, in a rather drowsy tone.

The Doctor, in an animated voice, related the little story of his standing on the piazza one night the previous summer, when Ned Stone put a bouquet in his buggy, and how he (the Doctor) forthwith changed the flower bouquet for one of grasses.

Nell listened with indifference. Maggie had never mentioned what she did with the bouquet, and Nell took it for granted that she kept it.

The Doctor continued: "The whole thing was a good joke—those flowers went through so many hands; I wonder I never told you of it, but I had some busy cases about that time, and it went out of my mind. I don't know where Ned Stone got the flowers; but I stole them from him, took them home, and Jim Masters stole the middle out."

Nell pricked up her ears. "The middle!" said she.

"Yes," replied the Doctor; "he told me of it afterward; said the middle came out—was made up separate from the rest. He took off the middle and gave it to Tom Harding to stick in his coat—so you see Ned Stone had the flowers, *one*; I, *two*; Jim, *three*; and Tom, *four*—four pairs of hands they passed through," added the Doctor, triumphantly.

Nell sat breathless, but she kept her eyes down and stitched on while saying, carelessly, "What kind of flowers were they, Doctor?"

"Let me see," said the Doctor, reflectively. "Tea-roses?—no; lilies of the valley?—no. I have it! Moss-roses! I remember Jim said there was moss round the roses and moss round the stems, for it seems there was some moss wrapped around the stems. I thought it a good idea."

Nell made no reply; she understood that in some way Fred had seen Tom with the unlucky flowers in his coat, and had taken it for granted that Maggie had given them. After a moment she said, in a sprightly tone, "Doctor, do you like waffles?" You may be sure that the Doctor did. "And peach marmalade?" continued Nell. The Doctor's eyes twinkled—he had a weakness for peach marmalade, and Nell knew it; he cast a speaking glance upon her. "Don't I?" he murmured. (Aunt Peggy's marmalade

was known far and wide.) "Then stay to tea," said the beguiling Nell, "and you shall have both."

The Doctor settled himself still more comfortably in his chair, and said he would. Nell went off to give directions, and in a few minutes returned. She seated herself near the Doctor and commenced a desultory conversation, that after a time worked round to Fred Bailey—how pleasant he was, and so forth.

"Have you ever written to him, Doctor?" asked Nell.

"No," replied he; "never thought of it, and don't know his direction either. You know he wrote once to old Mrs. Johnson where he boarded—the old soul was very fond of him—to tell her that he had arrived; but he gave no direction."

"You ought to write," said Nell; "he'd be delighted to hear, I know; and you could direct the letter to the care of his uncle in New York, who would send it to him."

"Dare say he would," replied the Doctor. "I will write some day. Fred was a right good fellow."

I'll not stop to relate the whole conversation. It is enough to say that Nell, who was really not a manœvrer, did descend to that; and so blindfolded and led the worthy little Doctor that the result was he wrote a long letter to Fred, telling him the village news—Nell sitting by him while he did it. Among other items he told him Tom Harding was engaged to Sally Mason (the same little flirt who took possession of Fred that unhappy night), and finally wound up by relating the joke of his carrying off the bouquet, and how it afterward passed into Tom Harding's hands. The Doctor never for a moment suspected that he did not write that letter entirely by himself and quite of his own accord. On the contrary, he plumed himself on the whole affair, and chuckled as he thought how Fred would laugh over the joke.

The letter went; but it had a long journey before it reached its destination. Through some mistake it wandered far and wide; the months rolled on. Nell never told Maggie of the Doctor's letter; she feared to awaken false hopes. Another summer bloomed, and Nell thought that Fred had ceased to love. She and Maggie never spoke of him when together; in fact, they had rarely done so even in the first few months after his departure. Nell's only consolation was that Maggie was not in the least compromised by the letter, as her name was never mentioned in it.

Again June brought the summer beauties on the earth. Aunt Peggy's old garden flourished, and sweet were its treasures. Down one of the long walks stood the moss-rose bush, covered with its lovely flowers, and before it late one afternoon was Maggie. Why did she come? Some magnetic attraction must have drawn her, for she always avoided this part of the garden. The sight of a moss-rose sent such a keen pain to her heart, even now, that she sickened

when she beheld one; but to-day she had sought them. Slowly she approached the bush, and gazing on it, pressed her hands upon her breast, while two heavy tears fell down her cheeks. She started, and recovering herself bent over a cluster of buds and plucked them; with drooping head she looked on them. What sad, sad memories they recalled! and yet the pain was sweet, sweeter far than forgetfulness.

But while she stood thus a step on the winding gravel-walk near her made her start; she listened, breathless and deathly pale: surely she knew that step. In another instant he appeared before her. Bronzed as he was she knew him. Both stood speechless, looking in each other's faces, while the moss-roses trembled in Maggie's clasped hands.

At last Fred said, with a trembling voice, and drawing a step nearer as he spoke:

"Will you give me the moss-rose buds *now*, Maggie?"

And Maggie laid them in his outstretched hand.

SQUIRE SUFFOLK'S SUBSCRIPTION.

SQUIRE SUFFOLK was the richest man in North Grafton, and gossips said the stingiest. "As close as the bark of a tree," they described him, for in a country place like North Grafton a small fortune entitles one to rank with the Rothschilds. In the mean time let us hope that the Squire was not so narrow as they believed, since deponent saith that the father of lies is not so black as he is painted; and the Squire, having made his money as a contractor, perhaps only carried his business habits into private life, and contracted his views on charity till contraction was no longer a virtue. It was said that he kept bachelor's hall because a wife would be expensive; that he went to bed at twilight because kerosene was high; that he wore his shabby clothes of an old style—old even for North Grafton—because broadcloth had gone up, and tailors had a disagreeable custom of coming down upon one; and furthermore, that he had pawned his silver to escape the grasp of the assessor.

How true all this was let Miss Catherine Poore answer. Miss Poore, who took in sewing, and had made up more than one piece of fine linen for the Squire, and who, during her vacations and hours of relaxation, purveyed for the parish or any needy body who came in her way—one human creature being quite as worthy as another of her aid and sympathy.

One summer morning Miss Poore tied on her straw bonnet—the identical bonnet she had bought with the money Squire Suffolk had paid her five years ago, and which bonnet she had sewed over with her own blessed fingers four separate times, in order to be as near the fashion of the day as respectability required—so one morning she tied on this work of art, and taking her purse, as a necessary precaution she believed, bent her steps along the blooming

country road toward the imposing mansion of Squire Suffolk, on charitable thoughts intent.

Now Miss Poore was no blooming miss of twenty, with dimples coquetting with blushes on her cheeks, and eyes running over with lovely mirth, and the peach-bloom of youth thrown like a glamour over all. She was simply a plain woman of forty or thereabout, with a face in no way remarkable, except for its expression of kindness and good-humor; and these, be it said, are the faces that best outlive youth, and that catch at last the reflections of the spirit, and grow beautiful in the illumination of good deeds and pure thoughts. Miss Poore was just the one to beg for others and desire nothing for herself; just the woman to make a thousand plans for the welfare of others, and feel their frustration as acutely as if they had been for her own personal happiness.

She was shown into the dining-room at Squire Suffolk's, where she found him dawdling over a late breakfast, which the servant had just brought in on a silver tray.

"You make me ashamed of myself," said he, reflectively sugaring his coffee by the aid of wrought silver tongs of an ancient design.

"I'm sorry. I hope to make you pleased with yourself before my visit is over."

"Then take this seat, Miss Poore, and drink a cup of this Mocha; it's my own importation. There isn't another such beverage in North Grafton, I'll venture to say."

"Thanks. I love Mocha, but it doesn't love me."

"That's odd, very odd of the Mocha; unrequited affections, eh?"

Miss Poore laughed, but she was thinking rather of a family in North Grafton who drank cold water every morning at breakfast, only indulging themselves in the luxury of tea on Sundays, in order to keep in countenance the father, who needed it to assist him through the wear and tear of the day, and who disdained any daintiness which he must enjoy alone. This was the country pastor, the Rev. Herbert Hasent and family, who lived, or rather suffered, on a salary of five hundred dollars a year, and what extras were to be obtained by fitting stupid boys for college. She cleared her voice then, a little nervously, for action.

"Mr. Suffolk," said she, "I have come on a matter of business, and I may as well get it over at once and leave you at your breakfast in peace."

Some dim idea of sewing-work flashed through his mind, while he involuntarily ran over the items of his wardrobe.

"I don't see—" he began.

"Oh, please don't refuse till I tell you. With the aid of several charitable societies we are fitting out some young clergymen as missionaries to the Feejee—"

"Oh, the missionaries be hanged!" he interrupted, scenting danger perhaps for others besides the missionaries. "I beg pardon, Miss Poore; but—the devil—it seems to me that charity begins at home."

"I've no objections to that, only don't make her too much of a home-body; a little neighborliness is good."

"Eh? They'll be eaten alive, those young fools. It's downright unchristian to send them out merely as food for the savages. I won't lend a hand to such cruelty. I—"

"Very well," said crest-fallen Miss Poore, rising to leave.

"No, it's *not* very well—begging your pardon again. Sit down, sit down. Now it stands to reason that if the call was a worthy one—that is, if I believed in it, why—the fact is, I should be as ready as the next one. There's your minister now, the Rev. Mr. Hasent—never was a poor devil better named—he *hasn't* a cent to bless himself; his wife wears calico in December; he buys fuel by the barrowful—so my gardener tells me; he wears patches into the pulpit; they live on beans and oatmeal! Why doesn't some one raise a subscription there? I would come down with something handsome—upon my word I would!"

And here the Squire tossed off his cup of Mocha, well satisfied that he had staved her off with his specious humanity. But Miss Poore was valiant, and not to be worsted in the encounter.

"You speak feelingly," she said; "it does you credit, I am sure," taking out her tablets. "What a luxury it is to be able to give where your heart dictates and your judgment approves! Acting upon your suggestion, I will open a subscription for Mr. Hasent at once, and headed by *your* name. I am certain it will meet with great success."

This was a turn of affairs the Squire had hardly anticipated.

"You won't get a cent, mark my word."

"I shall make the effort, at least. What shall I put you down at? A great deal depends upon that, you know."

"I should think so. Why, my dear lady, you won't get a sixpence out of these clodhoppers. Come now, I won't put my name down, but I'll do this for you: I'll agree to double all you collect. Now isn't that handsome?—I guess I've heard the last of that story," thought the merry Squire.

"Thank you," said Miss Poore. "Then you'll see me again. Good-morning, Mr. Suffolk."

And she was away through the blossoming lanes again without a thought for any thing but Mr. Hasent's comfort and the Squire's offer.

"How very good it was of the Squire!" she said to herself; "he isn't so mean as people believe, after all, if you only work the right vein. Heigh-ho! what a godsend it will be to Mr. Hasent—a little ready money for the necessities of next winter; a new gown for little Belle, who hasn't been at church for weeks; a jacket for Tom, who is irremediably out at elbow."

What comfort, what heart's ease was laid up in that blank subscription list! Oh, if the days were each a year long, and all the farmers'

geese laid golden eggs! What a pity it was that so many close-handed people lived in North Grafton! There was Mrs. Adams and Captain Jackson; they were both well-to-do, but to what a wretched extreme they carried economy! Well, but now that she was passing she might as well go in.

"Good-morning, Captain Jackson. I'm raising a subscription for poor dear Mr. Hasent, and I want your name."

"You want my money, you mean?"

"Certainly; yours, and that of a good many other good people. How pleasant it is to have something to give away!"

"I should think very like; but I hain't got a cent ahead myself: never was so poorly off in my life."

"Dear me, what a pity!" sighed Miss Poore. "Now we all thought you were forehanded. How surprised the neighbors will be! Did you lose in that fire?"

"Lose! I hain't lost any thing. What put that bee in your bonnet? I hain't got a cent, though, to give to any prating parson—not I."

"Very well. Then I must go and try Mrs. Adams. The world has used her well; perhaps she is grateful enough to give her mite."

"A precious little mite you'll get there. Why, my dear woman, she's closer than a glove to the hand. She wouldn't give a cent to save her soul, provided she has one. Come, I'll venture to double what she gives; it won't stave a hole through my bulwarks, I will be bound!"

"Good-morning, then; perhaps you'll see me again."

And Miss Poore was off to Mrs. Adams's. She found that lady just turning a loaf of plum-cake out of the oven.

"Done to a charm, isn't it?" said the satisfied housekeeper. "You know I took a premium on bread last fall."

"I'm sure you ought to have one on cake, if it's as good as it looks. I wonder if Mrs. Hasent tastes such a thing once a year?"

"Not oftener, I guess," laughed Mrs. Adams. "She's too slack to beat up the eggs—catch her."

This didn't look promising, surely.

"She is not well, you know; she's an invalid. She has been denied the greatest blessing God can bestow, of which you and I seem to have store. Isn't it a pity that she should be deprived of so much besides?"

"Oh, but there must be a screw loose somewhere; either they're wasteful or something."

"Bless you, they haven't any thing to waste; they don't know the meaning of the word. Why, Mrs. Hasent has worn that chocolate calico for three years running."

"Well, you know, invalids don't wear out clothes as fast as active bodies like me and you, Miss Poore. Now it's my opinion, between us two, that Mrs. Hasent might sit up and do her house-work as well as her neighbors, if she chose. Law, think of the parson pothering about and cooking breakfast! I'd like to see the morsel of bread I would eat of his making!"

"I guess if you were starving you wouldn't ask who made it. I tell you it's a suffering household."

"I suppose all this talk means that you are out begging for them? Law sakes! it's as much as a widow can do to make both ends meet. What with ten tons of hay and a new barn swept off by fire, and a likely calf drowned in the freshet, I'm rather out, you see. Law, this is the world, and the other's the country."

"That's true; and we sha'n't any of us reach that country if we aren't open-hearted toward one another. But Captain Jackson, he warned me that I shouldn't get the *widow's mite* here. He was so morally certain that he offered to double whatever you gave, thinking, no doubt, that it wouldn't hurt him to double nothing—quite in his line, to be sure."

"Ha! ha! did he? Well now, that's a good one! I never expected the Captain would be so generous. I'd like to twist a few coppers out of the rusty old skinflint. It'll make him lose flesh. Now I think of it, I've got a ten-dollar bill that I was going to send away; but I suppose the Hasents may as well have it, and then, too, Captain Jackson'll have to fork over a twenty!"

"Thirty dollars is a very fair beginning," thought Miss Poore. It didn't seem exactly necessary for her to quarrel with the motive, when the action was so acceptable; and therefore her business carried her back to Captain Jackson's.

"Again!" cried he, looking a little blank. "Where's the *widow's mite*? *mighty* small, isn't it?" attempting the facetious.

"Well no; it's very good of her. She was just going to send it away. It's a ten-dollar bill, Captain!"

"Thunder! You don't mean it? Let's see it. It isn't counterfeit, is it? Did it give her a cramp? How did she weather it? She must be on her beam ends! Dear, dear, and I agreed to double it! Well, I've doubled the capes, and a good many other dangerous points, but bless me if this isn't double trouble. There's a *doubloon*, at all events, and gold's up, you know. I'm the last man to abandon a promise."

Very good trophies to begin with were the ten-dollar bill and the doubloon. The story of how they were obtained raised a laugh in many a farm-kitchen, and a hearty laugh opens the heart and the purse by one impulse. Miss Poore left a loophole to no one. She painted Mr. Hasent's difficulties so graphically, she related her experiences so humorously, that few could say her nay. It would have been like going to an entertainment and then refusing to pay the price of admission. Besides, none could resist Miss Poore; and who would be outdone by Mrs. Adams and Captain Jackson? No one cared to compete with those worthies; and then wasn't Squire Suffolk to double the whole amount, after all was said and done?

That was a pill which every one was anxious to administer to him, and they did their pret-

tiest in the way of compounding it. The more nauseous the better; swallow it he must, if it made him black in the face, and strangled him into the bargain.

Into every house in the place went Miss Poore and her subscription-paper. Where money was scarce she accepted produce, and borrowing a team drove into town, and drove her bargains as shrewdly as Reynard himself, only more honestly. Barn-yard fowls, and game that the neighbors' boys had brought down for the benefit of the parson and the discomfiture of the Squire; butter and eggs; lamb's-wool and sheep-skins; bags of grain, and fruit and vegetables—all was grist that came to her mill.

One morning, going into town, she met the Squire himself in his smart gig, mounted behind a tall, chestnut-colored horse, for the Squire's one extravagance was horse-flesh, said the gossips again. He reined in, however, when he recognized her, and asked if she had taken to farming, said he wanted to let his farm on the halves, would she undertake it? and threatened to waylay and rob her when she returned homeward with the funds in hand.

"You've some fine lamb's-wool there," said he, alighting to examine it. "*Card and Spinner* have engaged a hundred-weight of me at a premium. Here, I'll drop them a line, and you can take this up to them if you like, and say I sent it as an installment; they'll pay you cash down."

"But—do you know what the money's for?" hesitated Miss Poore. She couldn't make up her mind to this unfair advantage, even in the cause of the Church.

"Certainly I do. It's to ruin the Squire and enrich the parson. Shall I have to mortgage the farm, do you think? In that case I sha'n't ask you to take it at the halves."

"A persistent little brigand!" laughed the Squire, rolling along over the country road, and enjoying the breezy morning, the odor of wild blossoms, the gushes of bird-song that palpitated on the air in an ebb and flow of harmony, enjoying them as no mere miser could enjoy such unsubstantial pleasures.

"It's your money or your life with her. She wouldn't disfigure the old place either, *she* wouldn't. Blood will tell; she's got the high and mighty ways of the Jerrolds, and they bought their lands of the Indian sachems—nothing much older than that, I fancy, in this country—if they did part with them to the devil, so to speak. Heigh-ho! I thought danger was over when a fellow reached the fifties, but I *do* believe that, like the measles and whooping-cough, it goes harder with the adult."

And thus the Squire pursued his way, sometimes humming a strain of that old tune,

"'Lovely Zitana, list while I play.'—

'Brigands abroad, I may not stay.'—

'But thy bright eyes if the brigand should see,
Thou art the bandit, the captive is he!'"

All through the summer days Miss Poore

pursued her scheme, and into autumn; early in the dewy morning before her day's drudgery began, and again after it was finished. If she took a holiday to herself, it was only in order to swell the subscriptions. The neighbors caught the infection, and the children picked berries and went nutting in the season to pile Miss Poore's market wagon. Women who had nothing else to bestow took their knitting with them when they went out to tea or pleasuring, and gave the results. Ruth Brown made yards of tatting, like a trace of hoar-frost, while she gossiped about the neighbors' crops, the last singing-school, and the young man with the golden mustache who came to buy grain of Farmer Gould, and said sweet things to his daughter; while a reminiscence of this smart young man with the golden mustache, and the tender nothings he had said to Kate Gould, appeared in the disguises of graceful leaf and opening bud, in satin stitch and lace-work embroideries, undertaken in the cause; and if they did not sell the better for this it surely was no fault of Kate's; she had put her best into them. And it was Maggie Stone who surrendered the premium of a gold eagle, which she had taken at a by-gone county fair, very much as one surrenders an eye-tooth, only because one would feel infinitely worse to keep it; and Nell—not to be outdone—offered her ear-rings, and found that they were pinchbeck.

It seemed as if one and all were bent upon begging Squire Suffolk, for on the first day of November the amount had reached three hundred dollars, and the subscription-list was closed, except to the Squire.

Accordingly one afternoon Miss Poore put on her work of art, and taking her treasure with her, proceeded to the Suffolk place. It was a bleak autumn day, a forerunner of sleet and storms and pinching wintry weather, and Miss Poore, wrapping her threadbare shawl about her, was glad at last to find herself before the blazing fire in Squire Suffolk's drawing-room. It seemed to her at first as if he would never allow her to come to the point. Either he had forgotten all about the affair, or meant to wear out her patience; but *that* was simply inexhaustible. In the mean time he entertained her with a detailed account of his estate, as if he were the steward and she the master; with the increase in his crops and prices; with the story of his youth and school-days; of his first beaver and swallow-tailed coat; of his awkward first love; and when he paused it occurred to Catherine that she knew him perhaps better than he knew himself. She wondered at this strange familiarity which was growing upon her; and when at length she pulled out her subscription-list it was with a quaint reluctance of manner not at all like Miss Catherine Poore's usual promptitude. Was she afraid he would fail to fulfill his obligation, and so disappoint her hopes? Was it because, having acquired a sort of friendliness for him, she feared lest he would prove the niggard?

"Three hundred dollars," said he. "You have done finely!"

It plainly wasn't a very stunning affair to him, or he met an emergency with consummate coolness.

"Yes. I have it here in ready money. You shall count it if you will."

"Three hundred dollars! Why, child, I haven't so much on hand." She had feared it would come to that. "I never keep it about me, you know," he pursued. "I don't like to put a premium on murder, to make it worth the servants' while to put a dirk through me any time after dark."

She left her seat then and prepared to go home. She was quite miserable at that moment. To be balked thus! Six hundred dollars would have gone so far with the Hasents—they needed it so sorely! Only yesterday she had seen Tad's stockings peeping through his shoes; and then the doctor had ordered porter for the mother; but it was one thing to order and another to obtain. Here would have been porter and plenty. She did not realize that all this, bad enough truly, was yet not enough to make her so dispirited as she seemed. She felt as if some disaster had overtaken her which money in itself had no power to alleviate.

"I will send to town to-morrow," said the Squire, "and you shall have the money before night. Will that do?"

"Do!" The tears stood in her eyes, the reaction of feeling was so intense. You can not understand what it was to this woman, who loved her neighbor as herself, who made his welfare, spiritual as well as material, a personal thing, a happiness, the business of her life.

She called in at Mr. Hasent's on her way home. There was no cheerful blaze in the grate. Mrs. Hasent sat bolstered up in bed darning stockings, while her husband made the toast and tea, and lighted a solitary lamp. Miss Poore looked about her and thought of all the changes to come: of the comfortably clad children; of the warm winter fires; of the new suit that should replace the shabby black of the father's; of porter and partridges for the mother—and then she bid them good-night, and her gladness illumined the path before her so that she seemed to walk in noonday.

She went about her work as usual next day, never allowing her gaze to wander out expectantly, till a sharp ring brought her to her feet, with her nerves all quivering in the flesh, as if the points of innumerable pins were stabbing her through and through. It was the money from the Squire, in crisp bank-notes, the full three hundred dollars—but what else? What was it that made Miss Poore's hand tremble like an aspen, that sent the tears dropping slowly one by one, and made her flush and pale before this scrap of paper?

"MY DEAR MISS CATHERINE,—'The stingiest man in North Grafton' offers you his hand and heart. As it is the first time in his life that he has been guilty

of such generosity, pray encourage him, and heal him of his infirmity.

JOHN SUFFOLK."

And so Mr. Hasent's heart and home were gladdened with the six hundred dollars, and this gladness rebounded upon the Squire and Catherine Poore; and there was a great wedding, for North Grafton, in Mrs. Hasent's best parlor, and every body had a new gown for the occasion, not excepting the hostess herself, whose new gowns were like angels' visits—few and far between.

[As a veracious historian I feel bound to state, however, that in looking more closely into matters Mrs. Adams's ten-dollar bill confirmed Captain Jackson's worst suspicions, and proved to be a counterfeit. Strange to say, that gentleman was so well pleased with this result that he flatly refused to take back his doubloon, as under the conditions he would have been justified in doing. As for Mrs. Adams, we will give her the benefit of a doubt.]

MOTHER AND CHILD.

WITHIN her rustic woodland bower,
Like some warm-hearted, tender flower,
With young buds all around her,
She kept in her gracious and glad content,
And never a dream nor fancy went
From the tendriled twigs that bound her.

The house was full of the pleasant noise
Of gay glad girls and sturdy boys,
Each with a heart like a blossom;
They were seven in all—five ranged between
The head that was touching sweet sixteen
And the babe on the mother's bosom.

In hopeful toil the day went by,
And when the tired sun built in the sky
His great, red, cloudy bower,
She gathered her buds about her knee—
The sturdy three, and the gentle three—
This motherly woodland flower.

And when the glory died in the west,
And the birds were all in the sleepy nest,
She would sit in the twilight shadow,
And think how her baby should grow so fine,
And make her place in the world to shine
As the lily maketh the meadow.

Years came and went, and the pleasant noise
Was hushed in the house, and the girls and boys
Came now no more about her;
As the bird went home to the drowsy nest,
And the sun to his cloudy bower in the west,
They had learned to do without her!

The little children that used to be—
The comely three and the sturdy three—
Young men and beautiful maidens,
And each had chosen out of the heart,
And gone to be in a bower apart,
And to dress them separate Edens.

And the mother's thoughts went wearily
Across the prairie, and over the sea,
And through the wintry weather,
About the streets, o'er the desert sand,
To take them once again by the hand,
And to gather them all together.

But alway, as the sun went down,
And the gold and scarlet fell to brown,
And the brown to deeper shadow,
Her babe made all the house as bright
As the lily, with her leaves of light,
Maketh her place in the meadow.

She could not grow from the loving arms,
Nor go to meet the wide world's storms
Away from the lowly portal;
For Death, in the brodered slip and cap,
Had left her to lie in the mother's lap,
In her babyhood immortal.

Editor's Easy Chair.

THERE was recently in Boston a meeting of working-women to consult upon their condition. The persons who spoke told a very simple tale of labor and suffering from their own experience, and a very pitiful tale it was to read. It reminded you of that picture in which John Leech represents a skeleton figure of Death sewing shirts, in illustration of the slop-shops of London. How painful the stories were that were told of the sewing-women in London! How terrible the tragedy of the Isle of Dogs which we were lately describing in these very columns! And how near London is, after all—not further off, at least, than Boston; and the Isle of Dogs in how many slums not a thousand miles from this very Chair!

There was one woman at the Boston meeting whose description of the daily and nightly life of her hard-working sisters was startling because it was so calm and vivid. There are thousands of poor women in that city, she says, who subsist upon starvation wages. The consequences we know. The history of every city reveals them. But the most tragical point of her narration was that in which she said that, when complaint is made of the smallness of the wages, the employer, in a dry, business way, with no apparent intention to insult, and no leer of insinuation, often says to the girl that if she has any gentleman friend to supply clothes, the wages will probably be enough. How the truth puts our fine fictions to the blush! Here we are, all writing novels, stories of to-day, tales of American life, and other things; and there is the opera *bouffe* to show how our tastes incline, and we writers have not dared to depict the plain fact; or, rather, we have not known it.

Perhaps, however, the sequel of the revelation made at the meeting is still more painful. One of the newspapers, which was unwilling to believe the stories as they were told, added the remarkable statement that, if there were so many women so sorely pressed to live by the needle, there were plenty of places where they would be thankfully employed as domestic servants at good wages. This is probably true, and yet they will not go. The one thing which they can not bear is what is technically called service. What a change from the time when country girls came to town and, without losing self-respect, did all the household work of families!

"I hope I can do better than slave in a kitchen," is the instinctive and indignant reply to a remote suggestion of this kind. Oh ho! then we have not quite weeded out that tough old Canada thistle of caste, of aristocracy, of gentility, of whatever you please. What was that discourse upon the Dignity of Labor which so enchanted us a little time ago? And it is not labor after all that is dignified and ennobling, but only certain kinds of labor. Front de Bœuf and Brian de Bois-Guilbert despised the Jews because they made money in trade. Trade was for the scum and lees of humanity. The labor of thwacking the shining helmet and the thick cuirass and corselet of a knight at arms, to grapple with men as with wild-boars and to butcher them if you could, that, look you, was

work worthy of gentlemen and lords of high degree. But the peaceful exchange of commodities, fugh! that was work for the cursed Jews who had crucified the Saviour, and who should be forever well ground for their pains under the heel of Christendom.

Trade, you see, in those most wretched days—in King John's days, for instance—was as heartily despised by the lords and ladies as domestic service is by us who are lords and ladies. And yet what a prodigious reflection it is which, "in a season of calm weather," comes floating in upon our minds that we lords and ladies of to-day, who recoil from the thought of domestic service, are ourselves engaged in the very work which the barbarous lords and ladies a few centuries ago thought fit only to be left to the slag and refuse of mankind! By-and-by, say in the twenty-ninth century, will there be a class of workers and a kind of labor which will be considered so intolerable and degrading to the aristocracy engaged in domestic service as that employment seems to us now?

Some labor, indeed, as a very quick-witted young person, who has just come in, remarks, requires more brains than some other. To manage a huge commercial or manufacturing business, for instance, the same young person suggests, certainly demands higher qualities than to sweep out the counting-room which is the head-quarters of the business. And, therefore, continues the new-comer, with a force of logic which is full of promise, the labor that requires more brains is certainly the most respected; and that which requires none at all, for which a certain amount of brute strength and dexterity are alone necessary, is of the least account.

The new-comer is certainly correct as to the fact that more brains are essential to the one than to the other. But can a thing that ought to be done be more than well done, and if well done ought not the respect for it to be as pure in kind as for the doing of any other necessary thing, although it may be less in degree? Lois and Jerusha leave home to earn an honest living. Lois is quick, handy, full of tact and taste, and she is presently a milliner in high repute. It was her neat equipage that you passed in the Central Park yesterday afternoon. Jerusha is slow and heavy, and she is after a dozen years the same honest chamber-maid she was at first. We all acknowledge the superior gifts of Lois. But unless labor be in itself disgraceful we ought not to feel that Jerusha is stigmatized by the kind of labor to which she is devoted. The labor being necessary is honorable, is it not, O good American? Then there can be no dishonor in engaging in necessary labor, can there, O logical new-comer? What are the familiar lines of the sweet singer George Herbert?

"A servant with this clause
Makes drudgery divine,
Who sweeps a room as for thy laws
Makes that and the action fine."

And certainly who governs an empire not as for those laws can not be honored, whatever the brains.

Look at the case of the Boston work-women. An employer says to them, let us suppose, "Here are a dollar a week, a garret, cold, and starvation for sewing shirts." Another employer says, "Here are a home, plenty of food and fire, and eight dollars a month for chamber-work." Brains, if you please, do not much enter into the calculation. Yet there is a recoil as of insult and injury from the last, and a bitter acceptance of the first. If the reason of this recoil be what is called pride, is it an honorable pride? Jane goes into a cotton-mill, Jemima into a kitchen. May Jane, for that reason, take airs and feel that she is the lady, while poor Jemima is a menial? And menial is not originally a word of discredit or humiliation. It means merely family or household; and servile is only the quality of serving; and we Christians, you remember, do not speak ill or think ill of serving others.

"Ah, indeed, Mr. Easy Chair!" exclaims that very lively young person who has just dropped in. "And how would you like to be a waiter at Delmonico's?"

Well, my young friend, the Easy Chair would not prefer that profession, because there are natural tastes and choice. One man would be a musician, another a carpenter, another a printer, another an author, another a barber, and another a waiter. Then there are necessities. A man can not always choose what he will do—

"Yes, yes; but," interrupts that new-comer, "you are drifting away from—"

Calmly, my young friend; the Easy Chair is drifting straight to its answer. Obligated to make an honest living, if the methods which it preferred were impracticable for it, it would lay a cover and flit a napkin without the least sense of disgrace. And if the alternative were to run abominable errands at starving rates, or to wait at fair wages, which would my young friend prefer for himself? This last is the Boston alternative, as I understand it. The "pride" of the poor women, it appears, or it is assumed, prefers the starving wages for shirt-making with a "gentleman friend" to the household service.

Now it is clearly not the labor which decides, but it is another kind of consideration. It is the feeling that to do the one is to be more of a lady than to do the other. More of a lady? Why, good woman, what is a lady? If she could answer she would say, to dress finely and do nothing. Yes, and for that theory which poisons and ruins this poor life of hers—how many of these poor lives, indeed!—we, that is, society, must bear the responsibility. It is not the poor women and their pride that are to be blamed; it is we and our folly, that make the public opinion to which they sacrifice every thing that is most precious and sacred, who are the real sinners.

Now when the Biddy question has become so important, it is perhaps worth while to think of this a little. Suppose, dear Madame, that we should begin a reformation in the parlor, and free our minds of the feeling with which domestic service is usually regarded, by being humane and courteous masters and mistresses. There was no more refreshing little spectacle a few years ago in London than that of the excellent Monsieur Soyer, a cook, "a mere cook," who might any day for many years have been seen with his white cap and apron presiding over

sauce-pans—no more refreshing spectacle than that of this worthy and useful member of society driving up in his coupé to the great clubs, stepping out and paying his visit to the kitchen, like a Don of medicine to the drawing-room of a palace, then stepping into his carriage again and rattling briskly off to his next post of duty. F. M. the Duke of Wellington did his duty no better, and was no more to be honored for it, however much more we may have admired his superior qualities. His work was no more essential than good cooking, and he did it no better than Soyer did his.

The late Prime Minister Disraeli has a pleasant satire upon this fine art of cookery, and upon its eminent professors, in the opening of his capital novel of "Tancred." But read "Vivian Grey," and see if his description of his own craft of statesmanship there does not seem equally satirical. Good statesmanship is very important to a great nation, but good cooking is indispensable. Think of the kind of cooking to which this hapless country is now subject! If some good angel should smile some morning from the roof of the magnificent Park Bank—and the Easy Chair beseeches the reader not to expect it of the worthy stone angels who permanently reside upon the façade—and announce that he would straightway introduce a race of neat-handed Phillises, and artists not less skilled than Monsieur Blot, would we not gratefully build him a statue in the Central Park?

But if we doubt and despair of angels, why not cultivate an opinion that domestic service is not to be contemned by women, and by removing such stigma as may now rest upon it, persuade these hapless women of whom we were speaking that it is quite as honorable and lady-like, quite as harmonious with the truest "pride," to serve in a household as to sew in a shop, or starve in a garret, or flaunt in a gay dress at the theatre with a "gentleman friend?" It is among us who sit in the parlor that the real feeling in regard to the kitchen takes its rise, and that dirty fountain must be purified at its source, or not at all.

It is a question for "gentlemen of the Press" practically to determine whether the freedom of the Press is to cover the publication of every kind of private conversation. But in the courts of honor and good taste the question is, however, already determined. If a reporter waits upon a Senator, or any other person of high official position, and says, "Sir, I am the correspondent of a daily newspaper in every large city in this country, and I should be glad to know your views upon the *Alabama* question, and upon the Cuban question, that I may write them out and submit them to you for publication in my various journals," the Senator or other distinguished personage would govern himself accordingly, and talk with his interlocutor as if he were addressing Congress, with a regiment of reporters lying in wait for every word he uttered.

Or if one of the same gentlemen, who, with his methods of communicating with the public, and his opportunities of giving all that he relates that indefinable air of weight, justice, absurdity, or sophistry which a skillful writer can employ, is really one of the most powerful persons among us, should go to Mr. Bryant and

say, "Mr. Bryant, sharing the universal respect which is felt for you by your countrymen, and proud of your fame and of your life and character, I should be very much gratified if you would favor me with your private opinion of the poetical performances of Mr. Longfellow, and your views of the comparative poetic merits of Mr. Whittier and Mr. Emerson, and your individual preference between Mr. Stedman and Mr. Stoddard, that I may impart a freshness of interest to the letter which I am about writing to the *Echo of the Rocky Mountains*"—and if Mr. Bryant should reply, "My dear Sir, I am happy to say that I think very small beer of Mr. Longfellow and of all the other gentlemen whom you have been pleased to mention," he would have no right to be surprised at the appearance of his opinion in print; and if the correspondent stated all the facts of the interview the public could not accuse him of any impropriety, whatever judgment it might form of the discretion of Mr. Bryant.

But now, when we read in the newspapers a letter from a correspondent describing his interview with any noted person, there is a feeling of shame, as if we were overhearing a private conversation. It is a very small soul that peeps through a keyhole, and we can not escape an unpleasant conviction upon reading such letters that we have been involuntarily thrust into that position. The Easy Chair has heard, upon excellent authority, that during the happy administration of the late enlightened and docile Chief-Magistrate conversations occurred in that abode of peace called "the Executive Mansion" which were reproduced with astounding accuracy of detail in a Baltimore newspaper. This fact was especially observed by a distinguished guest who was often engaged in conversation upon public affairs by his docile Excellency—and one day, observing a door partially open in the room in which he was talking, the guest rose quietly while the President of the United States was making some interesting remark, and suddenly throwing the door wide open, discovered a short-handed reporter industriously at work. Whether the President of the United States knew of his presence was a question which the distinguished guest did not ask, but one which he undoubtedly satisfactorily answered to himself.

And even if the excellent correspondent whose business it is to collect news, and whose pride and often profit it is to serve it up with a certain spirit and flavor for the reader, tells us that he introduced himself to the noted person as a reporter, how do we know—not that fact, for is not that fact, at least, printed in the most legible type?—but how do we know that he has reproduced the exact significance, or the significance at all, of the words of the conversation? Certainly there is room for the question, for words publicly spoken are often very curiously and ludicrously misrepresented, so as to produce an effect wholly different from the fact. Many of the newspapers color very much of the news they sell to their readers. They color it favorably or unfavorably according to the tenets of the newspaper, or to its theory of the expectations of the public.

Thus the *Herald*, in "the palmy days of the Republic," when the energies of a free government were devoted to the extension and perpetuity of slavery, used to burlesque the meetings

of the Anti-Slavery Society. So the *World* now burlesques the meetings of the Equal Rights Association. The burlesque is not the sign of hostility, for these papers merely wish to raise a laugh at what they suppose the public generally to despise. But the total misrepresentation is the same. A movement that was an utter absurdity, and which was merely a convenient text for the babble of a crowd of grotesque people—which was the *Herald's* representation—would hardly in twenty years have abolished slavery and reconstructed the Union upon its present principles. The news was colored according to the prejudices and whims of the newspaper.

The *Tribune* likewise—in this very copy now lying upon the table—burlesques a Free Trade meeting at the Cooper Institute. If it had been a meeting to advocate Protection, would it have reported a speech of Mr. Greeley's, for instance, in this manner, and the Easy Chair merely changes names: "Mr. Greeley, of New York, who was next introduced, read a paper on the blessings of Protection as seen from his standpoint. Mr. Greeley is in some way interested in foreign importations, and therefore is regarded as a singularly unselfish champion of the doctrine he preaches.....After disposing of the rhetoric pertaining to his subject, the speaker unfortunately announced that he was about going into some facts and figures which were necessary to the completeness of his speech. The unmathematical and unstatistical portion of the audience, which constituted a very considerable proportion, determined to escape the infliction, and unceremoniously retreated. This movement disconcerted the speaker, etc." This, of course, is merely turning what professes to be a report of a Free Trade meeting into a fling at it. It is Dr. Johnson assuming to define words, and saying, "Patriotism: the last refuge of a scoundrel."

Now how can we be sure when we read of an interview which was announced to the object of it as preparatory to a publication of his words, that those words have been fairly reported; that the real meaning of the Senator, for instance, has been understood; or that it has not been ingeniously perverted by a sly touch of the artist who describes it? One of the most delightfully comic of the *Punch* sketches of Leech was that of a family group at the daguerreotypers'. The artist poses them all—father, mother, daughters, sons—in the most striking and picturesque attitude. Nothing can be better than the gracious smirk of the paterfamilias, except the complacent sniff of the mater. The arms of the daughters are lovingly entwined; the toes of the sons are politely turned out. The group is a model of family happiness and the domestic virtues. "Now, steady, if you please; the operation begins; look at my nose, please, while I count ten—steady—s-t-e-a-d-y." And out it comes, the most abominable and delicious caricature. "Dear, dear," the artist may be heard saying, "a most unfortunate little jog has ruined us." It is so with the reports of the conversations. There is a sense of the little jog in them. Thus they sat—and it comes out *so*! So he spoke—and it is reported *thus*!

But there are many conversations repeated in print which evidently were not meant for the public ear, which in their nature were plainly pri-

vate, and yet which reputable newspapers print. Is it not incumbent upon the editorial responsibility to prevent such publications? Some time ago a newspaper published a long string of remarks which General Grant was said to have made upon certain conspicuous citizens. It was impossible not to see at once either that General Grant had never said what was attributed to him, or that he did not mean it should be made public. The publication could have no result except to pain certain persons, gratify a taste for "personalities," and stigmatize the General as a foolishly loquacious man. The article was undoubtedly made up of inferences as to opinions derived from an estimate of the General's character and known views, and of some rumors in the air in Washington. No sensible man believed it; but there are some people in the world who are not sensible, and the story undoubtedly did mischief. Now every such performance greatly injures the character of the press, and consequently injures the people. If it is the duty of an editor to sell his paper at all hazards, it is proper that he should permit such things to be printed. If his duty is to see that the immense power of the press is not abused to the public injury, it is proper that he should carefully exclude from his paper every thing of the kind.

The public, at least, should discriminate. Every morning there is a series of reports of facts which are in their nature purely personal. So keen is supposed to be the appetite for this kind of gossip that some newspapers almost daily publish a list of what they call personals; and long ago the late Mr. N. P. Willis remarked that what the public most desire to find in a newspaper is personalities. Now personalities may be very innocent and very interesting; but obviously the lawful line of such remarks is very easily passed. A man of note is considered to be fair prey. Whatever can be ascertained about his most private habits is ruthlessly revealed. The poet Tennyson is said to have contemplated fleeing his home at Farringdon because of the importunity of those who came to gratify, by idle staring, the same prurient curiosity which is solaced by the kind of reports of which the Easy Chair has been talking. A gentleman, bent upon ministering to this idle taste, is authentically reported to have penetrated to the parlor of another poet, and to have turned over and observed the cards upon the table, that he might impart to an eager world the names of the poet's visiting acquaintances. The inevitable result is to cover with suspicion every person who is known to "write in the papers." A friend tells you an excellent and harmless joke upon the most venerable dignitary, even upon the mayor of the city or the bishop of the diocese, and, suddenly remembering, a horrible apprehension overwhelms him, and he gasps, "For Heaven's sake, don't print it!"

Thus the recklessness of some, as Dr. Johnson would say, becomes the condemnation of all. And the remedy lies with the gentlemen of the profession. There is nothing so scandalous that if printed will not find readers. It is therefore for editors and publishers to decide whether they will procure readers by such means. And as the virtuous public will shrewdly observe that the names of the reporters of pri-

vate conversations with public men are not generally printed, and as the worthy reporters wish to make their stories "tell," the public must decide whether it is probably an authentic record which it peruses.

As when from under the shade of leafy boughs what time the dog-wood blossomed and all nature smiled serene, the savage Indian, with dreadful cry, rushed with knife uplifted upon the hapless husbandmen of the New England frontier, toiling in the field or loitering by the wain, even so from out the bright May sunshine bursts Thomas Tomahawk with exulting whoop, and brandishing his glittering steel, descends upon the mild Academicians, National Academicians, Associates, Fellows, and the Lord knows what not, and sanguinary is the slaughter that ensues. It is an old story; undoubtedly an old story. Old, but how direful! The savage Indians came every spring, now in the tranquil Deerfield meadows, now at Hadley, now somewhere else. Likewise Thomas Tomahawk comes every spring, and leaves his tracks in gore, while writhing A.'s and N.A.'s lie around his path, and the thick air resounds with moans and groans and many-voiced wrath.

Who did not expect just the ha-ha that we heard this year? The Easy Chair ascended those glittering steps in Twenty-third Street on one of the mornings which fill the mind with pleasant thoughts. How like a benediction fell the sun upon that pretty doorway, so that every eye must have been conscious of a gracious anointing! What good fairy, propitious to American art, distilled forbearance and charity in the warm air, that nothing should be harshly judged, but every thing tenderly entreated! "Speak them fair!" the soft May morning whispered to this Easy Chair, which, however, even in its sternest temper, T. T. regards as a mere melancholy mush. "Don't demand the Vaticano, the *Stanze*, the frescoed corridors! Don't insist that every tyro shall be Angelo, and every youth Raffaello, and every senior Titian! Be gentle and generous and humane! It is a cradle into which you are about to gaze; don't expect a crowned king upon his throne!"

These were the voices i' the air that murmured at the doors, and in the hall, and up the stairs. And then came the trial. Good Sir, or Madame, have you been there, and how did you like it? The wretched Easy Chair stole as silently as possible through these spacious rooms, and conned the catalogue, and gazed at the walls. "Remember," it stoutly repeated to itself, recalling the pleading voices—"remember, no foolish expectations of San Sisto and of Parma. Must every portrait suggest the Julius or the Leo, the Charles First, the Doges, the Burgomeisters? Because of Claude and Salvator and Turner, shall there be no —?—that is to say, because of that foreign virtue shall there be no domestic cakes and ale? And this ginger—the indigenous—can any thing be hotter i' the mouth? Come, come! Number nine hundred and ninety-nine. 'The Peak of Teneriffe at sunrise; a villegiatura in the back-ground'—what! a villeg—well, no matter! Why so censorious? Speak them fair, quoth the angels of mercy; don't demand the Vaticano."

So the Easy Chair struggled and wrangled

with itself, and slid along noiselessly and hid behind its catalogue, lest some cold voice should suddenly creak: "Ah, well! and how do you like the pictures? What do you think of the prospects of American art? This is a magnificent hot-house, how about the fruit, and the plants, and the rest of it?" How very loud and strident such voices always are! Why not whisper these appropriate questions gently and pleasantly, and not roar them out in a bluff, defiant tone? It was pure terror of encountering such a voice that kept the Easy Chair flying along and wrapping itself up, as it were, in its catalogue; and stealing furtive glances forth from time to time to see if there were any signs of T. T. What would have happened had he appeared, the Easy Chair confesses its inability to imagine. It is easy enough, however, to fancy his greeting, "Well, old mush, what conceivable slop of praise can even you contrive to spatter upon these performances?" And as he spoke his thumb would have skimmed along the edge of that remorseless weapon, that renowned, two-handed, skull-cleaving tomahawk. Fortunately he did not encounter the uncomfortable Easy Chair, which came confounded down the stairs, and emerging once more into the warm May day that seemed tenderly full of pity and vague regret, fled swiftly along, and has not since returned to insist that it would not require a Titian of every senior nor a Raffaello of every boy.

The Easy Chair asked who did not expect that wild ha-ha which rang through the familiar columns? And how awfully it seemed to echo through the rooms! And how the poor pictures seemed to shiver and fall, like the statues of the heathen gods of old when the cry that Pan was dead rang through the Eastern sea! "Dead!" quoth Thomas Tomahawk, "why, it was never alive! Have I not for six, seven, how many mortal years, declared that American art was a ridiculous name merely? Have I not exposed, every weary year, the atrocious blotches and blurs with which the public is insulted under the name of pictures? Does any body suppose that a criminal who could be unblushingly guilty of Number blank is a person to be tolerated? Is it not evident to the veriest Comanche of intellects that a being who could deliberately perform such a villainy as Number blank must be an unfortunate Aztec? Do the American people propose to submit to this profanation of a noble art, to this desecration of a really handsome temple? Is such a preposterous popinjay as the author of yonder wart and pimple to be called an artist? I defy any spectator to tell whether this creature, for instance, is human, and whether he stands upon his head or his feet. And the author of *this*, ladies and gentlemen, is the Academy's Professor of Drawing!"

And the ha-ha rattled and roared and resounded far away; and like the vagrant musician of the streets who has played a tremendous tune, then lifts the strap for a moment around his neck, and with the same energy plays it again, so T. T. performed his task *da capo*. Hilariously skipping through the rooms, he stopped before every picture and did what the brilliant article upon Leo and Luther in our June Number says the Cardinal Camerlengo did when the Pope died: "He entered the room, tapped the corpse on the head with a mallet of silver, and then

falling upon his knees before the lifeless body, proclaimed the death of the Pope." But T. T. did not fall upon his knees; he danced jigs upon the lifeless body, and proclaimed that it was a rickety old moribund from the beginning.

And oh! if the visitor to the Exhibition could only honestly have shouted, "You lie in your throat, miscreant! Die!" and have fallen upon him in turn and scalped him with his own tomahawk! But who could honestly do this? Who could truly say that this was a collection of pictures flattering to the national pride, and full of hope and promise for the American school? Could the painters themselves say it? Did they say it? Did not some of them protest, as Savonarola protested, as Luther protested? The Easy Chair has heard such rumors. It has heard what must seem to many as incredible as the French Revolution seemed to Burke, that there is a high and resolute rebellion within the very Academy! It has heard that there are those within the very adytum who declare that there must be a change; that Leo has so gone off with his ortolans, and Greek verses, and soft pictures, and the playing of lutes, into fat and heaviness and sloth, that nothing but a reformation shaking every thing to the very foundation can possibly restore the Church—in one word, that the Academy must be reorganized, or American art will become extinct.

Already it is said that the best men do not exhibit; that the classes and the library and the academic functions generally are susceptible of improvement (that phrase is respectfully dedicated to T. T.); that the funds are expended in some indescribable way producing no visible effect; that the building is a beautiful incubus; that the young men ask for bread and are offered a highly polished stone; that all the weakness and folly and inefficiency of the European academies are at last fully developed and illustrated in this Academy of ours; and, in fine, again, that it must be rescued from the spirit which has controlled it, or all is lost.

This is not what the Easy Chair says ("Of course not—it is too mushy," interpolates a familiar voice); it is what the painters themselves say. The hour, they insist, has sounded. Who tolled the bell? I, said T. T., with my sting like a bee, and I tolled the bell. No matter who began it. Who began our great Revolution? The colonists. Who begin this? The artists. We conquered, and they will conquer. And then—then—let us imagine the halcyon, incredible days, when we shall all loiter through the galleries arm in arm with T. T., who will have turned his tomahawk into a laureate's pen, which, with cheerful grace, will inform us that "the Exhibition opened last evening, and a more beautiful and promising collection of works of art was never offered to the just admiration of a discriminating public. We especially commend to the attention of all friends of the higher art the *Interior of a Wild-Boar*, by Titian Jones; the *Rasher of Bacon—a Home Idyl*, by Raffaello Jenkins; and an exquisite *Bit of Pork-Rind*—a perfect gem—by Michael Angelo Buffer. No one can gaze upon these lovely works, or sit entranced in any part of the rooms, without owning that at last American art shows signs of a not distant dawn. Non nobis! non nobis! good fellow-citizens!"

Editor's Book Table.

NOVELS.

OF the novels which lie on our table we unhesitatingly award the palm to *Breaking a Butterfly*; or, *Blanche Ellerslie's Ending*. The plot is peculiar; the situations are striking and well described; the dramatic power of the author is not inconsiderable; several of the characters are remarkably well drawn; the gradual changes which life and experience produce in character are appreciated and portrayed; and, above all, the moral is one of significance and value for Mrs. Grundy and all her *protégés*. Alas! only by bitter experience will they learn that rouge is not bloom, and that "as the crackling of thorns under a pot, so is the laughter of a fool." The title of the book is its text. The romance of real life which is founded upon it is the sad story of a woman who trod the thorny path of gay society, hid a beating heart beneath silks and satins, and eyes swollen with weeping behind a veil of costliest lace, finally to die a lingering death at the hands of the husband who had sworn to protect her, and whose kindest act was the sharp and cruel utterance with which he slew her at the last. We know not how one can read this story without rising from its perusal with an increased respect for those homely virtues which often walk the world in homespun, and with an increased suspicion of those showy qualities which give entrance to our "best society," but which often only hide feebleness and folly. The crime which gives to "Breaking a Butterfly" its somewhat melodramatic ending is not very apt to occur in respectable circles, but the scarcely less heinous crime of an aimless life and a false heart is the common vice of good society, though it rarely reaps the bitter fruit in a *dénouement* so terrible. The curtain rises on Blanche Ellerslie, a gay young widow, with half a dozen lovers; a coquette, who plucks hearts for her trophies with as little scruple as she might pluck flowers from the garden, unconscious that they bleed and break. Among them all she chooses the one least worthy of her affections, and therefore, we may add, most likely to secure the affections of such a one as she—Mark Ramsay, a cold, selfish, unloving man, who, in return for all the wealth of her nature, has but a poor heart to give to her at best, and gives not even that. Such measure of affection as he once bestowed upon her he gradually transfers to another. She perceives that she is losing the allegiance of her husband, but is powerless to retain it, and suffers, as many a woman does, the protracted tortures of a crucifixion which death, as cruel in its delays as in its surprises, comes not to relieve. At length an old friend—a real though unrecognized lover—appears upon the scene. On the very eve of her marriage he had promised her his aid when she might need it. He detects intuitively the situation. He mixes a poison in the cosmetic of the wife's rival, that he may destroy her beauty and so break her charm. The plot succeeds. The fierce wrath of the husband, who in his fury charges complicity with the crime upon his pure and patient wife, gives her release in death. Her lover escapes the husband's vengeance only by taking his own life. While Mark Ramsay himself wan-

ders in foreign lands, self-exiled and suffering the punishment of Cain. Such is the thread of the story of Blanche Ellerslie's life; its darkness enlivened by much by-play, and its pages brilliant with many paragraphs often fine, and sometimes exquisitely so. (Harper and Brothers.)

Warwick; or, *The Lost Nationalities of America*, by M. T. WALWORTH, has the merit of being a sensational novel without being open to the charge of objectionable sensationalism. The first chapter introduces the story with a mysterious murder, which is not explained until the last. It is not easy, having commenced to read the book, to lay it down unfinished. The mysterious victim, whose remains are not even found until the close of the story, reappears in autographs and letters whenever our interest begins to wane. The heroine is a curious admixture who dances, discusses theology, rides an untamable steed in perilous places, and teaches in a mission school with equal zest and equal success. The author's imagination is of an original though somewhat luxuriant cast; and when, toward the close of the book, we follow the hero into the great Mammoth Cave of Kentucky, and descending into the "bottomless pit," find there in the bowels of the earth a cave of "surpassing brilliancy formed of quartz rock incrustated with fantastic ornaments and stalactites of pure gold," we are forcibly reminded of the Arabian Nights. In short, "Warwick" is wholly unreal, but none the less interesting for all that. A pleasant dedication to the author's personal friend, Morris Phillips, Esq., the genial editor of the *Home Journal*, serves the purpose of a preface. (G. W. Carleton.)

Juliette; or, *Now and Forever*, by Mrs. MADELINE LESLIE, is a very religious novel. The heroine leaves a luxurious home because her otherwise indulgent father forbids her from professing to be a Christian, undergoes a great variety of martyr-like experiences in attestation of her faith, and is finally found by her lover and restored to her penitent and distracted father just in time to nurse him in his last illness. She inherits his property, marries the man of her choice, and it is to be presumed lives happily ever after. We have no very great faith in that philosophy which represents the rewards of self-sacrifice as paid in this way, nor in that kind of heroism which such a philosophy cultivates. Doubtless virtue has its reward, but this life is not always God's pay-day. (Lee and Shepard.)

That Boy of Norcott's, by CHARLES LEVER, has the advantage of being a short story, comprised within 73 pages, a cheap story, being sold for 25 cents, and a simple story, which requires no study for its appreciation. There is no complex plot; there are no incredible incidents; there are no characters which the reader needs to study; there is no occult moral; there are no passages of studied writing. There is a simple story of a life rather full of adventure, and with incident enough to make it thoroughly readable; just the thing for a lazy hour on a summer afternoon, when the mind wants rest, not a new employment, and one reads without reflection. (Harper and Brothers.)

Typhaine's Abbey, by Count A. DE GOBINEAU (Claxton, Remsen, and Haffelfinger), and *Anne Severin*, by Madame AUGUSTUS CRAVEN (G. P. Putnam and Son), are both translations from the French, and both of them historical novels. The former presents a picture of the customs and the social life of France in the 12th century. Its author is not a mere romancer. Among his previous works are included an "Essay on the Inequality of the Human Race," "Three Years in Asia," and "Philosophies and Religions in Central Asia." The value of his romance is not in its entertaining plot, nor in its strongly marked characters, but in that it affords an apparently faithful portraiture of one phase of that great conflict between feudalism and popular rights which characterized the 12th century; in other words, that it does for the chivalric days of France, though in less measure, what Walter Scott has done for the chivalric days of Scotland. —The scene of "Anne Severin" is laid chiefly in the same country, in the days of the First Consul. It is a religious novel, transfused with the Roman Catholic faith of its author, yet can hardly be called a Roman Catholic novel. It was originally published in a Romish Magazine. Its denominationalism is not, however, offensive, nor is its fascination such as to render it powerful as an argument for the faith which it indirectly inculcates.

Kathleen will need to most readers no other recommendation than the fact that it is by the author of "Raymond's Heroine," and the assurance that it is regarded by some very good critics as superior to its predecessor. It is purely a love story; a story of two mistaken hearts, one of whom is dazzled by a hope of marrying above his station, the other of whom mistakes gratitude on account of a signal deliverance for that love which alone constitutes a true wifely affection. Though we do not agree with the *Athenæum* in regarding the plot as unusual, it is certainly ingeniously turned; and though the characters are not themselves remarkable, they are remarkably well drawn. (Harper and Brothers.)

Men, Women, and Ghosts, by E. S. PHELPS, consists of ten short stories, several of the best of which have already appeared in this Magazine. They are better adapted for that purpose than for republication in their present form. In fact, the ghosts form a little too large a proportion of the book to make it altogether cheerful company. (Fields, Osgood, and Co.)

Springdale Abbey purports to consist of extracts from the diaries and letters of an English Preacher, edited by JOSEPH PARKER, D.D. It is a republication of an English book, and can hardly be ranked as a novel, though we do not suppose that it is genuine biography. It is, however, autobiographical in form, and depends for its interest, not on startling adventure or striking incidents, but on a certain quiet humor that invests the occurrences of everyday life with a peculiar attractiveness. Many a pastor has a Squire Fogden in his parish. Few know how to enjoy a merry laugh under a sober face at his side-board. Many a man has sighed in his heart when every day a new society has presented its claims upon his benevolence, equally unable to deny that the cause it represents is deserving of support, or to see any occasion for a different society for every good work which Chris-

tian charity desires to undertake. But few ministers have the courage to speak out openly their sentiments on the subject; and still fewer are able to do so in a manner at once so effective and so inoffensive as the English Preacher in his letter on the evils of "Societyism." The author, whoever he may be, has a warm heart, untrammelled by conventionalism, and no less truly devout because brimful of a genial, good-natured humor. If we believed in Spiritualism we should hazard the opinion that the book was written by a medium, and that the spirit who employed him was Sydney Smith. We have not read a more enjoyable book of its kind for many a day. We have been tempted, breaking over our rules, to transfer some paragraphs to our pages, but on looking them over for that purpose we are satisfied that so doing would no more introduce the English Preacher to the fireside of our readers than quoting a jest from a genial conversationalist would serve the purpose of making him a guest. We can, therefore, only give him a cordial letter of recommendation to all our readers as a perfect gentleman and a remarkably pleasant and genial companion. (Claxton, Remsen, and Haffelfinger.)

SCIENCE.

It was our pleasure some fifteen years ago to receive instruction as a college student in the higher mathematics from Professor ELIAS LOOMIS. With perhaps one exception he was the most popular man in the faculty. We doubt whether there was a graduate who ever passed through his course without being, at least once, unmercifully "quizzed" by him. In other rooms the usual college helps were employed. But no man ever rode a "pony" successfully under Professor Loomis. His keen eyes—and they looked no older when we last saw him than they did fifteen years before—read the student through. By intuition he knew who had studied and who had only "crammed." But we have never known one who possessed in a more eminent degree the rare faculty of communicating to common minds abstruse and difficult truths. This is the condition of successful instruction. Knowledge is not enough. Every teacher must be "apt to teach." Under Professor Loomis geometry became a positive delight, and even Logarithms and the Calculus became comprehensible. We took up, therefore, Professor Loomis's new treatise on the *Elements of Astronomy* not with an unprejudiced mind. We felt confident that we should here find, brought within the comprehension of unscientific minds, the higher truths of a science whose grandeur is lost to the common people by the technicalities in which it is enshrined. We have not been disappointed. In the rare ability of popularizing science by clear and comprehensible statements of her highest verities Mr. Jacob Abbott is the only American author who compares with Professor Elias Loomis, though other writers have surpassed them both in the number and importance of their original contributions. We know of no treatise on astronomy to which we should turn ourselves for an explanation of any of its elementary principles with such confident assurance of receiving real satisfaction; none which we should so soon place in the hands of any young person who desired an introduction to the study. We hope to see it

widely adopted as a text-book in our schools and colleges. (Harper and Brothers.)

The Wonders of Heat, by ACHILLE CAZIN, translated and edited by ELIHU RICH, constitutes the third volume of the Illustrated Library of Wonders, to which we referred in our May Number. It is less sensational than that on *Thunder and Lightning*, and less fascinating than that on *Optics*, but rather more valuable, as a book of science, than either. This is partly due to the nature of the subject, which is certainly less *striking* than electricity and less *brilliant* than light. But it is also due in part to the fact that its author has been less anxious than his companions to make an interesting book, and more anxious to make one that is instructive. It is even more elaborately illustrated than its predecessors. (Charles Scribner and Co.)

Mrs. ANTOINETTE BROWN BLACKWELL's *Studies in General Science* is the work of a thoroughly earnest, honest, and studious woman, whose writing is the fruit of deep personal conviction. It is throughout characterized by thorough investigation; is evidently the result of much hard study and more hard thinking; and is a work less of extensive erudition than of independent cogitation. Its greatest defect is a certain obscurity of style, occasioned by an unnecessary introduction and repetition of technical terms, which render its pages not only unattractive to the common reader, but even rather hard reading for the thoughtful student. It is not, and does not aim to be, a popular book. It is a book of "studies." Its value will be appreciated only by those who think. It contains many seed thoughts; more, perhaps, that will incite to thought by provoking doubt and discussion. It is a pity that meat so good is inclosed in a shell so prickly. What, for example, is the scientific value of the following statement of the effect produced upon a young lady by the sudden intelligence of the death of her brother? "What quantitative force here was suddenly transformed into the dull, terrible chill of that first mental shock! The effect was mental, and the producing cause qualitative. The related material elements were insignificant, though the shock, once received, reacted upon the whole organism." The first four or five chapters are the least interesting. The book improves as we proceed. The chapter on Mind and several immediately following are perhaps the freshest and most valuable. In fact, the work is throughout more metaphysical than physical. The authoress very distinctly repudiates the materialistic ideas which underlie the extreme positivism of such tracts as Huxley's "Physical Basis of Life," and such works as Sir Henry Maudsley's "Physiology and Pathology of the Mind." Mrs. Blackwell's peculiar theology—for though she was educated in Oberlin she represents the opposite tendency of theological thought—appears only incidentally and inferentially. The book makes almost no reference to the Bible. It conducts us only to nature as a revealer of God. Indeed, it distinctly asserts that "we know him only as he is revealed in his works." The most notably theological chapter is that on "Law and its Sanctions." In this the authoress denies the fact, if not the possibility, of divine forgiveness, and inculcates a doctrine of an unforgiving and relentless God, harder and more repellent than any which were born of the

tempestuous experiences of the Reformation. We can not think she is ignorant of such replies to her position concerning the inviolability of law as are afforded by Bushnell in his "Nature and the Supernatural," and by the Duke of Argyle in his "Reign of Law." But she makes no reference to them nor to their arguments. She writes as though she knew nothing of them. In spite of these defects, however, we value the book. We want no better reply to the common declaration that a woman's logical powers are never highly developed; no better demonstration that the duties of wife and mother are not inconsistent with a high state of intellectual development. In truth, she exemplifies her own statement that those duties may perhaps have helped rather than hindered her. A father might have employed this illustration; only a mother would have penned it in these touching words: "When the little child tosses painfully on its bed of fever, it seems difficult for finite tenderness to look up trustingly to the All-Father, believing that he watches the little sufferer with boundless compassion. The piteous baby-moan smites us to the heart. We would so gladly give a portion of our own cool life-blood to soothe its hot little veins; would so gladly suffer in its stead; and God, who is so powerful, seems pitiless. The heart is tempted to cry out: 'He could spare it, but he will not.' No! he will not. His wisdom is too wise and his compassion too all-embracing to set aside the very being and constitution of all things to spare this one little sufferer; and to its own hurt." (G. P. Putnam and Son.)

THE FARM.

FARMING is a profession, not to say a science. If any one doubts this statement let him leave his city home—for no one bred in the country will doubt it—and undertake to cultivate even a garden of half an acre for the summer. He will then find that knowledge is as essential to the right use of the spade as of the pen, and that there is as great a difference between the scientific farming of Flanders, where literally not a weed is to be seen, and that of many of our farmers, the wealth of whose soil is about equally divided between fruits and weeds, as between the trade of a modern commercial city and the barter of a back-woods settlement. It is true that agriculture has been the last to receive the impetus of modern science. It is true that many agriculturists are content to go on in the ways of their fathers, because experiments are costly. But it is also true that they are unable to compete with those who understand the use of new instruments, methods, and fertilizers. Agriculture is also becoming in this country a popular recreation. Many a gentleman is content to spend on his country seat money which he makes in the counting-room. The practical farmer is thus able to get the benefit of experiments without paying for them. This change in agriculture, which has converted it from a drudgery to an art, has created a demand for a corresponding literature. "Fifty years ago a stable agricultural periodical did not exist on the American Continent." Now every considerable district has one, while almost every weekly paper, secular or religious, has its agricultural department; and it will not be long before something of a library will be a part of the furniture of every well-order-

ed farm. We group several books which would deserve a place in such a library.

The New American Farm-Book is a revised and enlarged edition of a work originally written by RICHARD L. ALLEN, then one of the editors of the "American Agriculturist." It has stood the test of nearly quarter of a century. In its present form, revised and enlarged by LEWIS F. ALLEN, it is little short of a small cyclopedia, and is probably the most complete and comprehensive manual of the kind now published. Our own references to it have satisfied us of its value to the amateur.—*Farm Implements and Machinery*, by JOHN J. THOMAS, is a smaller volume of a more limited value. It gives a pretty full account of modern implements, the explanations of which are aided by numerous illustrations. We doubt, however, how much the practical farmer will read the introductory pages on the general principles of mechanics. (Orange Judd and Co.)

The Horse in the Stable and the Field is a composite of three authors: J. H. WALSH ("Stonehenge"), Dr. ROBERT M'CLURE, and Dr. ELLWOOD HARVEY. It begins with the history of the horse; gives an account of the different breeds and varieties; discusses the best method of breaking, in which the principles employed by Mr. Rarey are fully explained, but not commended; gives full instructions as to the proper construction of stables; and devotes two hundred pages to the anatomy, physiology, and pathology of the horse. It is illustrated with over eighty engravings; and, on the whole, seems to us to sustain its claim to be the only work which has brought together in a single volume, and in clear, concise, and comprehensible language, adequate information on the various subjects of which it treats. (Porter and Coates.)

While the gentleman is purchasing these volumes for his farm he will do well to purchase for his wife the new edition of PARSONS *On The Rose*. For those who are not familiar with the original edition we may say that the book contains a classification of the varieties of the rose, sufficiently full for all practical purposes, directions for its culture and propagation, a curious and interesting history of it, and of the uses to which it has been put. For those who are familiar with the original edition we may add that this one is improved in arrangement, modernized and enlarged in classification, and by a judicious pruning of poetry rendered less sentimental and more useful. (Orange Judd and Co.)

Farming by Inches is uniform with "My Ten Rod Farm" not only in shape and size, but also in that halo which it casts over the subject, and which it certainly requires only a few months of practical experience to dissipate. When by a perusal of "Farming by Inches" the reader has been incited to "take up the shovel and the hoe," we recommend him to resort to the less romantic books to learn how to use them. (Loring.)

MISCELLANEOUS.

THE woman's suffrage movement has assumed such proportions and has secured such advocates as render it impossible to treat it any longer as a mere intellectual *émeute*. Its supporters are no longer confined to that small class of Ishmaelish reformers (whose hand is against every man,

and against whom every man's hand is raised) useful but neither pleasant nor popular. The war they carry on is no longer an unrecognized brigandage. Parties are forming. Armies are being enlisted. The skirmish line is followed by heavy reserves. Among the clergy it enlists the sympathies and support of such men as Henry Ward Beecher and Bishop Simpson. Among statesmen it is advocated by men of no less note than the Chief Justice of the United States. The long and apparently hopeless labors of Lucy Stone, who for ten years past has beset every Legislature with appeals, arguments, and petitions, are rewarded by an almost unanimous report from a Committee of the Massachusetts Legislature in favor of female suffrage. It is idle any longer to attempt to stem the movement by stale platitudes or staler ridicule. The question is before Americans for earnest discussion. Its advocates number many thoroughly earnest men, a few thoroughly earnest women. It must be met, if at all, in the same spirit.

We have read with amazement Rev. J. D. FULTON's little tract on the subject—*True Woman*. We were at first of the opinion that its reverend author was, as Artemus Ward would say, "sarcastical." We regarded his treatise as a travesty—rather an unfair one to be sure—of the conservative arguments. We thought it had been written by an ingenious humorist who advocated radical principles under cover. We are not even now sure but that our first impressions were correct. We confess to having become somewhat weary of the conventional encomiums on woman. We were not, however, prepared for such an antidote as our author administers. "Woman," says Mr. Fulton, "is made for man." "She is God's first gift to him." Her mission in life is to help him. "She lives for man. She dresses and studies for him." He is the sun. She is a satellite. About him she is to revolve. By her use to him she is to be measured. She was historically a sort of after-thought made because none of the brute creation were found adequate to be his helpmeet. The Indian in setting his squaw to cultivate his garden is guilty only of an error in judgment. If he knew enough he could put her to a better use. That is all. Her equality with her master is not to be thought of. It is against Scripture. The Bible says he shall rule over her. It is against science. "Man's brain weighs on an average three pounds and eight ounces, woman's brain weighs on an average two pounds and four ounces." It is against experience. "You can not offend a woman so quick in any way as to ask her why she wishes to do thus, or why she reaches such a conclusion. Her invariable reply is 'cause! And that is all she knows about it." It is true she has warm feelings and quick intuitions. Her imagination and fancy have a lively play. "But she will never write an Iliad or a Paradise Lost.....She will not paint a Madonna like Raphael, nor chisel an Apollo Belvidere.....Woman seldom invents.....Woman can not compete with man in a long course of mental labor.....Woman never excelled in architecture." This is not the worst, however. Her inferiority appears in the moral realm. She was the tempter. "A wicked woman *was*, and to a large extent *is*, the means employed by Satan in leading astray the unwary." The daughters of Eve have proved

worthy descendants of their mother. "Sarah introduced Abraham to polygamy. Rebekah was a pattern of lying, and Rachel of deception." Her curiosity, which was the cause of the fall, is as influential as ever. "Rouse a woman's curiosity, and there is little difficulty in leading the excited one astray." The love of companionship in sin, which led her to tempt Adam to share her fate, still actuates her. "A man loves to have a woman pure, if he is impure; temperate, if he is intemperate; holy and Christian, if he is the opposite in every particular. Not so a woman. Intemperate herself, she seeks to induce others to be like her." This is the more remarkable since she is so much better off than her first mother. For "by her office and place she is protected *from all danger and temptation.*" (The Italics are ours.) "Within the house as ruled by her need enter no danger, no temptation, no cause of error or offense." This moral inferiority society recognizes. "Let her fall, and almost without exception she is hopelessly ruined. Society points the finger of scorn at her; and, what is worse, the barriers to virtue having been broken down they seem to be destroyed." Against this violation of love Jesus, it is true, set the weight of his precept and example. Rev. Mr. Fulton seems to account it in accordance with the divine constitution. God, according to him, shares this sentiment with humanity. "God did business with Adam; but he does not mention Eve after her fall." The conclusion of all which principles, interspersed with many patronizing eulogies of woman as long as she maintains her place, is this, that her place is that of subordination. "Her desire shall be to her husband, and he shall rule over her." This fixes her status. He is master. She is—what? Shall we, speaking for Mr. Fulton, say servant? To deny this is to be infidel. "Who demand the ballot for woman? They are not the lovers of God, nor are they the believers in Christ as a class. There may be exceptions, but the majority prefer an infidel's cheer to the favor of God and the love of the Christian community."

Such is in substance the position of the last opponent of the woman's movement, given as far as possible in his own words.

If Mr. Fulton desired to compel woman to demand the ballot he could not have drawn his bow with a surer aim. Man does not deny suffrage to woman. She declines it. The strongest argument, perhaps, against the extension of the suffrage is, that as a class women do not want it. But if Mr. Fulton can only succeed in convincing them that the denial of the ballot is the badge of their inferiority, and that its possession is essential to a recognition of their civil and social

equality, he will extort from them—if we do not greatly mistake woman's nature—such an imperious demand for the ballot, not for itself but for its significance, that no political party can resist the claim. If the Equal Rights Association would take our advice they would print 50,000 copies of Mr. Fulton's tract for general circulation among the women. That party have no advocate in their camp capable of producing so profound an impression in their favor as Mr. Fulton's pamphlet aimed against them. The shot of this gun is ridiculously feeble. Its recoil is fearful. (Lee and Shepard.)

It is evident that the Bible, while retaining its ancient sanctity as the record of faith, is now taking a new part in the literary movements of the age, and sharing, alike as to its language and its ideas, in the studies and agitations of the nineteenth century. There is hardly any fact in our recent literature more memorable, for example, than the publication of the new English version of TISCHENDORF'S *New Testament* as the one thousandth volume of the Tauchnitz Library at Leipsic: thus giving the Gospel, in new dress, the place of honor in the most select if not the most sensational popular library of the age. Dr. Noyes, in his new translation, follows Tischendorf's eighth edition so far as it was published in 1868, and accepts the previous edition for the remainder. That accomplished critic and scholar, Mr. Ezra Abbot of Cambridge, has added some corrections of the text from Tischendorf's later studies, so that the volume is now a full and fair record of the present state of the New Testament text. The translator aims to render the text as it stands, and give its true meaning without transferring his own opinions to the sacred writer's pen. Of course every man must carry with him his own convictions; and it is hard for the theologian to keep the print of his own views out of his vocabulary, and even out of his grammar and his rhetoric. Yet no candid scholar will accuse Dr. Noyes of unfairness or sectarianism, so far as theological opinions are concerned. The excellence of his version is in its earnest good sense, simplicity, and clearness. Dr. Noyes retains the old version so far as he can, and delights in its dignity and strength, but he is not afraid to untie a knotty sentence that puzzles the understanding, or brush away a cobweb that obscures the meaning. In the Epistle to the Romans, for example, the translator's terse and simple language is itself a good interpretation, and opens the mind of Paul in his own words without any dogmatic gloss. The book deserves a place in every scholar's library, and will be a gain to every Christian family. (American Unitarian Association.)

Monthly Record of Current Events.

UNITED STATES.

OUR Record closes on the 28th of May.—The prominent events of the month are: The completion of the Pacific Railroad; the Proclamation by the President for an Election in Virginia; the excitement in Great Britain growing out of Mr. Sumner's speech; the French Elec-

tions; the debates in the Spanish Cortes; and the progress of the insurrection in Cuba.

The 10th of May will be noted as the day upon which the construction of a railroad from the Pacific coast to the Missouri River, and thence virtually, by lines already completed, to every part of the great Valley of the Mississippi

and the whole Atlantic coast, was finally accomplished. We do not here propose to present the details of the immense preparatory work performed before the enterprise was fairly started; nor to say to which one, out of many scores for whom the credit has been claimed of having suggested the idea, the honor should be awarded. Within a short time after the value of the region of the Pacific slope was approximately ascertained, it became a settled conviction in the public mind that one or more railroads must be built to connect the Atlantic with the Pacific. Many routes were proposed, the arguments for each being based mainly upon sectional grounds as to whether the line should be northern, central, or southern. In 1853 Congress authorized the War Department to institute a series of surveys of the various routes proposed. The results of these surveys, comprised in thirteen folio volumes, were published. Jefferson Davis, then Secretary of War, recommended a line mainly following the 32d parallel of latitude.

Nothing practical was done until July, 1862, when Congress passed an act granting aid in the construction of a railroad and telegraph line from the Missouri River to the Pacific Ocean. An association named the Union Pacific Railroad Company was empowered to build the line from a point in Nebraska Territory to the western boundary of Nevada, and there connect with the line of the Central Pacific Railroad Company, which had been already chartered by the Legislature of California. The whole line, from the Missouri to the Bay of Sacramento, was to be completed not later than July 1, 1876, and the Company first reaching the boundary line might proceed until it met the other. The aid promised by Government was of a substantial character. The Company was to have the right of way through the Government lands for 200 feet on each side of the track; besides this the Company received a grant of ten alternate sections to the mile on each side of the railroad, with the right to use material upon Government lands. Moreover, the Government promised its bonds, the interest payable in gold, at 6 per cent., at the rate of \$16,000 per mile for the whole road; but for certain parts, amounting in all to about 150 miles, which were of especial difficulty, \$48,000 per mile was granted. For the Californian section the uniform grant was \$32,000 per mile. These issues of bonds were to be made only upon the certificate of Commissioners appointed by the Government that sections of twenty miles had been duly completed and thoroughly equipped as a first-class railroad.

With all these possible advantages the work at first advanced but slowly. The Pacific Union Company was organized in 1863, with a nominal capital of \$100,000,000, but with the right to proceed when \$2,000,000—a fiftieth part of the whole capital—was actually subscribed. It was hard to get even this two million of dollars. But it was finally raised, and the Company began to work. Omaha, on the Missouri River, was fixed upon as the starting-point, from which the work was to be pushed westward. Thence to Salt Lake City was a distance of something more than a thousand miles. Here, or hereabouts, it was expected that the junction would be made with the road to be pushed eastward by the Pacific Central from Sacramento. The first actual work on

the Union Pacific road was begun in August, 1864. Three months later 12 miles had been constructed, and the occasion was duly celebrated. The next year, 1865, 28 miles more were built. At this rate it would take more than a third of a century to reach the point of junction, near the Mormon capital. The work now fell into the hands of men who were resolved to "push things," no matter at what cost. Heretofore a mile a day had been the utmost at which any railroad had ever been built. This rate was soon reached. In 1866 265 miles were built; next year 235 miles. In 1868 the work was pushed forward with a rapidity heretofore unknown. For weeks four miles a day was the usual rate at which rails were laid; and early in May, 1869, the thousand miles and more from Omaha to the head of Salt Lake had been built.

Meanwhile the Central Pacific Company had been pushing on their road to meet their eastern coadjutors. The line as originally planned was to run to the south of the Great Salt Lake, passing through Salt Lake City. It was changed so as to bend northward, passing the Salt Lake at its northwestern extremity; from this road a branch road of some fifty miles in length must be built to connect the sacred city of the Mormons with the continental line.

The ceremony of placing the last tie of the united roads was performed with as much display as was possible. The scene was a grassy valley at the head of the Great Salt Lake. About 3000 people of all sorts had here congregated. Among them were many men who had borne a prominent part in the construction of the road. The final tie was of polished laurel-wood, bound at the ends with silver bands. A golden spike sent by California, and a silver one by Nevada, and one of gold, silver, and iron by Arizona, were presented. These spikes were driven home by the representative officers of the two Companies by whom the roads had been constructed. Prayers were offered and some speeches made. Arrangements had been made by which the strokes of the hammers were connected with the telegraphic wires; and almost at the instant it was known on the Pacific and the Atlantic that the junction of the roads had been completed. The New York newspapers of the morning of the 12th contained a dispatch from San Francisco announcing that at the moment when the last spike had been driven an invoice of tea had been sent by the road, thus, as the dispatch read, "inaugurating the overland trade with China and Japan."

The length of the Union Pacific road, from Omaha to Ogden, is 1086 miles; that of the Central Pacific, from Ogden to Sacramento, is 690 miles—1776 in all. From Sacramento to San Francisco, 124 miles, a road has been built. It is impossible to state with any accuracy the entire cost of the construction and equipment of these roads. Apart from grants of land and material, the subsidies afforded by Government amount to \$52,000,000, of which \$26,000,000 have been paid to the Union Pacific, and \$20,000,000 to the Central Pacific, leaving \$6,000,000 yet due to the roads. There can be no doubt that much of the roads has been hastily and imperfectly constructed; but in September of last year a Commission appointed by Government, headed by General Gouverneur K. Warren, reported upon

890 miles of the road then in operation: "Deficiencies exist, but they are, almost without ex-

ception, those incident to all new roads, or of a character growing out of the peculiar difficulties encountered or inseparably connected with the unexampled progress of the work. They can all be supplied at an outlay but little exceeding that which would have obviated them in the first instance, but at the cost of greatly retarding the progress of the great work."

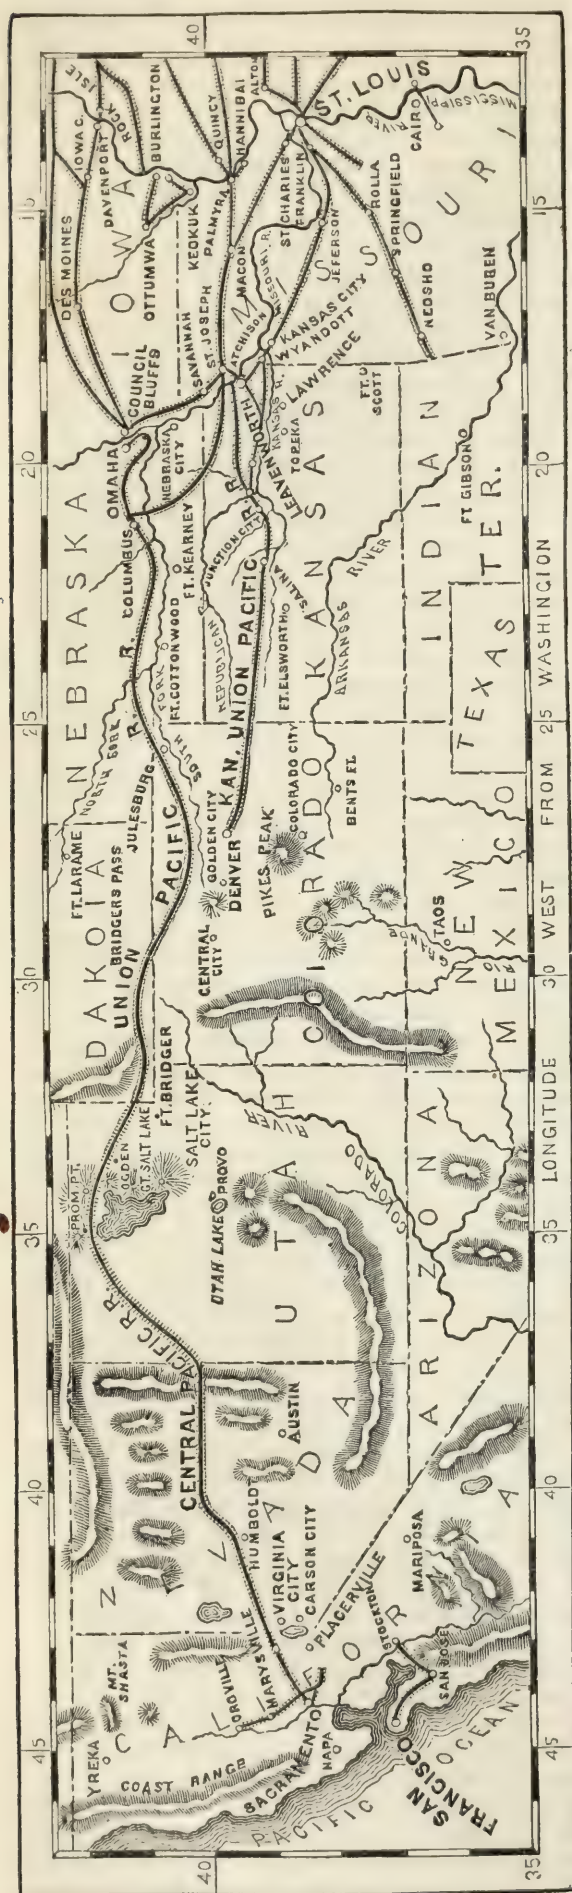

The accompanying map shows the general line of the two roads, which together may be called the Pacific Railroad. It runs almost due west, following closely the 41st parallel of latitude, bending southward a little when it approaches the Pacific coast. The map also indicates the railroads which, centring at Omaha, run in every direction, connecting this place with the Valley of the Mississippi, the Lake region, and the Atlantic sea-board. It is useless now to attempt to locate the towns which are every day springing up on the line of this long road. It passes in its course four distinct ranges of mountains: (1.) The Sierra Nevada, the highest elevation, about 100 miles from Sacramento, is 7042 feet; then it sinks gradually, but with alternate risings and fallings, to Ogden, 4320 feet. (2.) Then it climbs the Wasatch range, the highest point, 800 miles from Sacramento, being 7500 feet, whence it sinks 1500 feet; and (3.) climbs the Rocky Mountains through Bridger's Pass, where, 1000 miles from Sacramento, it gains a height of 7500 feet. Thence it runs nearly level for fifty miles, when (4.) it ascends the Black Hills, the summit, 1250 miles from Sacramento, being 8242 feet above the ocean. Then the region slopes gradually downward for 500 miles, to Omaha, which is about 1000 feet above the ocean level. There are thus four several points where the road reaches an elevation higher than the loftiest peak in America east of the Mississippi River.

No two measurements of the absolute distance by the traveled routes between New York and San Francisco exactly agree; but the sum of the discrepancies hardly amounts to a hundred miles. It is as yet impossible to lay down the precise time which will be required for the transit. The following table is a close approximation to what is proposed to be accomplished; the whole time being a few hours less than a week:

New York to Chicago	911 miles,	36½ hours.
Chicago to Omaha	491 miles,	24½ hours.
Omaha to Ogden	1091 miles,	55½ hours.
Ogden to Sacramento	743 miles,	43½ hours.
Sacramento to San Francisco	117 miles,	3½ hours.

3353 miles, 161½ hours.

Of the commercial value of this road it is yet too early to speak with confidence. Four points, however, may be assumed: (1.) The heavy articles which enter into commerce will not pass over the line. The saving in time will not compensate for the heavy charges which must be imposed. (2.) The "way traffic" upon the line will for many years be inconsiderable. A great part of the road runs through a region which will always be very thinly peopled. (3.) Assuming that the road will be operated with tolerable accuracy, nearly all the passengers between the Pacific and the Atlantic will pass over this road. By it a person starting from San Francisco will reach New York in a week. By way of the Isthmus of Panama he would require nearly a month. (4.) The political uses of the road are

incalculable. In case of war with a maritime power, our Government can transport an army to the defense of any point on the Pacific, without any possibility of obstruction from the enemy; whereas, were a force sent by sea, the vessels conveying it would be liable to capture either on the Atlantic or the Pacific side; to say nothing of the possibility that transit across the Isthmus of Panama might be blocked up. In this single point of view every dollar which the Government has expended in aiding the construction of this road has been wisely laid out.

In accordance with the Act for that purpose, noted in our last Record, the President, on the 15th of May, issued a proclamation for an election in Virginia, to be held on the 6th of July, to decide upon the ratification or rejection of the Constitution framed for that State by a Convention which met in December, 1867, and adopted this Constitution in the following April. All persons who on the 6th of July, 1869, have been registered as electors may vote upon this question. Two clauses in this Constitution are submitted to a separate vote.

The first of these clauses excludes from enfranchisement—

"Every person who has been a Senator or Representative in Congress, or Elector of President or Vice-President, or who held any office, civil or military, under the United States, or under any State, who, having previously taken an oath as a member of Congress, or as any officer of the United States, or as a member of any State Legislature, or as an executive or judicial officer of any State, shall have engaged in insurrection or rebellion against the same, or given aid or comfort to the enemy thereof." [Then follows a long list of the officers included in this clause.] "Provided that the Legislature may, by a vote of three-fifths of both Houses, remove the disabilities incurred by this clause from any person included therein, by a separate vote on each case."

The second clause submitted for separate vote prescribes, in substance, that almost every person elected to a civil office, before entering upon the duties thereof, shall take the following oath, provided, however, "that the disabilities therein contained may be individually removed by the three-fifths vote of the General Assembly:"

"I do solemnly swear [or affirm] that I have never voluntarily borne arms against the United States since I have been a citizen thereof; that I have voluntarily given no aid, countenance, counsel, or encouragement to persons engaged in armed hostility thereto; that I have never sought or accepted, nor attempted to exercise, the functions of any office whatever under any authority or pretended authority in hostility to the United States; that I have not yielded a voluntary support to any pretended Government, authority, power, or Constitution within the United States hostile or inimical thereto. And I do further swear [or affirm] that, to the best of my knowledge and ability, I will support and defend the Constitution of the United States against all enemies, foreign and domestic; that I will bear true faith and allegiance to the same; that I take this obligation freely, without any mental reservation or purpose of evasion; and that I will well and faithfully discharge the duties of the office on which I am about to enter, so help me God."

The Proclamation then goes on to prescribe the manner of casting the vote, as follows:

"I direct the vote to be taken upon each of the above cited provisions alone, and upon the other portions of the said Constitution in the following manner, viz.: Each voter favoring the ratification of the Constitution, excluding the provisions above quoted, as framed by the Convention of December 3, 1867, shall express his judgment by voting for the Constitution; each voter favoring the rejection of the Constitution, excluding the provisions above quoted, shall express his judgment by voting against the Constitution. Each

voter will be allowed to cast a separate ballot for or against either or both of the provisions above quoted."

Serious difficulties have arisen in Alaska. The only official account of these is furnished in a report by Admiral Craven, dated March 31. In the previous winter two American traders had been killed by the Kake Indians in revenge for the death of a native killed by a United States soldier. The steamer *Saginaw* was sent, in February, to the region, and destroyed several native villages, apparently without the loss of lives on either side. "It is believed," says the report, "that the burning of the villages would be a far greater punishment than the arrest and execution of the murderers, as the Indians in that region are said to place little value on life, whereas their houses can not be replaced without great labor and time."

The bearing of the "eight-hour law" upon the rate of wages to be paid to mechanics and laborers in the employment of Government has been a matter of question. On one hand it was contended that the wages should be reduced in the ratio of the reduction of time; on the other that the rate of wages should not be changed. On the 21st of May the President issued a proclamation that "no reduction shall be made in the wages paid by Government to laborers, workmen, and mechanics, on account of such reduction of the hours of labor."

The General Assemblies of the two branches of the Presbyterian Church—the "Old School" and the "New School"—convened at New York on the 20th of May. On the 27th a plan for the union of these two organizations, which had been framed by a joint committee, was adopted, by the New School unanimously, and by the Old School by a vote of 257 to 8. Its essential provision is:

"The reunion shall be effected on the doctrinal and ecclesiastical basis of our common Standards; the Scriptures of the Old and New Testaments shall be acknowledged to be the inspired Word of God, and the only infallible rule of faith and practice; the Confession of Faith shall continue to be sincerely received and adopted as containing the system of doctrine taught in the Holy Scriptures; and the government and discipline of the Presbyterian Church in the United States shall be approved as containing the principles and rules of our polity."

This plan is to be submitted to the several Presbyteries, who are to report their action on or before the 1st of November to the clerks of the present General Assemblies, who are to meet at Pittsburg on the second Wednesday of that month. If two-thirds of the Presbyteries accept the plan it is to take effect, and the General Assembly of the united Church is to meet at Philadelphia on the third Thursday of May, 1870.

CUBA.

We are gradually acquiring some definite information as to the course of events in *Cuba*. About the 10th of April delegates met at Guimaro and formally organized a republican government, Don C. M. Cespedes being President, and Manuel Quesada Commander-in-Chief of the Army. Cespedes, in accepting the position, declared that, "in the act of beginning the struggle with the oppressor, Cuba has assumed the solemn duty to consummate her independence or perish in the attempt." The contest, which up to a very recent period has been rather of the nature of a guerrilla warfare, both parties claiming great advantages, has assumed a merciless

character. In February Céspedes issued an order that "Every prisoner who has voluntarily fought against the revolution shall be executed; but soldiers of the regular army may expect clemency according to the circumstances; the property of enemies of the republic will be confiscated; no neutrality will be recognized; all persons will be considered friends or enemies, with the exception of foreigners who have been neutral since the beginning of the revolution. Those who have voluntarily done the Spanish Government or its officials any service will be executed irrespective of person." In April General Valmaseda, commander of the Spanish forces, put forth a decree of a character quite as atrocious.—Expeditions from the United States have succeeded in joining the insurgents; and sharp actions are reported. Thus, according to Spanish accounts, on the night of the 16th of May 700 men landed in the bay of Nipe, and took up a position in which they were surprised by the Spaniards, who gained some advantage; but their ammunition giving out, they were compelled to retire. According to the official Spanish account they lost four men killed, while the enemy lost 60 killed and 160 wounded.

EUROPE.

In *Great Britain* the speech of Mr. Sumner, noted in our last Record, has aroused universal attention. The newspaper press, almost without exception, look upon this speech as an official declaration by the Government of the United States, and as amounting virtually to a threat of war, in case the demands made are not complied with. The universal feeling in Great Britain is that the utmost that will be conceded is reparation for actual damages inflicted by the *Alabama*; and that in no case will any apology be made for the recognition of the belligerent rights of the Southern Confederacy.—Mr. Motley has already proceeded to Great Britain to assume the position of Minister from the United States, but the instructions under which he is to act have not been made public.

In *France* the election for members of the Legislative body closed on the 25th of May. Some time previous the Emperor made a speech at Chartres, in which he urged the voters to "second the regular advance of my Government on the path of liberal progress which it has laid down, and to oppose insuperable resistance to those subversive passions which appear to revive only to threaten the unshaken fabric of universal suffrage." The election was attended with much excitement; and the result appears to be that the Opposition gain a few members. In 59 districts the vote was so close that another ballot will be necessary. Of the candidates already chosen 41 were not members of the last Chambers.

From *Spain* we have only the brief notes sent by telegraph, which give no clear idea of the progress of events. The only things certain are that the Cortes has been considering the new Constitution; that a monarchical system of government is decided upon; but that no person has been fixed upon to wear the crown. We give briefly the sum of the most important dispatches:

April 30. Yesterday Señor Cuestas proposed an amendment to the new Constitution now under consideration, establishing the Catholic as the only religion of the country. After debate it was rejected.

May 1. An amendment to the Constitution, abolish-

ing the prerogative of the Crown in Ecclesiastical matters, was rejected.

May 2. All amendments proposed to the new Constitution have been rejected. The Cortes has voted an amnesty for all prisoners who took part in the insurrection at Cadiz, Malaga, and Xeres. A motion that the amnesty should be extended to Carlists implicated in insurrectionary movements was not agreed to. A serious disturbance at Saragossa is apprehended. It is reported that the troops there are in a state of discontent and partial insubordination.

May 4. The majority of the Cortes are in favor of a new Ministry.

May 5. Olozaga and his friends demand the establishment of a Directory; it is believed that General Prim is not unfavorable to the scheme.

May 6. The article of the Constitution guaranteeing liberty of worship was adopted, by 164 to 40. Serrano urged a postponement of the contemplated ministerial changes until a form of government had been definitely settled upon, which was agreed to. A Carlist conspiracy has been discovered at Barcelona.

May 7. All the amendments to the religious clauses of the Constitution were rejected, and the clauses as they stood were finally adopted. A Directory is proposed, to consist of Serrano, Rivero, and Olozaga, with Prim at its head, as President and Minister of War.

May 8. A proposition has been made to the Cortes to name Serrano as Regent, and Prim as President of the Council, until a King is elected.

May 9. Prim declared that the reports that he meditated an attempt against the liberal régime were unfounded; his motto, he said, was "honor and liberty." There are reports of Carlist risings in Catalonia.

May 10. The question of the reacquisition of Gibraltar came up in the Cortes. The Minister of State said that before any treaty for its cession by Great Britain could be negotiated, the Spanish nation must be strongly constituted and financially reorganized.

May 14. In the Cortes Señor Orense made a speech in favor of the formation of a federal republic.

May 15. The Cortes, by a vote of 182 to 64, rejected the amendment to make Spain a federal republic. A proposition to create a triennial Directory was under consideration. This scheme was rejected on the next day.

May 17. The article of the Constitution declaring that the "sovereignty is in the nation, from which all power emanates," was adopted by acclamation. Amendments that the King must be a native of Spain, and elected by popular vote, were rejected. The majority of the Cortes, fearing that a civil war is imminent, favor a regency.

May 21. After sharp debate, the article of the Constitution declaring that "the form of government of the Spanish nation is a monarchy," was passed by a vote of 214 to 70. In the course of the debate Admiral Topete said that he was opposed to the restoration of Queen Isabella; he desired the elevation of the Duke of Montpensier to the throne, but should subordinate his action to that of the Prime Minister and the Minister of War, who, as all the other Ministers, awaited the decision of the Cortes for their guidance. Topete concluded by advising the Cortes to "take care that no daring man should cut the knot which they were unable to untie."

May 22. The republican newspapers assert that the vote of the 15th only deferred, but did not defeat the scheme for a federal republic, which they aver must come, sooner or later, through the want of a monarch and the absence of unanimity on the part of the majority of the Cortes. Queen Isabella proposed to abdicate in favor of her son, the Prince of Asturias.

May 23. Admiral Topete was appointed Minister of the Colonies, *ad interim*. Prince Augustus, of Portugal, has been suggested for the Spanish throne, it being reported that negotiations were in progress for a marriage between him and a daughter of the Duke of Montpensier.

May 26. The Cortes is debating the clauses in the Constitution relating to the colonies. Señor Castellano said that if Spain had, in regard to Cuba, followed the example of Great Britain in Canada, the outbreak would have been prevented. Serrano replied that General Dulce, when he entered upon the government of Cuba, had granted the liberties required, but that party-spirit had blinded some of the inhabitants as to the intentions of the Home Government. The rebellion had been suppressed by physical force, but the moral disorder was disappearing very slowly. When public order was restored slavery would be abolished by the Government, and all persons engaged in the slave-trade would be punished.

Editor's Drawer.

THE Drawer has many little anecdotes of our warriors, big and little, but never until now one of an officer whose military record is among the best—General Slocum. In a lecture recently delivered by that gentleman he illustrated the amount of influence possessed by officers over men, and the high state of discipline that prevailed during the first months of the war, by the following incident that occurred at the battle of Bull Run during the heat of the action. An officer who has since become prominent and well-known throughout the country was then in command of a brigade on the right of the line. While riding over the field he discovered a soldier concealed in a hole in the ground, which was of just sufficient dimensions to afford him shelter. The General rode up to him, inquired as to his regiment, and ordered him to join it at once. The man looked him full in the face, placed his thumb upon his nose, and replied: "*No, you don't, old fellow; you want this hole yourself!*"

EVERY thing seems to flourish in Illinois, especially sects; realizing the accuracy of the French gourmand's statement, namely, that in that State there were "two hundred and seventy religions and *one gravy*." In that famous commonwealth, in Woodford County, the dominating piety is that of the Dunkers, who are notably strict in the observance of certain ceremonies—among them that of kissing each other and washing each other's feet. Not long since the members of this society were assembled from all parts of the county to enjoy the annual reunion. Provided with vessels of water, and seated on two long rows of seats, they proceeded to the foot-washing. At the conclusion of this moist ordinance a Dunker divine arose and remarked that he was sorry to observe a Methodist brother present who had declined to join in the solemnity. After some reference to the imperative duty devolving upon Christians to wash each other's feet, he concluded with: "If our Methodist brother has any thing to say we shall be glad to hear from him." The Methodist brother, a minister, arose and said: "It's all right, friends; all right—at least *I should think so from the looks of the water!*"

WE see no reason to doubt the accuracy of the inference of a clergyman in Leesburg, Virginia (probably some army chaplain, as it occurred during the war), who, in dilating on the cure of Naaman, said: "I have no doubt when *Mr.* Naaman reached home, after his bath, that *Mrs.* Naaman was glad to see him."

Probably. The Drawer never reads one of these watery anecdotes without being reminded of a saying of Thackeray, viz., that the people of this world would be all the better if they would become "Companions of the Most Noble Order of the *Bath*."

A CORRESPONDENT at Corning, New York, mentions that a deep religious feeling has been prevalent in that town, and that the prayer-meetings have been very numerously attended. During one of these meetings a good Methodist lady made a fervent exhortation, and illustrated

it with an anecdote of an actress. She prefaced it with the remark that she once enjoyed herself in attending theatres. In which the "leading man" of the meeting joined by shouting, "So did I—*bless the Lord!*"

JUST before the battle of Buena Vista the Mexicans were indulging in a few odd shots with escopete balls, the whistling of which leaves an impression never to be forgotten. The division of General Joe Lane, of Indiana, was in battle array, and in it his favorite Indiana regiment. Placing himself in front of this regiment, he observed the heads of the boys bowing whenever these whistling shots came by, and indignantly gave the command, "Indiana regiment, no dodging!" This had the desired effect; but soon came whirling along a twenty-four-pounder, and down went the General's head with the rest: whereupon he immediately faced about, and with stentorian voice exclaimed, "Indiana regiment, *dodge the big ones!*" That order was obeyed.

AT this same battle General Lane had placed upon his staff a brave young officer who stammered, and when excited was scarcely able to talk. The night after the fight General Taylor sent for his division commanders for a council. Before Lane left his quarters to attend he ordered the young officer to ride to a prominent hill, observe the Mexicans, and bring information immediately of any movements; to stay all night, if necessary, but be sure to give the first news of their movements. The conference was long. After returning to his tent he was unable to sleep. Next morning, just at dawn, while pacing in front of his tent, he saw his aid-de-camp, spurring his horse and whipping him with his sword, riding furiously. On halting before the General, so eager was he to communicate his information, he forgot the customary salute, and said: "Ge-Ge-Gen-eral, Santa Anna's re-re-re-treating, and-and-and if *he's* sat-sat-sat-is-is-fied I-I-am!" General Lane promptly dispatched this report to General Taylor, who was doubtless also sat-sat-ified.

THAT fond fathers and mothers may know what were thought to be the advantages of being born on certain days, we quote the following quaint old specimen of lip lore written many a long year ago:

"Monday's child is fair of face,
Tuesday's child is full of grace;
Wednesday's child is born to woe,
Thursday's child has far to go;
Friday's child is loving and giving,
Saturday's child must work for its living;
But the child that is born on the Sabbath-day
Is blithe and bonnie, good and gay."

THE peculiar conformation of the foot of a freed-man seems to be satisfactorily accounted for by a Belle Plain, Iowa, correspondent, who says:

A little negro passing our drug-store was accosted with, "I say, Bub, what makes your feet so long behind?" The little negro answered, "Why, massa, you see when de Lord made us niggahs he thought he wouldn't give us any feet; but when he made up his mind to gub 'em, we

was so glad dat we jumped right into de middle of 'em—dat's so!"

At prayer-meetings, as well as elsewhere, brevity is the soul of—well, let it be wit. At one of these meetings, held not a thousand miles from Fall River, the congregation was large, and as there were many who would probably be glad to participate in the exercises, brevity was essential. One of the brethren, a bluff person, acted as a sort of monitor, and more than once during the evening remarked: "Brethren, there are many from whom we wish to hear to-night; so be brief as possible." This reminder had the desired effect until a Presbyterian clergyman from a neighboring town arose to speak, and, unconsciously, ran into a long argument. Our bluff brother at length interrupted him with the hint to be limited—that there were yet many to be heard from; which was too much for the reverend, who somewhat impatiently replied: "Sir, I am a *Presbyterian* minister; I *can not* be limited!"

THE anecdote of the eccentric old farmer who had never had any falling-out with the Lord, related by a New Jersey correspondent in the April Drawer, reminds an old and welcome Jefferson County contributor of a veritable occurrence that took place some years since in one of the villages of that county. Old Mr. F—— was lying dangerously ill at his house with an affection of the liver. One day Parson B——, hearing of his critical condition, and knowing that he had never given much attention to the ordinances of the Church, determined to make him a call. He was admitted to the room of the sick man, when he affectionately observed:

"Mr. F——, you are very ill; you may never recover. May I inquire the condition of your heart?"

"Oh! heart is well enough; my liver is considerably diseased, so the doctors tell me. But my heart's all right; there's nothing the matter with that!"

NEW YORK is not without rivals in the art and mystery of advertising. If, as has been said by high literary authority, the culture of a nation may be inferred from its advertisements, how high in the scale shall we place Scranton, Pennsylvania, in one of whose organs of public opinion appears the following announcement of Messrs. —?

THEIR PARLOR FURNITURE IS ELEGANT,
THEIR BEDROOM FURNITURE IS RICH,
THEIR MATTRESSES ARE DOWNY,
THEIR COFFINS ARE COMFORTABLE.

GENERAL WALBRIDGE tells us that a spinster of Boston met an old gentleman at the house of his brother, and, imagining him to be a man of wealth, married him. They moved to Philadelphia. Too late she found out that he was poor as that only fowl possessed by the Scriptural planter, Job. She led him a horrible life; and, after several years of married infelicity, drove the ghost from the poor man's body. Quietly putting the defunct into a coffin, she sent it by express to Boston, and soon followed. Arrived there, she had body and all put on a cart, drove to her brother-in-law's house,

and ordered the driver to put the coffin on the front steps, which was done. Ringing the bell violently, she calmly waited. The door was opened by her brother-in-law and his wife. Imagine their horror at seeing the virago sitting on a coffin and smiling at them.

"In Heaven's name, what have you there?" they demanded.

"Oh, nothing. I've only brought old Jones back home."

"Wo-wo-won't you come in?"

"No! thank you. I've an *engagement* to keep!"

And with that off she tramped, leaving poor Jones in his coffin, and his brother cursing her and all womankind as long as she was within hearing. Her grief was hardly first-class.

A CHICAGO correspondent mentions the case of an old mulatto who belonged to an acquaintance. The old mulatto was asked if he was legally married to the woman whom he called his "wife;" to which he replied: "Yes. We had no minister, but we took a-hold each other's hand, knelt down together, and I axed her if she'd be my wife till death. She said yes; and axed me if I'd be her husband till death. I said yes; and then *we took de Lord's name in vain*, and we was lawfully married!"

WILLIAM PRESTON, an Englishman and a stone-cutter, had been employed by Mrs. Hereford, the daughter of James Wilson, an eminent Scotch lawyer of Charlestown, Kanawha County, Virginia, deceased, to erect a tombstone over his grave. For a proper inscription he was directed to call on George W. Summers, Benjamin H. Smith, and James Craik, all leading members of the Charlestown bar. They assembled in the office of Mr. Summers, in the summer of 1833—Preston present, waiting for the epitaph. They had a discussion. All agreed that something brief and in character with the deceased should be chosen. Wilson was a man of fine education, and a lawyer of great eminence and integrity—not unlike Webster in compactness. After much talk, they were all delighted with an epitaph proposed by one. It was put in writing, and given to Preston, in these words:

JAMES WILSON.

Born in Glasgow, Scotland, A.D. ——. Died in Charlestown, A.D. ——.

"A learned man and an honest lawyer."

Preston took it and went off. A student (Doddridge), reading Blackstone, ventured to suggest, modestly, that the selection seemed to imply that an *honest lawyer* was a *rara avis in terra*. He proposed to substitute the following:

"A learned lawyer and an honest man."

This was forthwith accepted, Preston recalled, and the epitaph modified accordingly. Mr. Summers quietly remarked: "Gentlemen, we must at least *appear* to respect the opinions of the world on this delicate point regarding our profession."

WITH the praiseworthy end in view of putting a stop to the absurd custom of dedicating books to distinguished persons—a custom very common nowadays, and one which we can not but think would be more honored in the breach than

the observance—we lay before our readers for their entertainment an inimitable dedication, written by the famous wit, Theodore Hook. It was prefixed to a little comedy entitled "The Trial by Jury," published in 1811. In despair of rivaling this amusing performance, we trust our authors will abolish from their future books dedications, which always appeared to us to savor too much of flunkysim:

TO BENJAMIN WADD, ESQ.

SIR,—The many private favors I have received at your hands would excuse the liberty I take in thus publicly addressing you, but the justice I, in common with every Englishman, owe to your great and splendid character renders all apology unnecessary.

As the colleague of Pitt, the associate of Fox, and the school-fellow of Nelson, you are entitled to the nation's attention; but when I come to consider the numberless acts of your comprehensive mind for the public good I feel inclined to worship you as a superior being sent from heaven to bless and benefit mankind.

It is by a close adherence to the system so admirably laid down in your "History of Naval Tactics" that our fleets have become the pride of the seas and the terror of our enemies; it is by the introduction of your regulations that our army has attained the eminence it now possesses—in short, to you the great Wellington himself is indebted for those victories which will transmit his name to posterity in the annals of fame.

The exalted station you hold, combined with the extraordinary share of talent you possess, renders you an object of the greatest interest to the nation—every body speaks of you; all eyes are fixed on you. The line you have chosen in politics, domestic and foreign, has stamped you a *true* patriot; it proves the integrity of your zeal and the purity of your heart.

The part you took in the Union with Ireland displayed the same mildness of disposition which you evinced when the expedition to Walcheren failed partially of its ultimate object; and though the very ostensible post assigned to you at home gives you an opportunity of forwarding the interests of the oppressed Portuguese nation, I am inclined to attribute the flourishing state of the allied armies at this moment to your personal exertions on the Peninsula.

Your skill in the *belles-lettres* and fine arts I shall not mention; indeed, the splendid exhibition of your own works, so liberally opened to the public, speaks volumes. You blend the boldness of a Titian with the minute finishing of a Dow, and unite the comicality of Teniers with the elegance of Vandyck. As a poet I have no hesitation in pronouncing that you are equalled by few; as a linguist surpassed by none. The beautiful collection of Persic odes which you originally wrote, and afterward translated into Dutch, have gained you a never-failing wreath; and the exquisite Chinese lectures on chess, printed in the fifth volume of the *Waddiana*, have added fresh laurels to your brow.

In the midst of all this brilliancy your very elaborate Lexicon shows your indefatigability for the improvement of mankind; and your Latin and French grammars, with your seven volumes on Mathematics, prove the versatility of your talents, as well as your steadiness in the application of them.

As a philosopher, a lawyer, a patriot, a statesman, and a gentleman you are unrivaled: but why need I repeat this truth, which England so readily allows?—it is indelibly graven on the hearts of your countrymen. With your name attached to it my little piece may reach posterity. Though nations may perish and kingdoms decay, the name of WADD will ever be remembered till Time shall cease to be.

I am, Sir,

Your most obedient

And very humble servant,

THE AUTHOR.

WHISKY is a fluid used chiefly, either "neat" or in toddified combination, as an intoxicator of man. Not until now has it been applied with success to the inebriation of rat and crow. It came to pass recently that the maid-servant of an agriculturist in Illinois conceived the idea that as whisky was killing many men in the neighborhood, it might possibly be made useful as an

exterminator of rats; so the maid-servant of the agriculturist took an ordinary "horn" of the article, made it sweet with sugar, crumbled some bread therein, and placed it in the cellar. A few hours afterward she went down and found several rats, gloriously fuddled, engaged in throwing potato parings, and hauling one another up to drink! No doubt about it.

But, accurate as this is, it is surpassed by an occurrence that recently took place in Napa, California, where the crows had made themselves obnoxious by their persistent invasion of the corn-fields. A man who had been hired to watch a particularly promising field, and notify these birds that it was against the rules to pick up any thing therein, bethought himself how he could make a "soft thing" of it for himself, and at the same time meet the requirements of his contract. Finally, by a beautiful instinct, he hit upon the plan of soaking some corn in whisky and placing it in the field, so that the crows would eat it and get drunk, and thus enable him to have a sure and easy thing of killing them. He had tried the shot-gun, but crows smell powder a long way. After soaking some corn overnight he put a good supply in the field next morning, and in two or three hours went out to see how things were progressing. Mark you the result: One of the crows a little larger than the rest had taken possession of nearly all the corn, had built himself a bar out of some clods of earth, and was retailing the whisky-soaked corn to the other crows, charging them three grains of sprouted for one of soaked grain! The man thought the manœuvre so human that he killed not a crow, but came back to the house and took a "nip" himself.

Is it actionable to use language like the following:

"I am sitting on your crinoline, Madam," said a gentleman to an overdressed woman recently in a Providence street-car.

"It is of no consequence," she politely replied, with a gracious smile and inclination of the head.

"But *I* think it is," replied the gentleman; "for it hurts me."

Not bad by an English wag, who, in speaking of the elaborate suppers served on a North River steamer, where for seventy-five cents you may partake of a banquet the variety of whose bill of fare rivals the *carte* of the *Trois Frères Provençaux*, said: "which *carte* I have heard called the *Stewpandect* of Justinian."

A FEW years since there lived in one of the most populous towns of Ohio an old lady with two unmarried daughters, who owned a good property near the centre of the town. One night the old lady departed this life, and next day one of the daughters, being in a neighbor's house, remarked: "I may as well tell you now as any time—mother died last night."

Of course the neighbors made all necessary arrangements for the funeral, and procured a nice carriage for the mourners, who reluctantly consented to enter it, though the cemetery was a mile distant. After the body had been deposited in its last resting-place, and the procession was about to return, one of the bereaved stepped up

to the driver and asked, "*Can't you give us a little ride around town?*" which he politely declined to do.

A few days after the funeral a neighbor was condoling with one of the daughters, and remarked: "You must be very lonely, and miss your mother very much."

To which she replied: "Oh yes! we do—*mother used to eat up all the burned cookies!*"

WE are indebted to a correspondent at Greensboro', Alabama, for the following poetic effusion, addressed by a gallant young rebel to his Dulcinea on the eve of his departure to fields of glory:

1. The time is swiftly rolen on
When parted we must be
My sould in a distan land shal dewel
To you i bid fare well
2. When you are hear and i am there
Shed not a teer for me
I'll pray for you and you for me
That we may meet a gain
3. Off time to church we youst to go
Off time you seen me thair
But a meny day shal pas away
Before we meet a gain
4. Off time at church we sot and sung
A round the fier side
With friend and neighbors dear to us
Those home we dearly love
5. You no you have poses my harte
You no i love you dear
But a meny a day shai pas away
Before we meet a gain
6. Sink down ye senerating hills
Lest sin and death remane
Its love that drives my chariot wheel
And death must yeal to love
7. Now i must lay a side my pen
And to the army i am bound
So hear my harte my loving girl
To you ill bid fare well.

It seems to us that that sixth stanza puts the matter in what might be called the vigorous style.

THE following may be a little old, though we do not remember to have read it for many a year, perhaps not at all. It is of Brummel, who one day was sitting at his club, when a broad, square-framed Englishman came between him and the fire while he was reading the *Times*, and, standing with his back and large proportions turned toward the grate, sneezed twice very loudly. Brummel looked at him over the top of his paper with a very deprecating glance. It had no effect; for presently he gave another very loud blast of sternutation.

"Waitaw!" said Brummel, "we caän't enjure this: bring us an umbrella!"

The "spray" was quite too much for his delicate organization.

A SHORT time previous to the death of the late Governor Marcy he was staying temporarily, with his family, at Congress Hall, Albany. On a raw Sunday afternoon a fire had been kindled in the office for his especial benefit, he being in poor health. A sofa was drawn near the grate, on one end of which sat the ex-Secretary, his massive head sunk upon his chest, and his eyes dreamily fixed upon the coals, in a deep brown study. The other corner was occupied by the writer hereof. Suddenly the quiet of the place was broken by the noisy entrance of three chat-

tering young men dressed in their Sunday best. The foremost of the group, his jaunty cap tipped knowingly on one side of his head, approached the dreaming statesman, and, in a confident tone, said: "How do you do, Mr. Marcy, Sir? You don't recollect me, Sir, I presume. I used to see you at the White House, Sir."

The old Governor, evidently annoyed by this flippant interruption to his meditations, slowly raised his head, and eying the speaker with comic gravity, responded: "Let's see—were you the keeper of the dogs there?"

The young "gent," nothing abashed by this blunt query, replied: "Oh no, Sir—I waited at table, Sir!"

"Humph!" growled the great man, with a sly twinkle in his eye, as his would-be acquaintance tripped gingerly away.

WE were not aware of the important fact (though a military correspondent of the Ninth Cavalry, at Fort Davis, Texas, thinks that occurrence ought to be fresh in the Drawer's recollection) that some years since a party of Indians drove off all the live-stock at Fort Lancaster. A few days afterward Captain ——— was passing through the post, and stopped a couple of days for rest. While there an enthusiastic officer took him out to show him the trail of the bad Indians, how they came, which way they went, etc. After following the trail for some distance the Captain turned to his guide and exclaimed: "Look here; if you want to find any Indians, you can find them; *I haven't lost any*, and am going back to camp."

Curiosity as to the precise route of the aboriginal exodus had on his part ceased to exist.

LITTLE Howard R——, of Alden, Illinois, came into the room where his mother had just hung up a clean curtain, and made the astute observation: "Oh, ma, the window has got on a clean shirt!"

A CORRESPONDENT at West Newton, Massachusetts, says: I am reminded of the following incident by the allusion to language "consistent with the naval character" in the March Drawer. Early on the morning of December 24, 1864, Admiral Porter signaled to the fleet before Fort Fisher, "Get under way and follow me." The ship to which I belonged was assigned, in the programme, to a position between two iron-clads close under the fort. We anticipated hot and terrible work. The flag-ship led the way, and was approaching within range, when Lieutenant-Commander B——, of my ship, ordered all hands called to muster. The brawny tars gathered aft on the quarter-deck, with the officers in their usual places, and our commander commenced to read from the Prayer-Book the "Prayer before Battle." It was a solemn moment; none knew who or how many among us might suddenly be ushered into the presence of the God of Battles. Our commander read as though he felt it; the whole ship's company were awed and hushed, and the throbbing of the engines and wash of water along the side seemed preternaturally loud. When about half through a signal was reported from the flag-ship—"Come to anchor in your positions." When it was read to our commander a sudden revulsion of feeling came over him. Throwing down

the Prayer-Book upon the hatch, he exclaimed: "Well, I'll be d—d if I'm going to pray if we ain't a-going to fight! *Pipe down!*"

Several of that gallant ship's company laid down their lives during the first and second attacks on the fort, and their remains lie under the sands of Federal Point, unmarked but not forgotten.

A PROMINENT member of General Grant's staff, one of those practical, sensible men which the General is noted for having about, is withal somewhat of a wag. He was recently seated at dinner with a gentleman, who, having partaken rather freely, became talkative. The latter, speaking of some one, said, "Oh that mine enemy would write a book!"

"Your enemy," replied the officer, "don't write books."

PERHAPS one of the most "enjoyable" things in a modern court of justice—where not unfrequently innocent witnesses, who are losing patience, time, and money in their compulsory occupancy of the witness-stand (which is a pillory), are "ballyragged" and tormented—is the torturing *in return* of some impudent, unfeeling advocate. A good case in point is this:

In a court not more than about five thousand miles away from the city of Gotham a legal gentleman had gone through the various stages of bar-pleading, and had coaxed, threatened, and bullied witnesses to his heart's content, when it chanced that a very stupid fellow, an hostler, was called upon the stand. He was, in fact, simplicity personified. The counsel, it should be premised, had made a great fuss about the previous witnesses speaking so low that he could not hear them.

"Now, Sir," said the "learned counsel," "I hope we shall have no difficulty in making *you speak up*." (He himself spoke rudely loud.)

"I hope *not*, Sir!" shouted out the witness in such bellowing tones that they fairly shook the building.

"How dare you speak in *that* way, Sir?" demanded the counsel.

"*I can't speak no louder!*"—shouting louder than before, as if to atone for his fault in speaking too low!

"Have you been drinking this morning?" asked the lawyer, who had now entirely lost the command of his temper at the roars of laughter which burst forth from a crowded audience.

"Yes, Sir," said the witness, frankly.

"And what have you been drinking, Sir? Look at the jury—don't look at me, Sir, in that way!"

"*Corfee, Sir.*"

"Did you have any thing in your coffee, Sir?"

"Yes, Sir."

"I thought so," said the counsel, with a glance at the jury. "Well, Sir," continued the "learned counsel," "you say you *had* something in your coffee. State, if you please, to the jury what that 'something' was."

"*Sugar, Sir,*" answered the witness, without the movement of a muscle.

There was another burst of "furtive laughter" throughout the court-room.

"This man is no fool, your Honor" (addressing the Court), "but he is something *worse*."

Now, witness, you must come to the point. Had you any thing *else* in your coffee besides sugar?"

"Yes, Sir."

"Yes?—you *had*?" (Well, we are likely to get at the truth after all, his turning and twisting to the contrary notwithstanding.) Well, Sir, what else *was* it you had in your coffee?"

"*A spune, Sir!*" shouted the witness. "Do I make you *hear* me, Square?—*a spune!*!"

That was the last witness, and the last of *him* on the stand. Here the trial was adjourned until the next day.

VERY forcible and very quaint is the following: "Riches, oftentimes, if nobody *take* them away, make to themselves wings and *fly* away; and truly, many a time the undue *sparing* of them is but letting their wings grow, which makes them *ready* to fly away; and the contributing a part of them to do good only *clips their wings a little*, and makes them stay the longer with their owner."

Now this is exceedingly brief, but it will set many of our wealthy readers to thinking; and who knows (save the All-seeing Eye) that it may not be productive of good to "the poor, and they who have none to help them?"

THE following *Browniana* is so characteristic of the gentleman who undertakes, always with success, the organization and management of those mass meetings that in society are called fashionable parties, and gives so fair a hit at the style of young male person who disporteth himself at those assemblages, that it is worth putting in the "amber" of the Drawer. It is sent by a clever woman, well known in literature:

What an institution Brown is! I am told that he is educating a son to succeed him, when imperative Time demands an account of the original Brown for eternity. I can not believe that any son will ever come up to the mark.

The Brown has spoiled us for all imitations or successors.

There is a humor and a deliberate, sarcastic hauteur in *our* Brown that is inimitable. Two stories about him occur to me, which I must pause and tell.

Jack E——, the artist, having been abroad for a year or two, found himself on his return to New York more bare of invitations (it was in the height of the Carnival) than his aristocratic belongings would justify. Somebody said to him, "Brown *has* invitations for you, but you have neglected to pay your respects to him."

Jack consequently sauntered up to Brown, and, without the air of deference which the Great Sexton expects, said, carelessly, "Haven't you some cards for me, Brown?"

There were some people standing about: Brown put on a greater look of carelessness than Jack's, and said, "What's your name, young man?"

"E——," replied Jack, amused — "John E——."

"Humph!" said Brown; "perhaps I have some;" and then turning round to the spectators, with an affected lowering of his voice which only made it more distinct—

"Society is getting so mixed—I can not follow it."

Another young gentleman fared still worse.

He was well known to be a constant frequenter of that lair of the Tiger, Pat Hearne's. One night, when a crowd of people were leaving some ball, and Brown was shutting carriage-doors, and delivering addresses to coachmen with the correctness of a Directory, this youth undertook to resent what I suppose he considered a work of supererogation on the part of the chief pillar of Grace Church; so when Brown chanted out, not happening to be certain of his lodgings,

"Where to?"

"Where he brought me from," replied the gentleman, with lofty reticence.

Brown slammed the door with emphasis, and in a loud, slow voice said to coachee,

"Take Mr. — to Pat Hearne's."

ONE of our good old patriotic "Friends," in the time of the Revolution (he was from "Rhode Island and Providence Plantations"), is said to have remarked to a gunner who was leveling his cannon against the foe:

"Friend, I am a man of peace; I counsel no bloodshed; but if thee intends to *hit* the little man in the red jacket, thee would do well to point thine engine three inches lower!"

He *did* so, and "took his man."

"There were giants in those days" even among meek Friends.

AMONG the leather-dealers of "the Swamp" there were few who had a keener perception of the ludicrous, or who could relate an anecdote with greater effect than the late C. M. L—. He once stumbled on an odd character on board a steamboat, and daguerretyped him on the spot.

"I had just finished my supper," said he, "and was enjoying my cigar on the deck, when I heard a man declaiming, in a loud voice, to two or three attentive listeners (but evidently intended for 'whoever it might concern' at the same time, on *Pathology*. Being, as it were, thus invited, I also became a listener to something like the following:

"'There it is now! Well, some people talk about *seated* fevers. I don't know any thing about seated fevers; there ain't no sich thing as a seated fever. A 'sketer-bite is a seated fever; cure the bite, and the fever quits you quick enough. Jes' so with a *bile*—the same thing. There ain't no sich thing, I tell ye, as a seated fever. Fact is, and you can't rub it out, your regular doctor *practizes* according to books; now *I* *practize* accordin' to common-sense. Take a case now: There was Dr. Rugg, of our village, the very Samson of the Materier Medicker. Wa'al, he treats fevers according to the books. What's the consequence? I get all the patients! He met me one day, and says he to me, says he, 'How is it that you git all the fever cases?' I told him exactly how it was; and it is so.'

"'Well, doctor,' interrupted one of the listeners, 'how do *you* treat fevers?'

"'Well, there it is, you see! You ask me how *I* treat fevers. If you'd ha' asked me when I first commenced *practizing*, I could ha' told you—can't tell you now. I treat cases *zactly* as I find 'em—according, as said afore, to common-sense. And there it is! Now there was Mrs. Scuttle; she was taken sick. All the folks

said she had the consumption; hadn't the consumption more'n you've got it [singling out a burly listener, who weighed some two hundred and fifty or three hundred]; had two doctors at her at once; didn't do her a single *mossel* o' good. Wa'al, they sent for me; and as I went into the house I see a lot of tanzey and a flock of chickens by the door. Felt her pulse. Says I—and she'll never forget it till her dying day does come—says I, 'You ain't no more got the consumption than I've got it, not a bit.' And there 'twas, you see! In two weeks I cured her.'

"'Well, but, doctor, how did you cure her?'

"'There it is again! I told you I see a lot of tanzey and a flock of chickens growing at the door. I gin her some of the tanzey and a fresh-laid egg—brought her right up! It's kill or cure with me. Fact is, gentlemen,' continued the doctor, 'I call myself an officer. My saddlebags is my soldiers, my disease my inimy; I rush at him, and 'ither he or me has got to conquer! *I* never give in.'

"My cigar was out," says our narrator, "and while engaged in lighting another the 'doctor' vanished, possibly hastened by the influence of one of his own prescriptions."

What this learned "doctor" was, in comparison with the medical profession as a class, the hero of the "Harp of a Thousand Strings" was to the clerical. It seems to us that both are equally "originals in their way," and their portraits will bear "suspension" as "companion-pictures."

CHEERFUL views of the verdicts of juries in cases of the higher crimes are taken by the authorities and people of Nevada. Two "gentlemen" were confined in the county jail at Austin, in that State, one of whom was sentenced to be hung on the 30th ult. Another was on trial for a similar irregularity. The case had been tried, and the jury had come into court to render their verdict. As the accused was leaving the jail for the court-room to hear the result, he asked a friend who was accompanying him what he thought the verdict would be—remarking at the same time, "*I* think it will be manslaughter." "*I* think so too," replied his companion, "and I reckon you'll be the man slaughtered!" Such was the result; or, to use an expression current in Nevada, "That's about where it lit."

A STORY is told of Mr. Harrison Riley, of Lumpkin County, Georgia (perhaps manufactured), in regard to his first session in the Georgia Legislature. He can neither read nor write. Sitting one day in the public room of the old Mill-edgeville Hotel, a strolling Italian came in with the usual petition, stating that he had been wrecked in coming over to this country, and wanted to raise a little money to get back.

He handed his paper to Mr. Riley, who thought that all things there must pertain to the Legislature, and that this seedy-looking fellow wanted him to vote for something. He could not plead ignorance, and so took the paper, and after seeming to read it carefully gave it back, saying, in a loud tone: "My duty to my constituents would never let me vote for that bill, Sir!"

His secret was out, and every body smiled out loud.

The Red Man

and

The White Man.

Lo! the poor Indian!

See! the poor White Man!

He hunts Deer on the Prairie.

He hunts Dears on the Streets!

He lives upon Game.

He lives by Gaming!

He creeps upon the War Trail.

He treads upon the Trail of Peace.

He lifts Hair in a Savage manner.

He lifts Hair in Barberous fashion.

He listens to the roar of the Cataract.

He hearkens to the Notes of the Waterfall.

HARPER'S NEW MONTHLY MAGAZINE.

No. CCXXXI.—AUGUST, 1869.—VOL. XXXIX.

PICTURES OF THE JAPANESE.*

JAPANESE ARTISTS AT WORK.

AT about seven o'clock in the morning of the 9th of May, 1866, we dropped our anchor in the harbor of Yokohama. A magnificent panorama was that we passed as we sailed along the coast that bright and beautiful morning; the land green and tree-covered; hills rising from the water's edge, cultivated in terraces to their summit; every where, except on the most barren mountains, whose ribs defy flesh, a most tropical greenness; junks with their huge unwieldy looking sterns, and great mat-sails hanging idly on their single masts; natives putting their olive faces out of junk windows, or thronging the decks to see our steamship plowing through the water; temples and palaces half hiding among the trees; mossy lawns between the mountain's foot and the sea; mountains, always mountains, of every shape and color; mountains crowding close to the water's edge; mountains far away, hidden by morning cloud or veiled by early mist; mountains that were gardens from their base to their peak; mountains that were wild and barren, standing out in clear white outline; mount-

ains standing solitary like watch-towers in the midst of a garden; mountains reaching in long ranges far as the eye could see; but monarch of them all, the venerable white-headed Fusi-yama, prominent alike by reason of its towering height—12,000 feet—and its peculiar shape and isolated condition.

Yokohama was to be our home for the next two years. It was in appearance all that we could have desired. For a year we had suffered a particularly sickly season in Hong-Kong. The contrast heightened our appreciation of the lovely land in which we found ourselves that bright spring morning. Our eyes, accustomed to rest on the barren-looking hills of Kowloon and Hong-Kong, feasted on every new feature of the beautiful landscape which was spread before us, and the sight of green fields and wooded hills brought to many a heart recollections of happy country homes far away in old England. The contrast between the countries was scarcely greater than that between their respective inhabitants.

Arriving as we did from China, the land of pug-noses and yellow skins, we were at once struck with the fresh ruddy complexions, and in many instances well-cut features, of the Japanese. Besides the difference in their personal appearance, they offer a marked contrast

* The statements in this article are chiefly taken from *Our Life in Japan*, by R. MOUNTENEY JEPHESSEN and EDWARD PENNELL ELMHIRST, Officers of the Ninth Regiment of the British Horse-Guards. The pictures are from photographs or native paintings.

DIGNITARIES AND SUITORS.

to the Chinese in manner and bearing. In place of the cringing abject demeanor of the latter, they carry themselves as becomes men, fearlessly and uprightly, look you straight in the face, and consider themselves inferior to none. The better class are a fine bold set of men. Like knights of old, they are ever ready to avenge a wrong, or even to provoke a quarrel; and with their terrible two-handed swords would be any thing but contemptible antagonists in hand-to-hand fighting. Their manners are polished in the extreme. As a rule they are exceedingly good-natured, and have a keen sense of the ridiculous—rather too much so; for we believe that if the most dutiful son, possessed of the greatest filial piety, were to see his father dying, he could not repress a laugh if

the old gentleman were to do so in at all a comical way.

The Japanese ladies are almost as fair-skinned as their sisters of the West. Small but neatly—nay, sometimes faultlessly—shaped; their flowing robes displaying in its own gracefulness the model that nature has adopted, and which none of the meretricious deceptions of civilization can improve upon; with pretty captivating manners, and a language musical and soft as Italian, the laughter-loving nymphs of the Rising Sun have many and powerful charms. No one who has been in Japan will deny their claim to beauty.

The Japanese are far from being the uncivilized persons we are apt to imagine them. No people in the world are more polished in their

LADY'S-MAID.

manner, not only toward strangers, but toward each other. Even among the lower classes, two friends meeting in the street never approach until after bowing low two or three times in succession, while making that peculiar hissing noise that they use to convey a greeting. Their dress, though, of course, most

BRIDE AND BRIDEMAID.

peculiar, according to our ideas, is both convenient and elegant. The loose trowsers and "chimonos" (an outer garment, like the mantle of the Jews) of the men, and the robes of the women, are made of silken fabric, varying from the gauze for summer wear to the wadded quilt that can withstand the cutting blasts of

MOTHER AND SON.

MERCHANT'S FAMILY

BETTOS, OR GROOMS, IN FULL COSTUME.

winter. The women's dress is confined to their waists by a colored wrapper, also of silk, and long enough to wind in perhaps a dozen folds round their bodies. This "obi" is also worn by the men, but underneath the "chimono." The men shave the crowns of their heads, bringing the remainder of the hair, trimmed and plastered into a thin cord, forward over the bare part of the scalp; while the women tie up their long black locks in the most tasty fashion, with gold, silver, and scarlet cord. The *bettos*, or native grooms—a separate caste—in summer dispense pretty much with all clothing, and supply its place by a tight-fitting flesh sur-

tout of tatooing of the most wonderful pattern. They are capital grooms, and will face and handle the most dangerous horse; but they are terrible thieves. It is wonderful what distances and at what a pace they will run alongside their masters, when they are riding into the country—being always at hand to take charge of the horse when a halt is called, and to throw over him the rug they have carried rolled up on their shoulders.

Extreme cleanliness characterizes all classes. The matting on the floors of the poorest habitations is scrupulously neat. The utensils, mostly made of wood, are scoured and polished perpet-

A KANGO.

ually. We have often, when staying at farm-houses, taken our meals laid out on the floor; and on more than one occasion have purchased the delicate sea-weed soup that is hawked about the streets of the town without any fear of either the materials of the soup itself or the cups which contained it being less clean than at our own table. The palanquins, or "kangos," are but a sorry substitute for our carriages. They consist of a mere seat with a back and cover made of the ever-useful bamboo, and slung on a single pole, each end of which is carried on the shoulder of a coolie. Every two or three hundred yards the bearers stop, place a stick under their respective ends of the pole, and change their

burden to the other shoulder, apparently at the imminent risk of dropping kango and rider into the mud.

The savage barbarity which characterized the punishments of the Middle Ages is still a feature of punishment in Japan. The fiendish ingenuity of the Roman Inquisition is outdone by the diabolical contrivances of the acknowledged jurisdiction of Japan. The bastinado, the application of crushing weights, piled gradually heavier and still heavier on the yielding chest, the severance of member after member and limb after limb from the quivering trunk, followed by beheading, by crucifixion, by impalement on blunt spears, by tearing asunder

by means of wild cattle rendered mad by flaming torches—such are some of the many awful forms of death employed. The more common method of execution, simple beheading, is, however, a speedier and more merciful method than that of the gallows. Such an execution we were invited to witness soon after our arrival in Japan.

When within about half a mile of the prison we met an immense crowd of people, and on inquiry found that the criminal was even then being paraded on horseback through the town, and would pass us on his way to the place of execution. Remaining where we were we soon saw the cortège approaching. First of all came two men bearing placards raised on poles—the one proclaiming the nature of the crime for which the offender was to suffer and the punishment he was condemned to undergo, the other inscribed with his name and native place. Immediately following, guarded by two spearmen, rode the doomed man, tied to his horse, with his arms tightly pinioned behind him, and a rope fastened to his waist. This was held by a man who walked alongside. With a skin blanched, parched, and shriveled, features worn and distorted, eyeballs glazed and sunk, his cheek-bones appearing to be forcing themselves out, and his withered arms hanging nerveless at his side, the wretched being strove hard to bear himself bravely, and to behave at the last as became one of his race. As he passed his eye lit on our party, and he called out, with a scornful laugh, for the foreigners to come and see how a Nippon could die.

Next in order in the procession came some men on foot, and lastly two officers on horseback with their retainers. Following them we soon reached and were admitted into the prison. Built entirely of wood, it consisted of a collection of low, black, one-storied edifices, whose dismal hue and sombre aspect alone must have been enough to crush out hope from the hearts of the unfortunates entering there. In the centre of these was the court-yard or execution-ground, the whole being contained within a high wooden paling. The different cells were all open on one side, and crossed and recrossed by stout wooden bars, through which you could look upon the occupants.

Some of these—probably suffering for lesser crimes—seemed tolerably well cared for; while others, huddled together like sheep in a pen, appeared worn and emaciated—in some instances to a degree horrible to contemplate. They had no protection from the piercing night-air, which could penetrate through the open sides of their cages, and strike into frames almost equally free from clothing and from flesh.

While we had been making our tour of inspection the doomed culprit had been unlashd and dismounted from his horse at the gate. But when set on his feet he was unable to stand, owing to weakness and the constrained and painful position in which he had been kept

so long, and his guard were obliged to carry him into the precincts of the prison. Here an ample breakfast had been provided, of which he ate heartily, and with evident enjoyment. After a full half hour it was intimated to him that his presence was expected. With the assistance of an attendant on each side, he walked slowly into the execution-ground, and was placed, kneeling and sitting on his heels (in the universal Japanese posture), behind a small hole dug out for the reception of his head. Some ten yards in front of him, and separated by a rope running across the square, sat the presiding yakonin and the prison authorities, calmly fanning themselves; and beyond these again were the six or eight foreigners who had been admitted.

The prisoner's arms were then pinioned behind his back; but, before the cloth was tied over his eyes, he requested that a minute's grace might be allowed him. This being granted, he raised a weak, quavering voice to its highest pitch, and screamed out, "My friends!" Immediately an unearthly chorus of wails answered the poor wretch from his friends outside the walls, none of whom could be seen from the interior. This was followed by "Syonara" (good-by), and by a deeper and more prolonged wail from the crowd outside. The prisoner then signaled to his guards that he was ready, and submitted quietly to the operation of blind-folding; the executioner stepped up, and carefully adjusting the victim's head a little on one side, so as to hang exactly over the hole prepared to receive it, signified that all was ready; the word was given, when, without raising his

BEHEADING.

A PICNIC.

weapon more than a foot above the neck of the condemned, the executioner brought down his heavy blade with an audible thud which severed the head instantly from the body.

Immediately the head fell it was seized, carefully washed and cleaned, the procession was re-formed as before—except that the horse previously ridden by the deceased now carried the executioner in charge of the lifeless head—and wended its way to a raised mound at the side of the highway a quarter of a mile distant. Here a kind of gallows had been erected, and on this was placed the dead man's head, supported in its position by clay, there to remain for six days, in sight of all passers-by, and a warning to all evil-doers.

In the garrison every Thursday was devoted to enjoyment and recreation. One of these Thursdays was the occasion of a visit to Dai-boots, the great bronze Buddhist idol of Japan. Our road led through a succession of lovely lanes, with camellias growing luxuriantly on either side. The growth of the camellia-tree in Japan is most wonderful. Some of them attain the height of at least forty feet. For miles we rode under these camellia-trees in full flow-

er. Later in the season, when the camellias have ceased to bloom, their place is supplied by the azalea, which marks the hill-sides with gaudy patches of crimson, and the landscape becomes more gorgeous than ever. With the barley and rice in full ear, nothing but a rich mixture of gold, crimson, and green meets the eye, which turns from this, as from too much of a good thing, with a feeling almost of relief and refreshment, to dwell upon the quiet, thatched homesteads, with their well-swept yards in front, where the children are playing, and the old women are sitting at their spinning-wheels. What an air of perfect peace and contentment reigns around! The rustle of the leaves as they shimmer in the sunlight, the merry shout of some little child at play, the bark of the *fukée* dog as he sniffs the blood of the *tojin*—all is delicious. It was when the scene was at its loveliest, the hedges at their greenest, and the sun at its brightest that we descried coming along in the distance a laughing, merry group of Japanese. When we met them they turned out to be a troop of conjurors and top-spinners, on their way to Yokohama. Here was an opportunity of amusement not to be lost, and on the prom-

SINGING GIRLS.

DOCTOR OF MEDICINE.

ise of a few *ichiboos* (a coin worth about eighteen pence) they declared themselves ready to give us their whole *répertoire*. A shady, grassy spot, with a green bank for seats, and a level sward, was soon found just off the road, and after tying up the ponies we sat ourselves down to watch the performance. This was the first time they had ever acted before foreigners, and we seemed to be a source of infinite amusement to them; for their preparations, as they

MERCHANT, IN WINTER DRESS.

laid out all their paraphernalia on the ground, were gone through amidst much giggling and furtive glances at us. They performed the usual Japanese tricks, consisting of top-spinning in every variety, juggling, the butterfly trick, and many others, all of which we suppose are more or less familiar to our readers now; for troops of Japanese conjurors have visited America and England since then. Indeed, several of the very party who performed

COOLIE, IN FULL DRESS.

FEMALE WINTER DRESS.

JAPANESE TEMPLE.

before us in this shady grove have since made their *début* before American and English audiences. We have seen in crowded assembly-rooms, in gorgeous theatres, in drawing-rooms among friends, wizards of the north, wizards of the south, wizards of every point of the compass, but never have we enjoyed any thing of the sort as much as we did that half-hour with these top-spinners, in that shady, quiet little glade, with its soft grassy bank whereon to recline and smoke the fragrant cheroot, and its clear limpid stream at which to slake our thirst.

About three or four miles from the village of Kanasawa we arrived at Kamakura, where we

stopped, for the purpose of visiting the temples, for which this locality is famed throughout the length and breadth of Japan, and to which pilgrims flock from all parts of the country at certain seasons of the year. The temples, as regards general outline of form, are very similar to all other sacred edifices in Japan; but in size, costly carving, and number, they far surpass any thing of the kind to be seen out there. The entrance to the sacred grounds consists of three arched stone bridges very much in the willow-pattern style over a moat which was covered with lotus plants and water-lilies. Just outside the gateway, forming a second en-

BRONZE IMAGE AT DAIBOOTS.

trance, two sacred ponies are kept perpetually caparisoned in the most grotesque manner. They are never taken out of their stalls nor allowed to lie down, being slung from the roof of the stable. They are thus supposed to be ready at a moment's notice for the god of war in the event of that deity taking it into his head to ride abroad. It is of course only among the most ignorant that this superstition obtains any credence. The old priest himself, as he told us it, grinned from ear to ear, and even the little boys laughed. These ponies were both perfectly white; and one of them had pink eyes, which gave him an Albino-like expres-

sion. On payment of a *tempo* (about two-pence), the traveler may purchase for himself the unspeakable honor of being allowed to present them with two or three little saucers full of corn, which they dispatch with a relish that leads one to believe that they are dependent on this sort of charity for their food.

A brisk trot of about half an hour brought us to Daiboots, one of the most sacred edifices in Japan. This is a huge bronze figure, forty-three feet high, of a Buddhist god, who is represented sitting cross-legged and with clasped hands. The approach to it consists of a splendid avenue of trees, and the figure is seen to

advantage from the end of the vista it affords. Two windows in the small of the back ventilate the interior, which, with its shrines, images, and general decorations, resembles very much a small Roman Catholic chapel. Many a pilgrim has traveled hundreds of miles, foot-sore and weary, to have one look at this huge statue, and to return to his home, in his own opinion a wiser and a better man for having feasted his eyes on what he considers the greatest wonder of the world.

The Tycoon of Japan is not the supreme monarch, but simply the external representative of the Mikado, who is the real head of the Empire; but who, from the seclusion in which he is forced to live—being too sacred an officer for the eyes of his subjects to rest on—is not supposed to act personally in any of the affairs of state. All edicts, though emanating nominally from him, are carried out by the Tycoon, who is at once Prime Minister in civil affairs and Commander-in-Chief of the army. The first official visit to the Tycoon was paid by the English Minister in March, 1867, at Osaka, a town almost equal in size and importance to Yeddo. Our account is derived from a brother officer, who was one of the party.

The Tycoon's castle is built—or rather *was*, for it has since been destroyed by fire—on an elevation commanding the town. It was surrounded by a moat so wide and deep that a ship of 1000 tons burden could lie comfortably in it crosswise. The height, from the surface of the water to the crest of the wall on the town side, was about fifty feet, and to the top of the castle wall about one hundred and twenty-five.

It was most solidly built; the scarp and counter-scarp being faced with huge blocks of stone, fitted into each other as nicely as a Chinese puzzle, no mortar or cement being used. This moat was crossed and divided by causeways, built in the same massive, solid way, leading to the principal gates, which were of great strength and height, made of the hardest known Japanese wood—the Ki-ya-Kee—and studded with iron bolts. These gates were never opened except to admit officials of considerable rank, a small wicket being used as the usual mode of ingress and egress.

Within the castle walls, in the grand square which they inclose, the Tycoon's palace was built, in true Japanese style. Dismounting in this square or court-yard the Minister and his suit were conducted by a court official, who acted as their guide, through a long corridor lined with Japanese soldiers, who presented arms as they passed, and were ushered into a reception-room, which was furnished handsomely, and almost entirely in European style. The screens which divided this apartment from the hall were beautifully painted, each in itself being a work of art. The blinds were made of very thin slips of bamboo, gilded and painted, with silken tassels of different bright colors—red, blue, and green. The courtiers and officials they found here were attired in the full court dress, which consisted of the robes usually worn, but made of more costly material, with capes of stiffly-starched muslin, or some such light fabric, projecting about six inches or more beyond each shoulder like wings. The ha-ka-ma, or trowsers, are made about three feet longer than necessary, and trail on the mats behind the wearer, who is obliged to shuffle along in any thing but a dignified way to avoid the catastrophe of being tripped up. Formerly any one approaching the presence of the Tycoon, or even the apartment of the Mikado, had to do so on his knees. This sometimes entailed a walk, under these trying circumstances, of 30 or 40 feet. To avoid this inconvenience the more modern fashion was introduced of long trowsers, to give the appearance and save the discomforts of the ancient attitude of humility.

After partaking in the reception-room of a lunch of sponge-cake and tea, the party passed through a veranda, the side of which was paneled and painted with gorgeous representations of various birds of resplendent plumage, and entered the audience-chamber. Here, seated in the middle of the room, on a peculiarly shaped chair of very old and valuable lacquer, sat a grave, quiet-looking young man not more than thirty years of age, with a very pleasing expression. This was the Tycoon. The room was divided in the centre, the floor of one half being raised a foot above the other. On the raised portion sat his Highness. The floor was covered with finest mats whitened to a snowy tint with rice-powder. The partition screens were of a gold ground, with birds, trees, and flowers done in the best Japanese style. The

FEMALE HAIR-DRESSER.

wood-work was magnificently carved. The Tycoon himself was splendidly and becomingly dressed, with perhaps the exception of the state cap, which was of a peculiar shape made of paper. It rested on the very summit of his head, and was kept in its position by strings which fastened under his chin. His outer robe was of rich white silk, ornamented with medallions in mauve color. His stockings were of the same material. Behind him stood his sword-bearer holding his long sword, Japanese etiquette forbidding any one, no matter how high his rank, to wear his long sword in the presence of a guest. In the rear knelt several attendants. Short addresses were interchanged

between the Minister and the Tycoon, and the various members of the party were introduced to his Highness. He then retired, but shortly reappeared in another dress, consisting of a black silk jacket, or *hào*, trousers of dark blue silk with a gold pattern running through, and a rich *obè*, or belt, in which a handsome short sword was thrust. Strange to relate, hardly a year had elapsed when all this state and position were upset by a revolution, in which the Tycoon was deposed, forced into retirement, his estates partly confiscated, and the splendid castle at Osaka, with its beautiful carvings and paintings, its massive walls and handsome palace, burned and razed to the ground.

THE TYCOON, IN COURT DRESS.

JAPANESE WRESTLER.

Wrestling is a very popular amusement all over Japan, and is practiced universally throughout the country. Wherever a village can boast of a temple a portion of its grounds is devoted to the promotion of single-stick and of wrestling. Traveling professionals exhibit their prowess in matches which afford a very popular amusement to the natives. It was our good fortune to witness one of these performances in Yokohama. An ichiboo apiece admitted us to the amphi-

AN ICHIBOO.

theatre, which was built of bamboo, and just sufficiently covered to keep out the sun and rain. Within, it was constructed very much like a circus; consisting of an inner circle kept clear for the performers, and around it rows of seats rising in tiers one above the other. When we entered two burly fellows had just stepped into the arena, and were walking around stretching their arms and legs, and showing their muscle to an applauding crowd, who shouted as loudly for their respective favorites as the backers in an Anglo-Saxon horse-race. They were tall and enormously fat, weight being accounted a greater desideratum in a Japanese wrestling

match than muscle, inasmuch as being pushed out of the ring counts as a fall. Their dress consisted of a cloth twisted around the waist. After strutting about to their satisfaction, each took a pinch of salt from a cup handed to him by an attendant, received a final sponging, and proceeded to challenge by placing a hand on each thigh just above the knee, then stooping slightly, lifting each leg in turn, at the same time raising the hand and replacing it with a loud smack as the foot came sharply to the ground. In this way they went on slowly and deliberately in front of each other for about a minute. Then keeping their hands still on their thighs, they squatted on their heels face to face and about a foot apart. The match was evidently one which excited much more interest than common. The two wrestlers were the champions of their respective districts; and, as both were strongly represented among the spectators, the house seemed to divide itself into two parties, and the betting was spirited in the extreme. It was not till after two or three false starts that the men buckled to in earnest, giving forth short, quick shouts as they struggled for a grip. The chief aim of each, in addition to obtaining and preventing a hold, was to push the other beyond the confines of the circle, and they shoved and butted at each other for some time before getting together. At last they were locked in a close grasp; and as they swayed backward and forward, round and round, the party spirit became uproarious, and the pit shouted lustily to their champions.

For a time it looked as if the bigger man would force the other down by sheer weight and strength; and at one moment he all but got him in his power, when, with a quick effort, the latter released himself, threw his weight in with a sudden push, and his adversary's foot went beyond the ring—an unexpected turn in the tide of battle which was received with the most enthusiastic applause from his party. The second bout resulted in the larger man fairly throwing his late conqueror, amidst the encouraging cheers of his friends. The third, being the deciding fall, the wrestlers took longer than before in their preparation, and it was not until the second call to time by the umpire that they took their places in the arena. The excitement was now tremendous. The blood of the wrestlers was thoroughly up. They closed at once without shouting, for neither could afford to lose any breath. Twisting and writhing, they struggled from side to side—first one obtaining a momentary advantage, then the other. Now the taller one all but succeeded in repeating the throw of the previous round; now, in his turn, he was all but tripped off his legs; and now, without relaxing their grasp, the two stood motionless for some seconds. The heavy weight, though, was too fat to last, and finally his wirier antagonist, getting a good under-grip, doubled him over his leg, and the giant staggered and fell, the other on the top of him.

At this juncture it seemed as if one-half of

the assembled multitude had gone mad. Yelling, dancing, and singing, they testified their joy in the wildest conceivable way. Scores of coats, *obis*, and shoes were cast in to the conqueror—one man actually stripping himself to his waistcloth to swell the list of gifts. The victorious hero himself seemed intoxicated with his success, strutted about the ring, “challenging” fiercely an imaginary adversary, slapping his thighs, arms, and breasts, and behaving altogether like a barn-door warrior when he returns triumphant from the fray.

Among the most popular amusements of Japan is kite-flying. At certain seasons it becomes a passion. Among the lower classes every man and boy provides himself with a kite. No little vagabond is too poor to buy one. They are of all sizes and shapes, from a little one six inches square up to one almost as big as a house. We have seen the sky almost obscured by the number of kites soaring above—in the shape of eagles, swans, warriors, and dragons; while the air has been filled with a humming sound made by them. Sometimes may be seen, in a crowded street, nearly every fifth or sixth person flying a kite, and yet never getting the strings entangled.

Another amusement resorted to later in the season is battle-door and shuttle-cock. It is patronized chiefly by the young girls. It is played with a diminutive shuttle-cock—a small piece of wood not much bigger than a pea, with one single feather stuck in it—and a flat piece of wood, about a foot and a half long, for a battle-door. The players stand in a circle, and after the shuttle-cock has been once started any one trying to hit it, and missing it, receives a smart slap from all the players with their wooden battle-doors.

Of theatricals the Japanese are passionately fond. A piece generally lasts throughout the day. A regular Japanese play-goer will sit it out the whole time, having his meals brought to him. The stage is divided into compartments by partitions radiating from the centre. On the completion of one scene the stage revolves on a central pivot, disclosing the next compartment prepared for the ensuing scene. The Japanese are really great actors. They excel in imitating the various passions. Their gestures and pantomimic action are so expressive that it is not difficult for a foreigner to follow the plot, which is always very simple. Indeed it seems sometimes to be *impromptu*, and to be changed at the will of the audience. We witnessed such a play at a large theatre in Osaka. A woman (this was the plot) had proved unfaithful to her husband, and had been sentenced to execution. Her pleadings were disregarded by the stern judge, and she was delivered over to the hands of the executioner, who stood glaring fiercely, and feeling the edge of his keen sword, which ghastly preparation she stood looking at with a terror-stricken gaze. A subordinate, now advancing, tied a rope round her waist and dragged her to the centre

KITE-FLYING.

of the stage. Here she was forced into a kneeling position, and the executioner advanced with uplifted sword, making extravagantly frightful faces. The woman, as if unable longer to bear her agonizing terror, jumped up, rushed frantically to the foot-lights, and wildly entreated the intercession of the audience. So wonderfully well, and with such effect, was this acted, that the whole house rose, and with yells and shrieks demanded her immediate release. The judge remained firm for some time, as if determined to let the play go on in its proper course; but the audience lashed themselves into such a state of fury that he at last signaled that she was forgiven. This was received with

tumultuous applause, and the rope round her waist was untied amidst the wildest demonstrations of delight, which she acknowledged with bows and fascinating smiles. We did not remain long enough to learn whether the heroine, profiting by the narrow escape she had had, turned over a new leaf and led a better life; for we were warned by some of the Japanese officers in our box that we had better retire, as they said that the crowd, after this extraordinary scene, was almost intoxicated with excitement, and that any slight incident might make us the objects of its fury.

Every powerful Daimio possesses a strong stone castle, so guarded by moats and para-

pets that only a regular siege could subdue it. Excepting these castles, however, the Japanese houses vary very little, from the prince's palace to the peasant's cottage. They are all equally and scrupulously clean. There are few or no signs of ornament in any of them; a handsome screen or two, and perhaps some carved panels, being the only attempts at decoration. The edifices themselves are the most flimsy affairs possible, being made in great part of paper. In erecting a house the skeleton of the roof is always put together on the ground as the first step; each beam is fitted and dove-tailed into the other; and when the whole frame-work is finished it is raised bodily and placed on its supports. Two of the sides are then boarded in, and the other two are closed by means of sliding-screens of paper. Those answering for windows are made of paper thin and transparent enough to admit the light. The floors are raised about a foot from the ground and covered with fine matting, which is always clean in the extreme. So particular are they in this respect that you have to take off your shoes before stepping on it. As may be imagined, such buildings scarcely answer the purpose of keeping out the cold; and in winter the family, swaddled up in quilts, crowd closely round the big "shibatchi"—a wooden box containing an earthen-ware charcoal-burner—which is placed in the middle of the room.

The Japanese put paper to many other curious uses besides making window-panes. It is a much more woolly and less tearable fabric than any made in England. Their pocket-handkerchiefs are of paper, and so are their tobacco pouches—the material prepared to look exactly like leather. In its oiled state they make of it, besides the windows we have referred to, umbrellas and water-proof coats!

If the houses are slight and ordinary-looking affairs, the gardens which environ the summer residences of the better classes are incomparably finer than any which our boasted civilization has produced. They are such gardens as you read of in the "Arabian Nights." It was our privilege to spend many hours in wandering through the summer grounds of Prince Satsuma. They are two or three miles in extent, a perfect labyrinth of taste and beauty. An almost perpendicular hill, along the base of which they lie, affords a strikingly beautiful back-ground, with its thick bright mantle of dwarf trees and flowering shrubs, through which many a silvery stream glances out at times, till it finally leaps forth in a sparkling jet to the gold-fish in the pools below, and thence is led, in a number of miniature torrents and cascades, to form its share of a scene that might give the roughest nature an excuse for a feeling of poetry.

We had the honor to be invited on one occasion to a dinner-party by this same Prince Satsuma. The dining-saloon was a large apartment, the walls of which were, as usual, made of paper, and tastefully painted. There was no furniture of any description in the room, which

was brilliantly lighted with paper lanterns; but carpets were spread on which to sit *à la Turk*, and the rest of the floor was covered with fine matting. Dinner was announced at half past twelve, and did not close till five. It consisted of forty courses, brought on in succession, each being served to every guest at the same moment by a pretty little maiden who was assigned to him for the evening. The cups and platters were of lacquer, and the stands and trays were of the same work. We preserved a copy of our bill of fare for the benefit of housekeepers curious in such matters.

BILL OF FARE.

DINNER GIVEN BY PRINCE SATSUMA, KAGOSIMA,
JULY 28, 1866.

1. Bitter Green Tea (whipped).—2. Sweetmeats.—(*Band arrives, and tobacco is brought on to fill up time between the courses.*)—3. Fish, Soup, and Raw Fish, with hot Saki (a spirit, not unlike whisky, extracted from rice).—4. Soup of Mushroom, Green Vegetable, and Fish.—(*Exit Band, to the great relief of guests.*)—5. Dish of Prawns and Sea-weed.—6. Soup of Sea-weed, Vegetables, etc.—7. Hard-boiled Eggs and Sliced Pears.—8. Soup of Lobster and Mushrooms, with very diminutive Lobsters.—9. Cold Fried Lampreys.—10. Soup of Loochoo Pork Fat, and various Vegetables.—11. Fish, with Salted Plums and Vegetables.—12. Soup of Wild-Boar and Young Bamboo.—13. Cold Fowl and Pickled Shoots of Bamboo.—14. Soup of Fish and Sea-weed.—15. Cake of Fish, Eggs, and Rice, with Green Beans and Fungus.—16. Soup of White Berries, and Sprats.—17. Small Fried Trout.—18. Soup with Acorns, etc.—19. Raw Cattle-fish.—20. Soup of Fowl and Fruit.—21. Green Ginger, Fish in Batter, Cucumber, and Bamboo.—22. *Bêche du Mer* in Batter.—23. Small Bones of Chicken, and *Unlaid Eggs*.—24. Soup of Fish and Roe, with Ginger Leaves.—25. Soup of Cockles (with their shells).—26. Raw Benita, Rice, Apple and Chili Leaves.—27. Soup of Vermicelli, with "Soy" and Red Berries.—28. Sweetmeats.—29. Sea-weed Jelly, Preserved Beans, Bonbons.—30. A Tray with Rice, Thick Soup, and Pickles.—31. Another Tray containing "Daimio Fish" and various Soupcons.—32. A third Tray with Fish "Conglomerate; followed by Saki."—33. Hot Water in the Rice Bowl (as an appetizer).—34. Gelatine Sweetmeat (like stewed India rubber), a Chestnut, and Pickled Tripe.—35. Bitter Green Tea.—36. Large dish of Elaborate Sweetmeats.—37. Bitter Green Tea again.—38. Imitation Peaches, made of Sugar and Sweet Jelly.—39. Red Berry Sirup, Slices of Turnip, Salt, etc.—40. Dried Fish (very small), with thick Soup and hot, strong Saki.

The houses in town and city, as well as those in the country, are made of little else but thin, dry wood and paper. The consequence is that fires are of frequent occurrence, and as destructive as they are frequent. The people profit nothing by experience. They sit in these frail and highly combustible tenements round their charcoal fire, which is placed, with the dryest of matting all round it, in the centre of the room, and as occasion demands pass red-hot cinders to each other, to light their pipes with, in the most careless manner. Their lanterns, too, are of the most dangerous description, made of oiled paper and bamboo cane. When the candle burns down to the socket, unless some one is near to extinguish it, a blaze is the invariable result; and as they are generally hung up against the paper partition of the

PRINCE SATSUMA, THE PRIME MINISTER, AND ADMIRAL KING.

room, every opportunity is given to the devouring element.

Every well-to-do merchant or tradesman has on his premises a fire-proof "godown," or store, which is built of clay, with a coating of white cement smoothed and polished until it looks like marble, and in which are stored his most valuable articles. Besides these private godowns, there are also public ones, of which there are two or three in every street, where the poorer tradesmen and small shop-keepers can deposit their goods on some small periodical payment.

The way in which the Japanese run up new

houses on the sites of the old ones which have been burned down is astounding. In a few hours after the fire has passed a whole street will be nearly rebuilt. At the great fire in Yokohama in November, 1866, nearly an entire street had been rebuilt in this manner, when, the wind suddenly shifting, the fire retraced its course and utterly consumed the newly built dwellings.

We will suppose you to be one of the first on the scene at a fire in the Japanese quarter of Yokohama. It is a novel and exciting scene. The fire has broken out in some house, and the inmates are seen madly endeavoring to save a few articles; but the fire is too quick for them:

what was only a spark a few minutes ago is now a raging flame, bursting forth from every window. The whole street is soon alarmed, and out of every house the inhabitants pour forth, staggering under as much of their household goods as they can carry; and to increase the confusion and din, each one is screaming at the top of his or her voice, while the bells are ringing their loudest call for the fire-brigade.

Hark! here it comes. That regular shout you hear rising and falling in the distance is made by them in time to their steps. More and more distinct you hear it. They enter the street you are in. A ringing noise mingles with their shouts. The crowd opens and surges to let them pass. At their head are two or three men striking on the ground as they run with long iron staves which they carry in their hands. These are the night police clearing the way for the firemen. On come the fire-brigade at a good swinging trot, keeping regular time to their shouting chorus, the officers' silver helmets gleaming in the glare, and the white fire-standards, used as signals to rally the firemen where the fire is hottest, looking weird and ghostly as they sway and wave backward and forward far above the heads of the approaching body of men. Arrived opposite that part of the fire where they mean to commence operations they halt. After a few directions from the principal officer, the small fire-engines, looking like little boxes, are unslung from the men's shoulders and at once set to work; the bamboo ladders are placed against the houses, the tops of which are in a few moments covered with firemen, each one doing his own work thoroughly, while the officers direct from below, or from some exalted and very often perilous positions. Compared with our fire-engines, the wooden Japanese contrivances, like small square boxes, and worked by one or two men, are rather feeble; but they do some good from their numbers, and also from being so small and handy that they can be got into position on the tops of houses, or at any point where they can be of the slightest service.

Inch by inch the fire is combated with; no point being abandoned until it is absolutely impossible to hold it any longer.

That man standing with one of the white fire-standards in his hand on the roof of a house, far in advance of every one else, close to the flames, which leap and dart fiercely at him, is the person who will give the signal to retire to the next point. Until he gives it no one will budge. A cry from the crowd draws your attention to him. You look up. He is on fire. But he has not retreated a step. A slight motion of his hand to the firemen below is the only movement he makes. Instantly three or four engines are playing on him, and his burning clothes are extinguished. More and more angrily the flames beset him. In a few minutes he is on fire again. This time the firemen below are much longer in subduing the flames. At last they succeed; but the fasten-

ing of his vizor has been burned away, and it drops down uselessly on his breast. The crowd cry out, and urge him to retire; but he motions them to be quiet. He is a little pale; but he looks determined. His time for retiring has not yet arrived, he thinks; and until the last chance is gone he will stay at his post of honor.

Sometimes it happens that there is a crash, a smothered cry; the volume of smoke, which rolls up as the roof falls in, envelops the intrepid standard-bearer as in a black pall; and nothing more is seen or heard of him until the fire has passed over the spot which has been his tomb, and he is dragged out a charred and blackened corpse. It is not often, though, that he meets this tragic end; for his experience generally teaches him the exact moment when to retreat, and he makes his escape a few seconds before the rafters give way, to take up his position at another point a little more remote from the flames, probably the next house to the one he has just left, and the same thing is again gone through. Thus, as we have said, the cruel element is battled with, almost inch by inch. There has always been to us a strong spice of the romantic investing this solitary figure, standing thus immovable on the summit of a roof, with its outline defined sharply against the lurid sky or back-ground of vivid flame.

After all there is much that is brave, noble, true about these Japanese, whom we despise only because we do not know them. They are a nation of heroes. Their civilization is real though peculiar. There are many lessons which we might profitably learn from them. And as increasing commerce brings them nearer to us and we know them better we shall respect them more.

THE NEW THEORY OF HEAT.

A GREAT change has taken place within a few years in the ideas entertained in the scientific world in respect to the nature of heat—a change which has led, and is still leading, to the most important practical results. It entirely alters all the reasonings and calculations, and greatly modifies the action, of men, in the management of those vast mechanical operations which constitute so important a part of the movement of civilization at the present day.

The nature of this change we propose to explain; but let not the reader imagine that by receiving the explanation he will arrive at a complete and satisfactory understanding of the subject. It seems to be a law of human progress that every advance which enables us to understand any one mystery brings into view several others more inexplicable than the first; just as every improvement in the telescope, which enables the astronomer to resolve a hundred nebulae, brings into view a thousand new ones beyond which he can not resolve.

Indeed, from the small and narrowly circumscribed field which comes within the reach

of human cognizance, we find infinity extending, as it were, in a great many different directions. It reaches back into the past in *duration*. We can see no evidence that there ever was a time when phenomena of existence had not previously taken place, under the action of the Supreme Cause. It extends forward into the future. We see no reason whatever for believing that these phenomena will ever cease. It extends in every direction around us in *space*. The farther the telescope penetrates into the regions occupied by the countless millions of suns and stars, the higher becomes the probability that the regions thus filled never come to an end. It extends inwardly, as it were, in the direction of *minuteness*. The microscopists fail as completely of finding any indications of an end to the boundless divisibility of material substances, or any lower limit to the minuteness of the organizations developed by animal and vegetable life, as do the astronomers in reaching the outer confines of space, and discovering the remotest possible nebula or star. It extends, moreover, in the direction of *intricacy and complicateness of composition and structure*. The study of nature leads us in some few exceptional instances from the more complicated to the more simple; but in almost all cases the progress is entirely the other way. Apparently single results are found to be the effects of a vast number of combined and co-operating causes, and substances, seemingly most simple and homogeneous, are found to consist of the most complicated combination of elements and properties, each of which, on a further analysis, proves to have involved in it as intricate a maze as the apparently simple element with which the investigation was begun. What, for example, can be apparently more simple, homogeneous, and indivisible than *light*, as it strikes the senses of the uninstructed observer; but what can be more infinitely complicated than the results already attained by the very partial and incomplete analysis to which experimental philosophers have subjected it—with its multitudes of colors so homogeneously blended—its millions of spectral bands—the endless number and variety of its undulations, differing each from the other in length of wave, and in rapidity of succession and of transition through space—its polarizations—its electric and magnetic properties and relations—and the countless diversities of quality, depending on the nature and character of the radiant surface from which it comes?

We find an experience analogous with this in every case where we attempt investigations in the material world around us. The advance we make in the solution of one mystery brings glimpses to our view of twenty others beyond it more inexplicable than the first. Let no one expect, then, ever to *satisfy* his desire to know, by any progress that he can hope to make in learning. The way to be satisfied with ourselves in respect to our knowledge is carefully to abstain from all attempts to know more.

The most ignorant are the most unconscious how ignorant they are.

The first step to be taken in the consideration of the subject in question is to distinguish between the *sensation* of heat, which we experience in our bodies, and that physical entity, in the external world, whatever its nature may be, which is the cause of the sensation. The sensation of heat is an effect simply upon the nerves of the human sensorium. The sensation of cold is another effect produced by a different mode of action of the same cause. The external and material cause of these sensations must not be confounded with the sensations themselves. They are entirely distinct phenomena—the difference between them being somewhat analogous to the difference between the pain of a prick and the form of the point of the instrument which produces it.

This distinction illustrates the old saying, which has so often been regarded as a pedantic paradox, but which is, nevertheless, in the sense intended, strictly true—that there is no heat in fire. The meaning is, that there is no *sensation* of heat in fire—which must, of course, be true, since there can not be any sensation of any kind in fire. It must be kept in mind, therefore, that in the present discussion the subject of investigation is not a sensation of any kind in us, but that element or power in nature which produces the effects which we attribute to what we call the action of heat—the sensations above referred to, both of heat and of cold, being included among them. The sensations are only some of the effects. What we wish to investigate is the nature of the cause.

The change which has recently taken place in scientific opinion on this subject is substantially this—that whereas heat was formerly regarded as a substance, it is now regarded as a *force or power*.

And inasmuch as we seem to be able to form no other conception of force than that of *motion communicated*, heat is now believed to be, not as it has been heretofore considered, a specific substance, producing its effects by insinuating itself among the particles of other bodies—but as a simple force or motion taking place among those particles themselves.

It was, of course, long since known that, in some way or other, heat was capable of developing force and producing motion. Bodies were found, when raised in temperature, to *expand* with great force. In certain cases, as when the application of heat had the effect of changing a substance from a liquid to a gaseous form, the amount of force brought into action was extremely great, though the amount of heat required to produce the effect was great in proportion.

A very curious instrument, made for the purpose of showing, experimentally, a method by which mechanical force could be produced through the action of heat, has been in use among philosophers from a period so remote that the origin of it is lost in antiquity. It con-

THE EOLIPILE.

sists, as made at the present day, of a strong metallic ball mounted upon wheels, as seen in the engraving, and with an alcohol lamp or other heating apparatus below.

At the rear of the ball is a tube opening into the interior of it. When the instrument is to be used a quantity of water is poured into the ball through the tube, the orifice is stopped with a cork, and the lamp below is lighted. The water soon boils—that is to say, the heat passing through the metal forming the ball exerts its expansive force upon the water—as it used formerly to be said, or as is now said, *becomes transformed* into expansive force—until at length, under the action of this force, the water becomes changed from a liquid to a gaseous form, the force all the time increasing, till finally it expels the cork with a loud report, and then the ball itself is impelled rapidly forward along the table, or over the floor, by the reaction of the steam—that is, its *push*—against the air without. The air is, of course, driven one way by this action, and the Eolipile the other.

Another mode of explaining the action of the Eolipile—or, rather, another mode of stating the same explanation—is this. When the water begins to be converted into steam, the great expansive force developed by the heat acts in every direction *within the ball*. But as this force is the *same* in every direction, and, so long as the cork remains in its place, is every where effectually resisted, no motion of the ball results. But so soon as the pressure becomes sufficiently great to drive out the cork the pressure is relieved in that direction, while it continues in full force in the other; and this, of course, causes the ball to move forward on its little truck.

The steam, in issuing from the tube in the rear of the ball, drives off the air from behind it so as to create a strong current of wind. It is from this circumstance that the instrument derives its name—Eolipile—which means *the ball of Eolus*. Eolus was the ancient god of the winds.

The principle of the Eolipile is sometimes employed in producing other effects besides driving the little carriage which supports it. When the orifice is small, and the heat beneath is raised sufficiently to produce a rapid ebullition, and a consequently high pressure of steam, the jet issues from the orifice with so much violence and noise as to give a very vivid idea to the observer of the intensity of the expansive force which the heat has developed in the steam.

Indeed, without proper precautions the experiment is not unattended with danger. For if the opening should by any accident become closed—as, for instance, by the accidental presence of some foreign substance in the water—or if it is not large enough in relation to the thickness of the shell of the ball and the rapidity of the ebullition—then the ex-

pansive force within may increase until the strength of the metal gives way, and the ball bursts with a frightful explosion.

The principle of the Eolipile is employed in the construction of a certain form of blow-pipe. In this case, instead of water, a liquid furnishing a vapor that is inflammable is put into the ball. This vapor, as it issues from the jet, is set on fire, and the flame is used like the flame of any other blow-pipe.

The fact of there being an intimate relation between heat and force, by which the one may be made the means of developing the other, has thus long been familiar to mankind. What is new in the present theory is, that heat *is* force—force existing in a peculiar form; and as the only conception we can have of force is that of a tendency to persistence in motion, what was formerly considered as the development of mechanical force from heat is now regarded as the simple change of one mode of motion into another.

The former theory was, that the phenomena of heat were produced by the agency of an extremely attenuated and subtle substance which was poured out in all directions from the sun, and from all other heat-radiating surfaces. This substance was called *caloric*. The particles of caloric were supposed to be mutually repellent in their action upon each other; and they were, moreover, imagined to exercise a repulsive force upon the particles of any substance into which they were introduced. This force was, of course, antagonistic to the force of cohesion, and thus tended to *expand* the substance affected by it, and, if the quantity was sufficiently increased, to change its structure essentially by converting it from a solid to a liquid, or from a liquid to a gaseous form.

As, however, it was found that the nicest balances could detect no difference in the weight of a body when subjected to the greatest extremes of heat and cold, it was inferred that caloric must be a substance not subject to the law of gravitation, or, at any rate, that if it were actually under that law, its tenuity was so extreme that its gravity was wholly inappreciable to human observation. There were several other substances which were supposed to be analogous in their constitution and character to this imaginary caloric, namely, substances producing respectively the phenomena of light, electricity, and magnetism—although neither of the four, except caloric, received a distinctive name.

The four, however, as they seemed to resemble each other somewhat in their supposed constitution and mode of action, were arranged in a class by themselves in the treatises on chemistry and philosophy existing half a century ago, under the head of *imponderable substances*. This classification now, however, as well as the word *caloric*, and all idea of the existence of any species of matter not subject to the law of gravitation, have been abandoned together. The phenomena of light, heat, electricity, magnetism, and actinism—which is a chemical agency radiated in connection with light and heat from the sun—are now universally regarded as different forms of force; in other words, different modes of persistent motion taking place among the elementary constituents of matter.

The error of the old hypothesis, and the probable truth of the new, was indicated, in the first instance, by experiments going to show that an indefinite, and apparently an unlimited, quantity of heat might be educed from any solid body by means of friction, provided only that the mechanical force was supplied for continuing the friction. This, it is evident, was quite inconsistent with the idea that the heat consisted of a definite, and of course limited, quantity of a *material substance* contained in the body experimented upon; but agreed perfectly well with the supposition that its true source was the mechanical force employed in maintaining the friction, and that, in its nature, it was nothing else than that force itself transmuted by the effect of friction into a new and different form.

These experiments have been repeated in new forms and by means of improved appliances, until at length it is not only established that there is a close and constant relation between the *amount of mechanical force* expended and the *quantity of heat* developed, but the equivalent of one for the other has been very precisely ascertained. The investigation has been made independently, by many different experimenters, and in many different ways; and the results agree so nearly as to produce an unanimous conviction throughout the scientific world that the conclusion arrived at is substantially correct.

We will explain the principle of one of these methods, which will give the reader a general idea of the nature and character of the work that was to be done, and of the mode of doing

it. It is obvious that the inquiry might take either of two forms. We might attempt, first, to ascertain what quantity of heat would be developed by the expenditure of a given amount of mechanical force; or, secondly, what amount of mechanical force could be produced by the expenditure of a given quantity of heat. The illustration which we shall give presents the inquiry in the latter form.

The engraving represents a machine driven by the alternate heating and cooling of air. The thing to be done is to set the machine at work in producing a kind of mechanical effect which can be precisely measured, and then to ascertain exactly the quantity of heat that is expended in producing this effect, with a view to determining the equivalent of one for the other.

The large wheel on the right is simply a fly-wheel, so called—its function being to give continuity and steadiness to the motion. The small wheel, outside of it, works the pump seen below, which is employed for supplying a constant stream of cold water, for a purpose which will presently be explained. The small stand seen in the centre of the frame-work below rep-

HOT-AIR MACHINE.

resents the mode of supplying fuel, whether gas or coal, for furnishing the necessary heat, and the pipe seen at the left-hand corner behind is the chimney employed for carrying away the products of combustion.

All these parts are subsidiary. The essential elements of the apparatus are the two short cylinders, one in the centre, resting upon the main portion of the frame, and the other at the left, supported by a projecting shelf.

SECTION OF THE MACHINE.

The adjoining engraving shows the interior structure and arrangements of these cylinders. The smaller one—the one at the left—is substantially like the cylinder of an ordinary steam-engine—that is, it has a piston within exactly fitting the cylinder, and capable of an ascending and descending motion according as the pressure upon it from above downward or from below upward predominates. The upper surface of the piston is open to the air, so that it is at all times subject to the ordinary atmospheric pressure. The under surface has hot air and cold air alternately introduced beneath it—in a manner presently to be explained—so as to make the pressure from below upward alternately greater and less than the atmospheric pressure above, and thus to cause the piston to rise and fall.

The larger cylinder contains also a kind of piston which is made very thick and is formed of some good non-conductor of heat. The upper and under surfaces of this piston are made concave to fit the lower and upper surfaces of the cylinder. The under surface is exposed to the flame from the fire. The upper portion is surrounded by a space which is kept constantly filled with cold water, by means of the pump already referred to.

It is unnecessary to explain minutely the working mechanism of the machine. It is sufficient to say that the two cylinders are so connected by pipes, and the two pistons by the cranks seen above, that the hot air produced under the great piston by the fire passes beneath the piston in the small cylinder and forces it up. By its motion upward the piston

in the large cylinder is brought down, the communications between the two being opened and closed in such a manner as to continue the reciprocating action, by which a succession of impulses are given to the fly-wheel. The amount of work accomplished by the machine is easily ascertained by means of a cord wound around a prolongation of the axle, to the end of which a weight is suspended. The height to which the weight is raised in a given time is evidently a measure of the force exerted by it.

It would seem to be a much more difficult thing to measure with precision the amount of heat required for working the machine for any given period; still more to determine whether any portion, and if so, what portion, of this heat was actually transformed into mechanical force in such a manner as to disappear, or, in other words, to cease to exist *as heat*. The object was finally accomplished in the following ingenious manner:

First, the whole machine was inclosed in a double casing, the space included being filled with broken ice. Proper precautions were taken to prevent the admission of air of a temperature to affect the result, and the products of combustion were conveyed in pipes through the ice, so as to cool them completely before passing them into the chimney. Other precautions, which can not be here particularly described, were taken to guard against influences from without which might affect the result. A given weight of a particular kind of fuel was then burned in the engine thus inclosed—the engine being in this first experiment disconnected from the weight, so that it should have no work to do except to overcome its own friction. Of course all the heat resulting from the combustion—or very nearly all—would be expended in melting the ice surrounding the apparatus. The exact quantity of heat resulting from the combustion of that quantity and kind of fuel, measured by the quantity of ice which it was capable of melting, was thus ascertained.

The next step was to repeat the process under precisely the same conditions, except to give the machine some work to do, in the way of *lifting*, by attaching a heavy body of known weight to the cord wound around the axle. The same quantity of fuel was then burned under the same circumstances in every respect, except that now the machine was loaded and had work to do. When the combustion was completed the amount of the melting effect which it had produced upon the ice was determined by measuring the water resulting from the process. The melting effect was found to be decidedly less in this second instance than in the first, showing that when work is accomplished the heat *disappears*, or ceases to exist as heat, and becomes transformed into mechanical motion.

This experiment and others analogous to it have been made so many times, and by so many different and independent observers, as to es-

tablish the fact beyond all possible question that heat and mechanical force are convertible into each other according to a certain fixed and unvarying ratio. The expression of this ratio is called the Mechanical Equivalent of Heat.

A distinguished mechanician named Joule, of Manchester, England, was one of the most prominent of the English experimenters on this subject, and the result which he obtained is universally accepted as the correct expression of the ratio in question, in terms of English measurement. He adopted as the unit of measurement of heat that quantity required to raise one pound of water one degree of Fahrenheit's thermometer, and the unit of force that amount necessary to raise one pound in weight one foot high, at the surface of the earth. Now he proved by his experiment—

That the quantity of heat required to raise one pound of water one degree, Fahrenheit, was equivalent, if converted into mechanical force, to raise one pound in weight *seven hundred and seventy-two feet* into the air. And, conversely;

That a weight of one pound, falling seven hundred and seventy-two feet, and striking a solid obstacle at the foot of its descent, would develop, by the concussion, a quantity of heat sufficient to raise the temperature of a pound of water one degree. Or, to express the principle briefly, 1 unit of heat is equivalent to 772 foot-pounds.

This is known as Joule's Equivalent—the term foot-pounds meaning the force required to raise one pound one foot.

The equivalent is, of course, in fact, the same in France as in England; but the expression is different, being there accommodated to the French measurements and nomenclature. There the *centigrade* thermometer is used, each degree of which is of nearly twice the value of those of Fahrenheit. The French standard of length also is the *mètre*, which is a little more than our yard. Instead of our pound, moreover, they use the *kilogramme*, which is not far from two pounds. The unit of heat with them is therefore the quantity required to raise one kilogramme of water one centigrade degree. They call this quantity of heat a *caloric*. The unit of force is the amount required to raise one kilogramme to a height of one *mètre*. They call this a *kilogrammètre*. Now Joule's Equivalent reduced to these terms becomes: 1 caloric is equivalent to 425 kilogrammètres.

One of the most curious and most remarkable of the modes by which Joule verified the principle of the equivalence and mutual convertibility of mechanical force and heat, was one in which the mechanical force was changed into heat by being employed to produce fric-

JOULE'S APPARATUS.

tion among the particles of a fluid. The principle on which the apparatus acted is shown in the engraving. To the left is a reservoir containing a known weight of water, with a thermometer immersed in it to record the changes of temperature. In the centre of the reservoir is a species of paddle-wheel, with floats of copper, so arranged as to be made to revolve by the descent of a weight suspended by a cord which is wound around the axle. It was found that the descent of the weight raised the temperature of the water in a fixed and regular ratio, which, being carefully ascertained, was found not to differ sensibly from the ratio established by other experiments presenting the principle in very different forms. The experiments have been so numerous, and have been made in so many different forms and by so many different observers, as to leave no room for doubt that heat and mechanical motion are only two forms of force convertible by a fixed equivalent into each other.

The truth of this principle is illustrated in a thousand different ways by what we see taking place around us every day. If a musket-ball is fired against a wall the ball is heated intensely by the collision—that is, the motion of the ball, being arrested by the obstacle, is converted into heat. A horse trotting over the road imparts heat to every spot struck by the hoofs, and if the road is paved, so that the extinguishment of the motion is instantaneous, the heat is often sufficient to fuse and ignite the abrasion struck off from the iron of the shoe. The heat developed by the burning of coal in the locomotive is first, in a great measure, converted into mechanical force for moving the engine and train—the mechanical force so developed being the exact equivalent of the portion of heat expended in the production of it—and then this mechanical force is again converted into heat by the friction of the axles, of the wheels along the rails, and of the brakes on the periphery of the wheels, and by the innu-

merable shocks and concussions resulting from the inequalities in the line. Thus the heat originating in the coal is first converted into motion, and then, being restored again by frictions and concussions to the state of heat, is distributed all along the road. Thus if the lower degrees of heat were, like the higher, accompanied by luminous effects, we should see a line of light along the road after a train had passed, the result of the heat from the coal which had been left along the track, after passing through the intermediate state of motion.

The fact of the distribution of heat along a road by the frictions and concussions of carriage-wheels and horses' hoofs is made evident by the rapid disappearance of the snow from the centre of a paved street in a great city. The snow often remains unmelted at the sides of the street long after it disappears entirely from the part of the way beaten by the hoofs of the horses, and ground by the tires of the wheels.

The water of a brook or of a river develops a sensible, and sometimes a very great degree of heat, by the friction of the liquid against the banks, and of the various currents and eddies against each other. The amount of heat which any given quantity of water would thus develop, in passing through the whole course of the stream, is equal to that which, if converted into mechanical force, would be sufficient to lift that same amount of water from the level of the sea up to the level of the sources among the mountains from which the river takes its rise.

Of course the greatest amount of heat developed in the course of a river will be at those points where there is, within the same limits, the greatest fall. Calculations have been made of the quantity of heat which must result from the fall of the water in certain celebrated cataracts, and the consequent extinguishment of its motion in the abyss below. It is found that the amount must be great enough, in the case of the cataract of Schaffhausen on the Rhine, to melt daily over a hundred thousand cubic feet of ice. In the case of Niagara the amount of heat developed by the fall of the water must be almost incalculable.

In the same way the agitation and friction of the water occasioned by the incessant motion of the waves must have a constant and very material effect in raising the temperature of the water of the sea. Or, to express the effect in terms corresponding with the doctrine under consideration, the motion imparted by the winds to portions of the water, in being extinguished by collisions and friction against the rest, becomes converted into heat.

It is the same with the falling rain in a shower. Every drop develops heat by its friction in passing through the air—a degree of heat exactly proportional to the retarding effect produced by the friction. Retardation is the partial extinguishment of motion, and motion that is extinguished, be it much or little, becomes converted into heat. A still greater calorific effect is produced by the total extinguishment

of the motion remaining, when it reaches the ground. Thus the descending shower tends to warm as well as to water the ground. Even the lightest flake of snow can not alight without having its arrested motion operate to diminish, in a certain minute degree, the intensity of its cold.

The establishment of an exact equivalence between certain proportions of heat and of mechanical force has led to the determination of many other quantitative relations in respect to heat, such as the comparative degrees of facility with which different diathermic substances allow heat to be transmitted through them by radiation, and opaque substances by conduction—precisely in what proportions heat is *reflected* and *absorbed*, when falling upon the surfaces of different substances, or from differently constituted surfaces of the same substance—the different *capacities* of different substances for heat, that is, the different quantities of heat required for raising a given weight of them to the same temperature—the different quantities required for the fusion and for the vaporization of different solids and liquids—the different amounts developed by the combustion of equal weights of different kinds of fuel, and by other chemical actions—and also the precise proportion in which the heat consumed in working different kinds of engines is actually utilized by being transformed into mechanical force—and many other laws of similar character.

The following will serve as an example of the kind of reasonings and calculations referred to above.

Water is found by accurate measurement to expand to 1700 times its former bulk in being converted into steam under the average atmospheric pressure. In other words, if we suppose a tube, of an indefinite length, to stand in a vertical position, and a quantity of water of given depth to be placed in the bottom of the tube, and a film or thin plate of wood or metal, having no sensible weight, to cover the surface of the water and exactly to fit the section of the tube, without friction, so as to allow it to be forced upward by the expansive force of the steam to be generated by the boiling of the water, without allowing any of the steam to escape by the sides of it—thus forming a species of piston—and then if by the application of heat the water in the bottom of the tube is made to boil, the piston would be gradually forced upward as the steam is formed, until finally, when all the water is converted into steam, the piston would come to a state of rest at a height 1700 *times as great* as the space occupied originally by the water.

This of course is on the supposition that the steam is not superheated after being formed, and that no portion of it is condensed in the upper portions of the tube. We must accordingly suppose that the tube is kept, throughout its whole length, during the progress of the experiment, at the temperature of the boiling point of water.

This ratio of 1700 to 1 being thus established as the ratio of the spaces occupied respectively by water in the liquid state and by the same quantity of water in the state of steam at the same temperature—for the temperature, that is the sensible heat, as indicated by the thermometer, is not changed by the conversion of water into steam, the steam standing at 212° of Fahrenheit the instant after its formation, just as the water did at the instant before, notwithstanding that a great quantity of heat is absorbed during the process—we are prepared to take another step.

Let us suppose that the tube is square in form, and is an inch in dimension on each side, so as to give a square inch of surface to the piston. Let us also suppose that the water in the bottom of the tube is an inch in depth. We shall then have a cubic inch of water to be converted into 1700 cubic inches of steam—that is, the piston will have been pushed upward 1700 inches by the force developed.

Now we know that the ordinary pressure of the atmosphere is *fifteen pounds* upon every square inch. Of course the force exerted by the steam has been equivalent to the raising of 15 pounds 1700 inches, or about 142 feet. Now, 15 pounds lifted 142 feet is equal to 1 pound lifted a little more than 2000 feet, or 2000 pounds lifted one foot. The result we thus arrive at is that the heat absorbed in converting one cubic inch into steam, and thus disappearing as heat, becomes transformed into, or is replaced by, a mechanical force about sufficient to lift one ton one foot, against the force of gravitation. In other words, it develops a force of about 2000 foot-pounds.

The expression “horse-power” is often used in estimating the force developed by the action of a steam-engine. Of course the power capable of being exerted by a horse varies very greatly with the structure, strength, and state of health of the individual animal. It has been agreed, however—somewhat arbitrarily it must be confessed—to consider the force necessary to raise 33,000 *pounds one foot*, as a horse-power. In other words, a horse-power is equal to 33,000 foot-pounds.

It is found that the heat expended in the vaporization of 34 *pounds of water per hour* will develop a force equal to this; and as it takes about 4 pounds of coal of an average quality per hour to vaporize that quantity of water, it follows that the heat developed by the burning of 4 pounds per hour, vaporizing during that time 34 pounds of water, develops the same amount of force as that exercised by an average horse, exerting his full strength at any ordinary work.

It is abundantly proved by the various experiments and calculations here referred to, and by others analogous to them, that heat and mechanical force are convertible into each other in fixed and definite proportions. It is *inferred* from this that heat consists in some

kind of subtle motion—undulatory, vibratory, or gyratory—of the elementary atoms or molecules of which all material substances are *supposed* to be composed. This, however, is a mere theoretical inference, resting on the somewhat slender foundation that we can not conceive of force in any other light than that of some kind of persistent motion. But the human mind can not conceive of any thing, strictly speaking, but its own experiences; that is, can know nothing of what exists without, except the effects produced by the outward objects on the perceptive and reflective powers within. There may therefore be, as in fact there doubtless are, many modes of existence and of action in the natural world which have no power to reach or affect the human consciousness in any way. For us therefore to conclude that a cause must operate so and so, because *we* can not conceive of its operating in any other way, is a very unsafe deduction. In so reasoning we take substantially the logical position of the good old lady in the log-cabin, who, after satisfying herself by the most close and careful observation that the letters sent by the telegraph wire could not possibly pass any where on the outside of the wire, considered it proved, by that fact alone, that they must pass somehow or other through the *inside*—on the assumption—perfectly true in reference to *her* state of mind—that there was no other conceivable mode by which transmissions of thought could be made between distant places except by letters passing either inside or outside of the channel of communication.

BETROTHAL.

O FOR one hour of such enchanted light
As made a fairer daytime in the sky,
When on the willow-bank we sat that night,
My old-time love and I!

A while we talked so low and tenderly,
We felt the listening trees above us lean;
And louder far the silence seemed to me
That fell at last between.

Her heart lay floating on its quiet thoughts,
Like water-lilies on a tranquil lake;
And Love within, unknown, because unsought,
Lay dreaming half awake.

Ah, Love is lightest sleeper ever known!
A whisper, and he started plain to view;
Old as the heavens seemed our story grown,
While yet the moon was new.

And when she spoke, her answer seemed the while
Sweeter for sweetness of the lips that told,
Setting a precious word within a smile—
A diamond ringed with gold.

Then bloomed for us the perfect century-flower:
Then filled the cup and overran the brim;
And all the stars processional, that hour,
Chanted a bridal-hymn.

Ah, Time, all after-days may fly away,
Such joy as that thou hast but once to give,
And Love is royal from his crowning-day,
Though kingdomless he live.

SOUTH-COAST SAUNTERINGS IN ENGLAND.

[Saunter IV.]

HARMONY HALL.

THERE is a strong tendency to pessimism in the Anglo-Norman genius. It is not alone discoverable in those annual New Year reviews of the Old Year in the London press, which invariably kick out the passing year with an execration, and tell the new to its face that it promises to be no better than it should be, but even undertones Tennyson's rhyme when he bids the bells ring out the old, ring in the new :

"The year is dying in the night,
Ring out, wild bells, and let him die!"

"To-day is a king in disguise;" but the Englishman is not the man to unmask it. So I thought after I had parted, as told in my last Saunter, with Henry Taylor in the woods of Boscombe near Christchurch. I found that his impressions of the lower classes of his countrymen were absolutely hopeless. Most of them were, potentially, criminals, and the main problem was to invent the most suitable strait-jacket for them. His idea was that some life-long

useful work—a mitigated servitude—should be provided into which obdurate offenders should go from the police-court, never to return. Parliament had recently extended the suffrage, and had passed a stricter law against bribery; "but," said the poet, "there will be more votes sold at the coming election than ever before. Bribery can never be put down in England. In one form or another the rich will rule."

The election of 1867 was then close at hand. In every village where I stopped the people were astir, and the eager canvassers were hunting voters like pheasants. The walls were placarded with hand-bills in which candidates paraded their virtues and immaculate intentions, and uttered dark insinuations against their opponents. While walking amidst the pleasant lanes and bosky dells about Bournemouth the noise of the contest had been so distant that the judgments passed by the poet on his countrymen seemed harsh and unjust. But very soon after I had parted from him I found cause to remember them, and to see why it is that

the cultivated people of England look upon the lower orders with suspicion and hopelessness. A few minutes after leaving the gate that opens from Boscombe into the high-road I reached a place which contained a public house, a blacksmith-shop, a butcher-shop, and two or three laborers' cottages. I stopped at the public house for a bit of bread and cheese and a glass of ale, and was told the village was called Poken. In the room there was a printed list of the Conservative candidate's chief supporters—"Sirs" and "Reverends"—and at the table sat a farmer, a speculator in real estate at Bournemouth, and the village butcher, each with his glass of ale or spirits before him. They were, of course, talking politics. The butcher—rotund and heavy as any ox he ever slaughtered—declared his intention to vote for the Tory candidate. "Why?" asked the others; and the speculator proceeded to point out that the Tories had always resisted every reform in England, until they were conquered.—"But," urged the butcher, "we want a man of some interest in this locality, and the Tory candidate has purchased real estate in Bournemouth. He is a man of wealth, Sir!"—"But," replied the other, "how do you know but that he has invested only to get into Parliament, and, once in, will be rid of his Bournemouth lots?"—"Well, all I know is, he talks of settling here."—"But even if he does," put in the farmer, "what has that to do with the great question of the Irish Church?"—"Do you know," asked the butcher, with a wink of his swinish eye, "what is the first law of nature?"—"Self," said the other; "and that's the way rich Tories rule England."—The butcher shook his sides at his own cleverness, and will never know that every calf he kills is fratricide.

The three went their way. After all, he was but a more outspoken serf than they who enabled the oily representative of Westminster to float on golden wings into the seat lately adorned by the most independent thinker in England, who refused to bribe the people or to bow to their bigotry. Yet I remember the silent scorn of the gray-haired farmer as he took his leave, and am not converted to Mr. Taylor's view of the English masses. It is true that in every race between wealth and principle in the last election the former has won, and that household suffrage has left England in the old conservative ruts; but there are other reasons why radicalism had no gains in that canvass. The abolition of the Irish Church, however just to a nice sense, means popularly a fuller sway for the Catholic priest in Ireland; and the English people hate Popery, while they do not love the Irish. But the same eternal mills of justice—ever grinding slowly, but grinding "exceeding small"—which have got hold of the Irish Church may ere long have under their burrs the English Church, or the game laws, or land-privilege, or primogeniture, or hereditary legislation. Let us wait until some question involving the rights or interests of Englishmen arises

before we conclude that the majority of these people have their price, or that household suffrage is that innocent thing which has thus far left Parliament about as it found it.

A mile or two to the east of Christchurch, on a stream whose vulgar appellation is written *Muddey*, the wanderer turns to look upon the villa, shaped like an Oriental tent, built by William Stewart Rose, and named Gundimore, after the heroine of *Partenopex de Blois*, the old romance which he translated. Rose and his poems are now forgotten, but it has not been forgotten that his home was fifty years and more ago the beautiful resort of the finest men of the time. Coleridge, Morier, Ugo Foscolo, and Walter Scott enjoyed the princely hospitalities of Gundimore; and its master wrote a poem, named after his villa, which is as good as a "visitors' book" for recording his guests. "Here," he sings—

"Here witched from summer sea and softer reign,
Foscolo courted muse of milder strain.
On these ribb'd sands was Coleridge pleased to
pace."

And—

"Here Walter Scott has woo'd the northern muse;
Here he with me has joy'd to walk or cruise;
And hence has prick'd through Ytene'sholt....
Hence have we rang'd by Celtic camps and bar-
rows,
Or climb'd th' expectant bark, to thread the Nar-
rows
Of Hurst, bound westward to the gloomy bower
Where Charles was prison'd in yon island tower."

By the last two lines the reader may perceive that from the spot there is a fine view of the Isle of Wight and Carisbrooke Castle. Sir Walter repaid his host in kind. He adorns the Rose thus in the Introduction to "*Marmion*:"

"Ytene's oaks—beneath whose shade
Their theme the merry minstrels made
Of Ascapart, and Bevis bold,
And that Red King who, while of old
Through Boldrewood the chase he led,
By his loved huntsman's arrow bled—
Ytene's oaks have heard again
Renewed such legendary strain;
For thou hast sung, how He of Gaul,
That Amadis so famed in hall,
For Oriana, foiled in fight
The Necromancer's felon might;
And well in modern verse hast wove
Partenopex's mystic love."

In a very different way is the neighboring old mansion of High Cliff celebrated. This strange medley of the pinnacles, gables, and windows of many lands and ages, looking down on the sea which is steadily undermining the treacherous clay on which it is built—repaying thus ill the motto from Lucretius on its parapet—

"Suave mari magno turbantibus æquora ventis,
E terra longum alterius spectare laborem"—

was erected in 1763 by the Earl of Bute, whose greatness was thrust upon him by royal favor, as his descendant's recent fame has been thrust upon him by inheriting three hundred thousand pounds a year. It was he of whom Frederick

Prince of Wales said: "Bute is a fine showy man, and would make an excellent ambassador in any court where there is no business." Such a man was a jewel to the king who sent William Pitt weeping from his side. So on the accession of George III. (1760) Bute was made Privy Councilor and Groom of the Stole, to be followed year after year by the positions of Secretary of State, Knight of the Garter, and First Lord of the Treasury. Yet at the end of his third year under the King he had become so unpopular that he said, plaintively: "The ground I tread upon is so hollow that I am afraid of not only falling myself, but of involving my royal master in my ruin. It is time for me to retire." And so he came to dwell on the seashore with his wife, the Baroness Mont Stuart, the only daughter of Lady Mary Wortley Montagu. The happy life he passed in her fine society throws doubt upon the rumors of the day as to his improper intimacy with the Princess of Wales, after the death of her husband (Frederick, eldest son of George II.), to whom Bute had been Lord of the Bedchamber, without, it would seem from the Prince's estimate of him already quoted, gaining his favor. But whatever may have been the relation between him and the royal widow, it is pretty certain that she helped him to gain that ascendancy over the youthful Prince which enabled him, when the latter came to be King, to supersede Pitt in his counsels. To the choice the poor King made between those two men must be attributed the American Revolution! Who knows but that had Pitt remained in office American independence might not yet have been an accomplished fact? Poor Bute! one almost pities him on seeing him at length with all the shafts of ridicule sticking in him as if he were a political St. Sebastian. John Wilkes, Churchill, "Junius," goaded him as the witches did Falstaff. Nobody pitied him except the King, for it was believed he had been bribed to grant too favorable terms to the enemy at the close of the Seven Years' War. The fatal arrow was launched by Wilkes, and Bute came here to Hampshire; but even then he ruled the King's appointments for a time. The King, however, gave him up after every body else had. Then, said Sir Egerton Brydges, "his principal delight was to listen to the melancholy roar of the sea." It is just possible, if he had come to live here at High Cliff when he was thirty instead of when he was fifty, Bute might have done better; for his good pensions to literary men—£300 per annum to Dr. Johnson among them—show that he had a taste for letters. Moreover, unless he was charitable to the poor in his later days there must have been a vast deal of snobbery in his county, for I found in an old Hampshire miscellany some verses occasioned by his death, in which it was asked:

"Where is the hand whose soft benignant care
Once cheer'd the lonely cottage of despair?
Whose timely aid disarm'd the winter's pow'r,
And shed fair comfort o'er the shiv'ring hour?"

The Earl, after he had lost the King's friendship, and during the last years of his life, employed his time in chemical and botanical researches, and he wrote a work on English Botany, which the curious may find in the British Museum. The necessity of looking there for it involves the conclusion that the worst elements of character fostered by aristocracy had utterly turned this poor nobleman's head. His work on botany was in nine splendidly illustrated quarto volumes, the printing of which cost him ten thousand pounds; yet, after twelve copies had been printed, such was his exclusiveness, he ordered the plates to be destroyed!

The great charge against him was that of bribery; and it must be owned that Lord Camden has shown good ground for the suspicion of "Junius," in the fact that though Bute's patrimonial estate was worth only £1500 a year, he was able to invest £300,000 in land and houses. One of his sons was made Baron Cardiff in 1776, and the title of Marquis was conferred on the family representative in 1796. One of his daughters lived until 1851; she had some talent, and assisted Lord Wharnccliffe in his memoirs of Lady Mary Wortley Montagu.

The family is now represented by Mr. Reverdy Johnson's dear friend, Lord Wharnccliffe, who owns the portrait of the Earl, painted by Sir Joshua Reynolds, from which our picture is copied; by Lady De Rothsay, who resides at High Cliffe; and directly by the young Marquis of Bute, who lately came into his majority and his magnificent estates at Cardiff amidst the roar of cannon, amidst palm branches and hosannas; for is not a man with one and a half millions of golden dollars a year the fount of living waters? I do not remember any thing so comically serious as the impression made upon the English mind when the recent Bute festivities led to an estimate of his fortune. Hawthorne says the Englishman is "unimaginative;" but had he lived to read the London papers on the occasion referred to he would have discovered that there *are* things that can touch even the English imagination. The moral lecture of the *Daily Telegraph* upon the "Duties Consequent Upon Great Wealth," in which the Marquis was besought not to give away in charity too much—not more than one-tenth of his income for twenty years, at least—the conclusion, however, being admitted that "every body must and will have a course, a movement, and an impetus of his own;" the grave verdict of the *Times* on the startling pile of gold, that it really could not be interfered with by the House of Commons; and the general ebullition of all the snobbery in the United Kingdom, can never be forgotten by one who was in England when one day of last autumn forty gayly decorated steamers bore across Bristol Channel to Cardiff the owner—a boy of twenty-one—of that fourth port in the British Empire! The Prince of Wales had not a third as much money; the Queen has not a fifth as much to spend as she likes; and so, even with the Welsh and Scotch

dissenters who chiefly dwell on the Marquis's estates, Bute-worship was for a little time the prevalent religion.

Three months later came the thunder-bolt. Strange hints for some weeks before Christmas filled the air that a famous English nobleman was about to enter the Church of Rome. Who, none could tell; perhaps the poor, impecunious Lord Ranelagh meant to ask Rome to make his somewhat blasé name "beautiful forever." But when it became finally indisputable that the Marquis, after starting for the Holy Land, had paused a moment at Nice, there to be received on Christmas-eve into the Roman Catholic Church, the consternation was universal. It was not that John Bull cared about the Marquis—he might go to Rome without producing any sensation; but the money! One or two newspapers began to laugh it off; but they were soon warned that the transfer of a peer with £300,000 a year from the Church of England to that of Rome was no laughing matter. The feeling of John B. began to be so profound that the *Times* had to come in, as usual in such cases, to console its master.

"We know," it said, "the Marquis is very rich, but we have no evidence that he is either very learned or very wise. The presumption, perhaps, is against it.... When the husband of Queen Anne deserted James II. in his peril, the King observed that 'after all a good trooper would have been a greater loss.' In the same way the defection of an average curate would certainly have said more for the Roman Catholic religion."

Just here, however, the *Times* heard its royal master (*i. e.*, the upper middle class) cry: "Oh, hang your learning and wisdom and curates! What about that money?" Whereupon the *Times*, not without certain lip-quavers, whistled to keep up its courage thus: "People imagine that £300,000 a year has suddenly been transferred to the Pope. But of how much of that sum is the Marquis really master? Take away the necessary expenditure on the maintenance of his estate and his rank, and how much remains for the Pope's service?" Therefore, said the Thunderer, we are sorry for the Marquis; "but having said that, the less said the better." Meanwhile some of the most sagacious men in England recognized at once that the Church of Rome had made a most important conquest, and one which could not but influence seriously the pending religious conflicts

EARL OF BUTE.

of England. The Marquis, it is known, is a fanatic, and his ambition is very likely to take the direction of promoting the Catholic reaction in his country. That his money, directed as his new advisers will well know how to direct it, may accomplish much is as unquestionable as that his influence as a wealthy peer will be formidable. For he is not alone. There are 30 Roman Catholic peers, 50 baronets, and 38 Commoners of the same faith; and how they feel toward the English Church may be inferred from the late proceedings of the Duke of Norfolk, who, having five parishes which he must fill with English clergymen, put them up at auction in Fleet Street!

But now that I have reported what the England of the *Times* thought of it, let me quote here how two classes, which also have their strength, regarded the "perversion of the Marquis," as it was called. Two great representative men—whose names I must not mention—the one distinguished as a political, the other as a religious radical, I heard give their opinion of it. Both rejoiced in it. One

MARQUIS OF BUTE.

said: "What with Hastingses, Ranelaghs, Hamiltons, and Butes, we have some reason to hope that the whole false aristocratic system—false to the two vicious extremes of society, equally ruinous to Bute as to the pauper starving at his gate—is committing suicide. What with the irresponsibility of their property for debt, intermarriages, idleness, the old houses have run to seed, and the seeds are rotten; and every young nob who shows himself an ass or a black-leg does but help sweep away the modern refuges of ancient lies." The other said: "That both money and weight will be gained by this event for the Church of Rome is unquestionable; and, together with the decision against Ritualism, it may lead to a very powerful secession from the Church of England. For such a secession I, as a radical, watch and hope. Believing that, substantially, the two Churches are equally superstitious and equally worldly, I can not, of course, care whether men cross the frontier between them one way or the other; while, on the other hand, every reaction of the English Church Romeward has been fruitful of rationalism. As the first reaction after the Reformation planted a New England, so each one since has aroused Quakerism, Methodism, or something else—each a great liberating movement—up to the Tractarian movement, to which must be ascribed the birth of the Broad Church, with its 'Essays and Reviews,' its Colensos and Stanleys. If the judgment in 'Martin v. Mackonochie' (best pronounced M'Anarchy!) and the Marquis together do not yield us a new English Church I shall be grievously disappointed."

Rumor, of course, has attributed to the agents of Archbishop Manning herculean efforts to secure the Bute prize; but my belief is that such English Catholics as Newman and Manning care very little for him or his money. What they wish to win is brains. Their case is just that of Napoleon III., who could easily spare a score of millionaires to gain to his side an About or a Girardin. The splendor of the Tractarian or "Puseyite" movement was the brilliant intellects it bore to Romanism; since it we have heard only of rich merchants, noblemen, and fashionable ladies among its acquisitions, never of men eminent in the worlds of science, letters, or art. Another Newman, or Wiseman, or Manning, even another young Arnold, or Froude, or Aubrey de Vere, were worth a thousand Butes to the Church of Rome in England; for what it aspires to "pervert" is the thought, science, and political progress of the present age; but from the ranks of these not one steps forth with promise of filling the places of the leaders who are passing, not one to add to that Church the lustre of wit and learning which it needs so much more than the lustre of titles or gold.

If any one wishes to overleap the centuries and plunge into Old England—William the Conqueror's England—let him pass a week in the New Forest. He may not, indeed, nowadays enjoy the archæological pleasure of being set upon by highwaymen, and may be deprived of the antiquarian delight of being treed by a wild-boar; but nearly every primitive pleasure short of these the encroachments of civilization have spared him in that wild region. This largest and wildest woodland of Southern England is identified by historians with the *Natanleage* of Saxon chronicles (so named after Natanleod, the British chief conquered by Cerdic and Cynric, A.D. 508), and was afterward known as *Ytene*, a word signifying "Furze." The Norman conqueror preserved it, and placed it under the severe restrictions of the Norman forest laws, extending it too from Southampton to the Avon, including an area of 144,000 acres. William is, by our modern estimates, the original "English gentleman." According to the prejudiced, though contemporary chronicles, he was "the father of the wild deer," one who "loved the wild beasts as if he were their father;" his love being shown by his destroying fifty churches and exterminating numerous villages that the deer might have a pleasant home; also by ordering that whoever should kill a hart should have his eyes put out, similar protection being afforded the hares.

No Egyptian ever worshiped the Sacred Animals more than the conservative English gentleman, to this day, worships the game which fattens within sight of the starving poor; and in his eyes innate depravity is simply the tendency to poach. Nevertheless, the poor Saxons took their legendary revenge on their hard master, and asserted that William was met in the New Forest by a "Fearful Shape," which foretold for him and his family the terrible

dooms which were accomplished by the violent deaths which here overtook his sons Richard and William Rufus. The all-pervading legend of the forest, to this day, is the mysterious death of the latter—the second of the Norman Kings of England. In Lyndhurst Hall one may see his iron stirrup—10½ inches wide, 7½ deep; and near Minstead is Stoney Cross, which is the memorial stone marking the spot where the fatal oak stood. “Rufus Stone” is inclosed with iron, and on its various sides are the following inscriptions:

“Here stood the oak-tree on which an arrow, shot by Sir Walter Tyrell at a stag, glanced, and struck King William II. (surnamed Rufus) in the breast, of which he instantly died, on the 2d day of August, anno 1100.”

“King William II. being slain, as is before related, was laid in a cart belonging to one Purkess, and drawn from hence to Winchester, and buried in the cathedral church of that city.”

“That where an event so memorable had happened might not be hereafter unknown, this stone was set up by Lord Delaware, who had seen the tree growing in this place, anno 1745. This stone was repaired by John Richard, Earl of Delaware, anno 1789.”

“This stone having been much mutilated, and the inscriptions on each of its three sides defaced, this more durable memorial, with the original inscriptions, was erected in the year 1841, by William Sturges Bourne, warden.”

The theories of the event are various, some saying Tyrell had been bribed by Henry I. to slay the King, others that not he, but an outraged Saxon peasant, shot the arrow. As to the interpretation put on the event by the priesthood, one may read it in Matthew Paris’s “Chronicle.” There he may learn that the night before his death the King dreamed a javelin pierced his side, from which a fount of blood arose till it beclouded the sun; that the same night a monk saw the King gnawing off the limbs of a cross, until the indignant crucifix kicked him dead, a flame leaping from his mouth up to the stars; how Rufus further dreamed of devouring a child (which was of course the Church), until it cried, “Forbear! thou hast already taken too much!” upon which a bishop admonished him to cease his persecutions and avoid the chase that day; and how when the King met Tyrell he cried, “Draw, devil!” Finally, he will learn that the Earl of Cornwall, having strayed from the other huntsmen on the fatal day, saw “an immense swarthy stag bearing away the King’s body, all black and miry, and wounded in the breast. Then he adjured the stag, in the name of the Holy Trinity, to declare the meaning of this fearful thing. “I bear to judgment,” said he,

“your monarch, even the tyrant William the Red. I am an evil spirit, and the avenger of the wickedness which he did to Christ’s Holy Church,” and so forth. Thus the Wild Huntsman of the New Forest has become its legendary devil; though the other party contend that the oak where the event occurred used to put forth leaves in mid-winter to his honor. A few years ago the coffin of William Rufus was identified in Winchester Cathedral. With the skeleton was a broken arrow.

In 1859 Lord Palmerston said, in the House of Commons, that there was still “a Purkess in the Forest, who regarded his patrimonial piece of ground, handed down from father to son for some centuries, with as much pride as the peer of the longest pedigree and the squire of a thousand acres.” And the visitor still finds there the representative of old Purkess, the charcoal-burner, whose cart bore Rufus to Winchester, who still owns a cart and horse, and is as poor as his ancestor. But he will also find there troops of gipsies, who have haunted the woods from time immemorial, and who claim to have been the original stocks of the Lees, Stanleys, and other noble families—a gipsy girl having actually refused to marry a well-to-do farmer on the ground that she was a Stanley! And indeed no one knows but she was.

Next to Cornwall and Dartmoor the New Forest furnishes the majority of the gipsies whose Cheap Jacks, gingerbread, and roulette wheels line the English fairs and race-courses. Their normal work is, since the oppressive laws against pilfering, the making of baskets and general wicker-work; and on nearly every silent road one may meet their wagons loaded with such supplies. The old Acts of Parliament call them Egyptians: to the natural eye they are half-naked Hindoos, of a different tribe to the gipsies of Cornwall and Devonshire. They speak the mysterious Romany dialect. A friend of mine, who lives near the New Forest, wrote in a paper in *Fraser* last year that he had consulted the postman of the district, who said that few of the gipsies could read, and they

GIPSIES.

rarely received letters; they pick up many pennies by begging and fortune-telling; they have no religion; but his main puzzle was what they do with their dead, as he had never heard of a dead gipsy. They have mixed a great deal with the other foresters, and the latter are mainly the absorbed. He reports also that the dialect of the Forest is ungainly, harsh, drawling, and spoken mainly with the teeth shut. Here is a specimen: "Hev 'ee zeen t' fox, Jurge? they'se lost he, I bet!"—"Na-a-a! I zeed en goo into vuzz [*i. e.*, furze] at t' carner o' thic [this] 'ood."—"Big un?"—"Ya-a-as!"—"Where bist gwine now, then?"—"Whoam: thee's betterr come with I." The "r" has not a burr, but a thin, slurring sound. They have a good many words which are not usual in book-English, and some of them expressive; for example—"flisky," *small*, like small rain; "lous-ter," *noise*, *confusion*; "slummakin," *slouchy*, *careless*, *untidy*; "~~wiv~~very," *giddy*, as when the head swims; "mokins" are coarse gaiters; "humwater" is a cordial with mint in it. They call the bog-myrtle or sweet-gale the "gold-withy," and the white-beam "hoar-withy."

That which strikes the American, whose country hardly furnishes what can be called a dialect, is the wild misuse of pronouns. One may often read on the grave-stones of the Forest:

"Him shall never come again to we,
But us shall surely one day go to he."

These foresters are much better off than the common agricultural peasantry of England. Most of them hold their comfortable homesteads from ancestors who squatted on them. The Duke of Bedford tried hard in the last century to exterminate the squatters, but had to yield before their resolute resistance. It is curious to observe how, in one way or another, the lands and parks throughout England, originally set aside for the enjoyment of royalty or aristocracy, come at last to serve the people. The royal lands have now become popular parks; and even the immense slices into which the land was cut up for distribution among the first peers redound to the general advantage by preserving in a country, which otherwise would have been one vast city, the green spaces which are its lungs. To these must be added the fine harvests reaped by the artists, who have free range of all estates without the trouble or expense of the poor lord who has to preserve them. After all it is almost as difficult to monopolize land as sunshine.

The New Forest has shrunk to less than half its original dimensions. The crown gets about ten thousand pounds a year from it. All the Conqueror's care of the deer, and that of Charles II. also—who tried to add the red deer of France—has not availed to make that animal thrive here. They have now disappeared. The last stag hunt in the New Forest was in 1838, when fifteen hundred sportsmen assembled at the Rufus Stone to hunt down the last descendant of the stag at which

Tyrell shot. It was hunted into a barn, and secured by John King. He (the stag) was then removed to Windsor Forest, where he was known as "King John," and where his descendants still roam. There are in the Forest queer wild hogs, with unmistakably boarish traits, believed by some to have been derived from some German wild-boars introduced there by Charles I. There is also a curious shaggy little pony, something like the Shetland, said by tradition to have come of several horses washed ashore when the Spanish Armada was wrecked, which has its habitat here. These ponies are still believed by the more illiterate of the peasants to be waylaid occasionally by the "colt-pixy," a variety of the little fairy tribe spoken of in a former Saunter, which leads horses astray by "neighing like a filly-foal."

Fox hunting is now the chief "genteel" sport of the Forest, and I can sympathize with Gilpin's hate of it. There is certainly a dash of romance about the ancient hunt of the German and English forests. That which had been man's serious pursuit as a means of subsistence had as yet a kind of dignity about it, and was better than idleness. The animals to be hunted were treated with some consideration; they must not be molested under certain circumstances and at certain seasons. The stag must enjoy its childhood. It is a *calf* in its first year, becomes a *stag* in its fifth, and a *hart* in its sixth year. If the king has pursued a hart and it escapes him, he proclaims it to be a "hart royal," and thereafter it must be undisturbed. The owners of large estates in the Blackmore Forest, Dorsetshire, paid, up to this century—and, for all I can learn, still pay—"white-hart-silver," which was originally a heavy tax levied on the estates of their ancestors for their having killed a hart which the king had "proclaimed," after it had given him pleasure and escaped him. The hunting of these times must be only a mock hunting at best, as compared with that once witnessed in the old forests. Wretched harts and hinds are kept in parks and stalls, to be brought out now and then and chased on their feeble flight until they fall before the dogs, which inflict a few wounds, to be then driven off. The hart thus pursued is kept until its wounds heal, when it is again subjected to a similar torture. If royalty could do any wrong the amiable Queen of England would be prosecuted to-morrow by the Society for the Prevention of Cruelty to Animals, for of all animals in England that which has been most frequently and cruelly tortured by repeated hunting and wounding is "Her Majesty's favorite hind." The Queen, of course, never saw one of her stag-hounds or hinds, but the miserable conventionality which presumes that hunting is the favorite amusement of English royalty might surely attract the attention of a government sufficiently advanced to have such a sturdy Quaker as John Bright in it. Nevertheless, a majority of the

House of Commons would probably vote, even now, that the abolition of the game laws, the cessation of hunting, etc., would injuriously affect the British Constitution. And it is well known that Lord Palmerston (who in the House defended prize-fighting) was indebted for much of the confidence he received from both Whigs and Tories to his love of fox hunting. When John Bright was appointed to office an aged Whig was heard to sigh, "Well, at any rate, they say he catches a salmon splendidly!" With an unerring instinct he had, indeed, hit upon the statesman's one weakness.*

Now and then one may find certain regions in Great Britain where hunting seems to be hardly an anachronism; where it still represents the serious pursuit of the poor, and the natural exercise of the wealthy. One is thankful to believe that it saves some young squires and noblemen from the wreck of life which befalls those who leave their estates for the vices of London and the villainies of the turf. But, after all is said, the hunting squire is by no means a lovely character, and the month of sport is very apt to be also a month of dissipation. The element of daring having gone out of the hunt, has been followed by the spirit of the genuine old English huntsman. You will now and then hear of some old fellow who has tried hard to break his bones, and those of his friends, by erecting bush heaps, fences, etc., along the woods. I saw in Wales the portrait of a man who finally killed himself by his efforts to re-impart danger to the hunt, and his memory was held in much veneration; but as the forests shrink, and steam honeycombs the country, the animals become tame, and hunting excitement an affectation. Presently the velocipedes will supersede equestrianism; the horses will be chopped up to make cheap food for the million; the age of chivalry will no longer revisit the earth, even on Derby Day; and men will honestly set themselves to try and discover the characteristics, the beauties, and appropriate sports of their own age.

The pleasantest association I have hitherto had with the New Forest was that it had been the haunt of one whose name I had heard from the lips of Henry Thoreau—one who might almost be thought of as having reappeared in Thoreau—William Gilpin, author, artist, man of science, and clergyman. The descendant of that Bernard Gilpin, the pupil of Erasmus, whom the death of Mary unbound beside the stake upon which he was about to suffer, William Gilpin received the surplice almost as an hereditary mantle; but his heart worshiped with truest enthusiasm amidst these forest aisles. His works on the trees, forests, and general scenery of England, illustrated by his own pencil (with which he was almost as skill-

ful as his brother, Sawney Gilpin, the painter of animals), still have a value which few works written in the last century on subjects related to science possess.

He was an Oxonian, and upward of fifty years old when he received the living—he was poor, and had married an undowered girl because he loved her—in the village of Boldre, which was worth £700—a snug sum in 1777. An earnest, simple, and impressive preacher, a warm-hearted, industrious man, healthy and cheerful, he set to work in this wilderness; and while having an artist's eye, and a singular subtlety of observation, he divined the treasures of thought and beauty every where. He transmuted the money their publication brought him into schools for day-laborers. He was thus able to endow the schools at Boldre, Brockenhurst, and elsewhere, which still exist. In the Boldre school the day-laborers' children are taught free, the endowment being for twenty boys to be taught reading, writing, and ciphering, and the same number of girls reading, sewing, and spinning. In addition, the boys receive annually a jacket, breeches, and green vest, and the girls a black petticoat and green frock. The "green" was meant to be a kind of uniform. Near Brockenhurst Howard, the philanthropist, lived and labored three years, and the place became part of the parish in which Gilpin worked in the same spirit during the twenty-seven years of his life in the New Forest, where now his works succeed him in beneficent influence. During that period all the region around him was filled with alarms about the French Revolution, and every hill had a watchman on the outlook for a French invasion; many men were tried and imprisoned for seditious songs and words; public meetings to prepare for defense were held continually; and the British navy was grimly amusing itself and excited thousands by mock attacks and defenses of the Isle of Wight and other points about the Solent. But of all that noise and bluster (how contemptible now to all!) there is no trace in the serene and clean pages of this fine spirit, who left no cottage without trace of his humanity, and held every wild shrub or flower or tree in his discriminating sympathy. I say "discriminating," for he believed in the supremacy of Art, and could give Nature hard hits if she annoyed a fine scene by some deformity. I have found much amusement in reading a violent diatribe against him by a Hampshire critic, because of his perpetual snubbing of beech-trees! This "depreciation of the beech," says his antagonist, "disgusts our taste as well as offends our reason." Mr. Gilpin's particular admiration among trees was the ash, and among beasts the ass! On these points the critic just referred to is as furious as if Gilpin had spoken disrespectfully of the equator, being offended not only at the linear mark on the shoulder of the ass, and its long ears, but also at the associated ideas of its bray, its stubbornness and stupidity, and its being the mean-

* One who hunted in the woods without gun, and gathered from the streams without hook—Wordsworth—has reminded us

"Never to blend our pleasure or our pride
With sorrow of the meanest thing that feels,"

est beast of burden. Presuming the reader will have some curiosity to read the statement which elicited this criticism, I quote the passage from "Forest Scenery:"

"Besides the horse, the forest is much frequented by another animal of his genus, inferior indeed in dignity, but superior in picturesque beauty. I mean the ass. Among all the tribes of animals scarce one is more ornamental in the landscape. In what this picturesque beauty consists—whether in his peculiar character, in his strong lines, in his coloring, in the roughness of his coat, or in the mixture of all—would be difficult perhaps to ascertain. The observation, however, is undoubtedly true, and every picturesque eye will acknowledge it. Berghem bears full testimony to its truth. In his pictures the ass makes often the most distinguished figure; and a late excellent landscape painter (Mr. Gainsborough), I have heard, generally kept this animal by him, that he might have it always at hand to introduce in various attitudes in his pictures. I have heard also that a plaster cast of an ass, modeled by him, is sold in the shops of London; but I never saw it."

Accompanying this paragraph Mr. Gilpin has drawn a perfect love of a donkey, with a large pensive eye, a philosophical aspect, and a delicate visage, almost amiable enough to have justified the fancy of Titania. He admits the portrait is a little flattered. It is not a little remarkable that this artist and author should have anticipated by two generations the reaction favorable to the ass which has been observed both in France and England—in England especially, since the great Ass Exhibition which occurred in London a few years ago. Many of the animals exhibited on that occasion, by-the-way, were so beautiful, and they showed their possession of so many substantial qualities of mind, that there was a considerable enthusiasm about these "poor relations of ours," as Emerson calls them. Since the "Feast of the Ass" (January 14, commemorating the flight into Egypt) has ceased to be celebrated by the Churches, we have little idea of the honor in which this lowly animal was held. At that festival, in Britain and Brittany, it was customary for a beautiful young girl, with a babe at her breast, to ride on a splendidly decorated ass, through the streets, and to enter with the accompanying procession into the church, when the ass stood close to the great altar. In place of the usual responses the people brayed, and at the end of the services the priest brayed thrice. A chorus-hymn was then sung.*

* This old hymn, as written in a curious medley of Latin and French, has been preserved by Ducange. The following, if a somewhat rough, is nearly a literal translation of some of its verses:

From the country of the East,
Came this strong and handsome beast;
This able ass, beyond compare,
Heavy loads and packs to bear.
*Now, Seignior Ass, a noble bray,
Thy beauteous mouth at large display;
Abundant food our hay-lofts yield,
And oats abundant load the field.
He-haw! He-haw! He-haw!*

He was born on Shechem's hill;
In Reuben's vales he fed his fill;
He drank of Jordan's sacred stream,
And gambled in Bethlehem.
Now, Seignior Ass, etc.

Gilpin had the same disposition with Thoreau—the disposition, one may call it, of all men of genius—to find a glory in things generally regarded as mean. The ass was not the only Cinderella he drew out of the ashes. He finds an especial beauty in the notes of the woodpecker and the jay. "Their screams," he says, "however discordant in themselves, or when out of place, accord admirably with the forest, and produce that kind of local harmony which one of our old poets ascribes to the sound of a drum: it may be dissonant in one place, though musical in another.

'What sound is that whose concord makes a jar,
'Tis noise in peace, though harmony in war.'

It would be difficult to find a more felicitously expressed thought than that just quoted. Gilpin sometimes, though not like Thoreau always, saw the landscape tinted by "the light that never was on sea or land." How that light, which his eye brought with it, could illumine common objects may appear in this little allegory:

"As I sat carelessly at my window and threw my eyes upon a huge acacia which grew before me, I conceived it might aptly represent a country divided into provinces, towns, and families. The larger branches might hold out the first—the smaller branches, connected with them, the second—and those combinations of collateral leaves which specify the acacia might represent families composed of individuals. It was now late in the year, and the autumnal tints had taken possession of the tree. As I sat looking at it many of the yellow leaves (which, having been produced earlier, decayed sooner) were continually dropping into the lap of the great mother. Here was an emblem of natural decay. As I continued looking a gentle breeze ruffled among the leaves. Many fell which in a natural course might have enjoyed life longer. Here malady was added to decay. The blast increased, and every branch that presented itself bowed before it. A shower of leaves covered the ground. The cup of vengeance, said I, is poured out on the people. Pestilence shakes the land. Nature sickens in the gale. . . . Among the branches was one entirely withered. The leaves were withered, yet clinging to it. Here was an emblem of famine."

The Roman Catholic bishop, Dr. Milner, in his work, "The End of Religious Controversy," says: "One of the celebrated preachers of the Established Church, who of course 'never mentions hell to ears polite,' expresses his wish 'to banish the subject of everlasting punishment from all pulpits, as containing a doctrine at once improper and uncertain;' which sentiment is applauded by another eminent divine who

In leaping he excels the fawn,
The deer, the colts upon the lawn;
Less swift the dromedaries ran,
Boasted of in Midian.

Now, Seignior Ass, etc.

Gold from Araby the blest,
Seba myrrh, of myrrh the best,
To the church this ass did bring;
We his sturdy labors sing.

Now, Seignior Ass, etc.

The bearded barley and its stem,
And thistles, yield his fill of them:
He assists to separate,
When it's threshed, the chaff from wheat.
Now, Seignior Ass, etc.

WILLIAM GILPIN.

reviews that sermon in the *British Critic*." In a note the bishop refers the sentiment to a sermon by Mr. Gilpin. But if the vicar of Boldre was hopeful of the future of the sinners around him, he was so resolute in dealing with them in this world as to bring upon himself the charge of "popish practices." One of his parishioners, a wealthy farmer, with an affectionate wife and large family, having caused scandal by flagrant violation of the seventh commandment, Mr. Gilpin exhorted him tenderly; but the man continuing his offense, the pastor instituted proceedings in the spiritual court. When excommunication was about being pronounced the man asked for mercy, which was allowed on condition of his doing penance in Boldre church. On an appointed day he entered the church attired in a white sheet, accompanied by church-wardens, and read after Mr. Gilpin a paper containing an avowal of his offense, of his contrition, and his deprecation of the Divine anger. This was followed by a solemn discourse from the pulpit by the pastor. A woman, guilty of a similar offense, did penance in the same fashion on another occasion. The

people seemed to have acquired a childlike faith in the man in whom they saw, as Mrs. Southey did,

"Holy Bernard's life,
In apostolic grace unimpaired."

Mr. Gilpin was a fine-looking man, rather corpulent, his face being particularly remarkable for its expression of good-nature and simplicity. In his old age, with his long, silvery hair, his cassock and clerical staff, he was as picturesque a feature of the New Forest as any object he ever described with pen or pencil. The accompanying portrait is from a crayon picture owned by one of his descendants now living in Hampshire. There is a conventional monument whose superfluous eulogy may be read inside of the quaint old Norman church, whose original dedication to St. John was reaffirmed by Gilpin's life. The church is seven hundred years old. Many pilgrims visit the grave of this good man, which is in a beautiful spot, commanding one of the most charming prospects in England, including the Solent Sea, the Isle of Wight, and Lymington, where Boldre River flows into the sea. Never was there fitter spot for a child and intimate of Nature to be buried. His grave is beneath a fine maple which he especially admired. The simple stone bears an inscription written by himself:

"In a quiet mansion beneath this stone, secure from the afflictions, and still more dangerous enjoyments of life, lye the remains of William Gilpin, sometime Vicar of this parish, together with the remains of Margaret, his wife. After living above fifty years in happy union, they hope to be raised in God's good time, through the atonement of a blessed Redeemer for their repeated transgressions, to a state of joyful immortality; then it will be new joy to meet several of those good neighbours who lye scattered in these sacred precincts around them. He died April 5th, 1804, at the age of 80. She died April 14th, 1807, at the age of 82."

In his work on "Forest Scenery" I find interesting accounts of two remarkable trees which no longer exist. One is the "Cadenham Oak," which, it may be presumed, furnished the tra-

BOLDRE CHURCH.

dition that the oak under which the king was killed always put forth new leaves in midwinter. The Cadenham Oak did put forth leaves at the time stated, or about January 5. The foresters were not inclined to regard this as in homage to the Norman king, but maintained that it was a testimony to the old as against the present Christmas-day. The Duchess of Portland, however, reared in her garden a graft from this oak, which slighted both Christmas-days by blossoming on December 21. When Gilpin visited it he found that these premature buds, after coming out, soon died, and the oak was for the rest of the year in nowise distinguishable from the rest. The other phenomenal tree was the "Groaning Tree," near Baddesley. About a hundred years ago the groans heard from this tree filled the whole forest with excitement, and brought down large numbers of visitors, among them many naturalists, from London. Even the Prince and Princess of Wales paid it a visit. The farmer on whose ground the tree stood bored a hole in it with an augur, and no more groans were heard.

Among the monuments of the past amidst which the saunterer through these regions must wander, the prophetic memorials (if the reader will permit the paradox) of the Good Time Coming are not so frequent that one can lightly pass them by. And before I proceed on my southward journey I must ask the reader to accompany me to the little village of Broughton, nearly twenty miles north of the New Forest, where the English "Brook Farm" existed. I have been at much pains to secure some notes concerning it, for its history has never been written.

The English Communists, the first considerable body in this country who ever professed Materialism, and the only party, perhaps, that never possessed it, made their first practical settlement in Hampshire, at a time when society was hard and cold, taxation heavy, the people ignorant, and working-men hopeless. Robert Owen, the first to bring a breath of courage upon those evil days with which the present generation opened, and his disciples set up a propagandism, and subscribed money to create that situation in which it should be impossible for men to be depraved or poor. Looking around on the besotted and the criminal, Owen said, "Give me a tiger and I will educate it." In that faith he called around him the most earnest men of his time for the effort which represented more high sentiment and spiritual hope than any movement England has seen. The spot chosen for it was Broughton, a little village about fourteen miles from Winchester. Here was a fine property belonging to the Goldsmid family, with which Owen had some personal relations which enabled him to secure it on good terms—a signal advantage, it not being easy in those days to procure land for Communistic purposes. Owen's ideas were always vast and costly, and he was opposed to beginning Communities until the funds were in hand.

ROBERT OWEN.

But the enthusiasm of himself and his converts was at white heat. Owen had his grand fervors, and was quite convinced that Prime Ministers and distant nations would soon be asking him to remodel their governments. Among his adherents was a Salisbury banker—a great-statured, strong-minded man—who did not hesitate to lay ten thousand pounds at his master's disposal. Roads were made over the estate which the ancient Romans might have envied. Hansom, the architect of the Birmingham Town-hall, the first building of the kind erected in England which had any poetry about it, was called on to build the abode at Queenwood, which thereafter was to bear the grand but premature name of Harmony Hall. The lower rooms were wainscoted with mahogany; and indeed Solomon's Temple was hardly erected with more devotion; even the nails used were of a particularly fine quality. Unhappily all the funds were exhausted before the happy family convened. So from the start the land could not be properly farmed nor industry developed. The Millennium had not arrived in 1844; and the well-meaning who were ignorant, and the well-informed who were visionary—those who worked and never rested, and those who rested and never worked—crept in. It required a delicate despotism to manage them, and Owen and his school were merely philanthropists; the velvet glove was there, but not the iron hand beneath it. Owen's mind lacked the concrete element; it wandered out grandly in universal views; and it was maliciously said of him that when the nurses reported that the measles had broken out

in the children's wing, he answered that "he could not entertain the question until they all had it." Thus Harmony Hall came to know discord, and after a few years of struggle came to an end by a complication of disorders, such as are too familiar in such experiments to require mention in detail. The "New Moral World," as the neighbors called it, was seized for debt, and its inmates ejected. The trustees—a Liverpool iron-master, a Manchester merchant, and a London butcher—let the place for a large Quaker school, and it is now used for a school in which industrial features are joined to high class learning. A few years ago the poorer members of the Community had to sue the philanthropic trustees for their proportion of some surplus assets that had turned up, and the London butcher pleaded against them that the Bishop of Exeter had declared Owen's views immoral. Twenty years earlier the plea would have availed, but in 1862 England had ceased to believe in the infallibility of the Bishop of Exeter, and Lord Romilly said: "Ah, the Court hears all that, Mr. Green, but where is the money?" So the trustees had to refund.

Queenwood is a charming spot, and it is approached by an avenue worthy to open the way to the Millennium. It is a pity that no friendly hand has written of the interesting people who gathered there. When Robert Owen died it was stated that his son, Robert Dale Owen, was to be assisted by two eminent friends of his father in his biography, which would certainly give us some of the most valuable correspondence in existence, for Owen corresponded with nearly every public man of his time. It is to be hoped that the true story of his life will yet appear. Those who assisted in his Communistic efforts were mainly of the working-class, and in this respect differed from the Brook Farmers of Boston; but they were also men and women of marked individuality, some of them possessing genius. The most notable of them, perhaps, was George Jacob Holyoake, a man who has done as much for the elevation and enlightenment of the working-people of England as any man living. A mere boy when he began life as a reformer, Holyoake has still the elastic step and fair face of a youth as he steps along the Strand, with some bright idea leading him where a gold sovereign leads each of the throng around him—an idea which will presently shine in the columns of the *News*, or *Star*, or *Newcastle Chronicle*, or *Glasgow Herald*, or *New York Tribune*, or some other of the many journals which always find their account in printing the vigorous sentences of "Landor Praed," his favorite pseudonym. Holyoake joined Owen in 1836, and stood by his side through every failure; but when the Communists all concluded that the success of Socialism was only practicable in America, where society was more fluid and land cheaper, he remained to fight for a place for his ideas inside of the old society. He founded what is now known as Secularism, a kind of religion which

G. J. HOLYOAKE.

has regard only to the well-being of man on earth. It has now overspread this country, and is the mould into which its free thought is every where streaming. He has also been the chief man of the co-operative movements, and has written piles of pamphlets on co-operation, suffrage, the ballot, and kindred subjects, several of which have been discussed in Parliament. There was also at Harmony Hall Minter Morgan, a gentleman of fortune, author of a graceful Communistic romance entitled, "Hampden in the Nineteenth Century." He left his money to the Church, and founded an orphan asylum at Ham Common for children whose parents had died of cholera. Charles Bray, a Coventry silk-manufacturer, author of a work on "Philosophical Necessity," who was there, still writes works of ability in favor of Owen's views. The Salisbury banker joined the "White Quakers," the name given to the inmates of a sort of free-love Quaker monastery near Dublin, set up by Joshua and Abigail Jacobs, who went barefooted and in white garments. It is a metre of the excited condition of those times that a long-haired gentleman, much more a lady, walking through the country in a peculiar dress or undress, was sure to be fixed upon as a prophet. Thousands were ready to believe that any crack-brained vagary was the veritable pillar of fire.

But to return to the "Harmonians." Dr. Travis, one of their number, still lives and writes books amendatory of Owen's opinions on "the formation of character," claiming now that man has a self-determining power over his will. William Pare, whom the Bishop of Ex-

eter expelled from an office he held in Birmingham on account of his advocacy of Owen's views, was sometime governor at Harmony Hall, and is now a leading politician in Birmingham. A prominent figure in the movement was Thomas Alsop, a London stock-broker, an intimate friend of Coleridge, of whom he has printed some valuable reminiscences. Alsop was a friend also of poor Orsini, and was prosecuted by the English government for cognizance of the attack on Louis Napoleon. G. A. Fleming, who edited then the *New Moral World*, has been for many years on the parliamentary staff of the *Morning Advertiser*. Alexander Campbell, a clever Scotchman, who was at Orbiston—a Community in Scotland established by Abram (brother of George) Combe—went through Harmony, White Quakerism, Pierrepont Greaves's Mysticism, and the Ham Common Concordium, and now conducts the *Glasgow Sentinel*. Buchanan, another adherent, was an able speaker and journalist. He wrote ardent, not otherwise notable, poetry in his youth, and left on his death one son, known now as a poet of rising fame—Robert Buchanan. Lloyd Jones was an eloquent Irishman, a favorite "social missionary" of the Owen school. He afterward joined the "Christian Socialists," under the lead of Thomas Hughes and Lord De Grey. He had a son in our Union army in America. Indeed, a great many of the Harmony people went to America; among them Thomas Mackintosh, author of "The Electrical System of the Universe," a work of some note in pre-scientific days (he was drowned while bathing in the Ottawa); Mr. Green, who perished on an American railway; Thomas Bailey, a schoolmaster and copious writer, who, if now living, is among the Mormons of Utah; Dr. Frederick Hollick, a clear-headed writer, who is practicing at his profession in America; and John Finch, the iron-master already alluded to, who in America denounced religion as they only do who have a religion of their own to advance, and published a Bible revised for the Socialists, who never read it.

Harmony Hall had, like Brook Farm, many interesting women in it. The best known among them was "Kate" (Miss Reynolds), who afterward married the "pariah" prophet, Goodwyn Barmby, who has now settled down into a respectable Unitarian preacher. Mrs. Chappell-smith was the earliest female lecturer. She went to Indiana. Mrs. Emma Martin was both beautiful and eloquent.

But I must close my list, although I have not mentioned Ryall, Southwell, and others, who helped to make up this very remarkable assemblage of men and women. As they looked upon Queenwood they fondly imagined that Plato's Republic hovered above it waiting to descend. Proud efforts were made for its success; generous and holy hopes were centred upon it. No spot in this land sacred to poetry, antiquity, or political struggle should have to an American eye more moral beauty about it

than here, where Industry struck a peaceful blow for its emancipation. In that day Wretchedness smiled as a way seemed opening out of the pathless desert of drudgery. Toil-worn men from the anvil and the loom here sowed their last hard-earned pennies and their hearts as seed. They never reaped the harvest. They dwelt in their Promised Land as strangers, receiving not the promise. But their faith is justified to our generation in every co-operative movement, every trade union, and in all the hopeful humanitarian efforts of society. Conservatism, had it not been blind, would have paid much to have the Utopian elements of the human brain potted off into Harmony Halls and Brook Farms. They have been distributed by compulsion into the ordinary social veins; and household suffrage, co-operation, factory acts, in England, emancipation, woman's rights agitations, and the like, in America, are in no small degree attributable to their absorption. The old society swallowed the new, but digestion is a different thing from swallowing. The reappearance of Socialism is really one of the most salient features of our time. At the International Working-men's Congress held in 1868 at Brussels, and the International League of Peace and Liberty held the same year at Berne, the great subject of division was Socialism. In the course of those discussions—of which, though the debaters were working-men, M. Rochefort said, in his *Lanterne*, that no such eloquence could be found in the *Corps Legislatif*—some very interesting phenomena appeared. The leaders of the Socialistic party—by which I mean Fourierists, and those who believed in a distribution of land—were Russians, and their adherents were almost entirely from the hard, autocratic governments. The Russian, Polish, Hungarian, Spanish, and, in part, the French delegations, were for a Socialism like that which Owen maintained. On the other hand, the delegations from the freer governments, and in the exact proportion of the popular character of such governments—England, Switzerland, Belgium, and Germany—opposed it. In otherwise, just in the ratio that Socialism has gone into regular governments are the external Communistic elements weak, while the hard monarchies are directly training their subjects to an extreme radicalism. Of the two millstones of God—good and the denial of good—the nether is just as serviceable in grinding "exceeding small" as the upper. In Spain the Socialists are more compact in organization than in any other country; and they have been able by two formidable battles to show that no government can be permanent there which shall not, by its justice, make their organization unnecessary.

The Socialistic principle is very simple and universal. Every man who by riding in a car or omnibus—the common carriage—saves many times what he would pay for a private carriage, or who by sending his child to a public school pays but a tenth of what he would pay for a family teacher, avails himself of the Commu-

nistic principle. It is plain that by a common residence or common table people might save money as well as by having their carriage, their church, or their art-gallery in common; and nothing can prevent the springing up among the poor of lodging-houses, workmen's institutes and reading-rooms, soup-kitchens, co-operative stores, and the like, all of which are Socialistic. But just so soon as Communism aspired to abandon the ordinary materials and implements of society it really left behind the only people who required its aid, and the only people who could have formed a community. It implies thought, enthusiasm, study, and imagination for a man to become the practical devotee of an idea; and these are precisely what the life of the pauper and drudge has never permitted to germinate in him. But a man need not be a poet to take better rooms for less money in a model lodging-house, any more than to employ the common baker instead of making his own bread. The followers of Owen and George Ripley were men and women of extreme individuality; but for such to put themselves into a common drill was to set a pyramid upon its apex. For the very object of Harmony Hall or Brook Farm must be to secure from the pressure of physical toil more leisure and freedom for moral and mental culture; whereas such culture must at once manifest itself in an individuality inconsistent with a too close association with others. Culture affects taste, food, modes of amusement, and leads men to devote life to things which no Community can regard as produce. The possible Community must have men and women with minds full of the common question, How shall we exist? When Communism took the pen from Hawthorne's hand and put a hoe into it, it furnished its own *reductio ad absurdum*. Hawthorne plunged from the comfortable room that meant his real work into a snow-storm in order to do some other man's work. But if the inmates of Brook Farm had all plunged out of snow-storms and out of starvation, Brook Farm would have proved something else, though possibly nothing more valuable than the artistic study of a society sure to reappear in completed form on the American canvas.

How little does the world know its debt to such dreamers as they who built Harmony Hall! Palaces are built of mud, by men of mud; but these walls were raised by the lyre of Orpheus:

"Could I revive within me
Her symphony and song,
To such a deep delight 'twould win me,
That, with music loud and long,
I would build that dome in air,
That sunny dome!"

The great globe itself, yea, all which it inherit—how often have they been melted and changed like wax under the visions of dreamers! "Gladdened by that vision, he advanced toward the Pyrenees," writes Livy of Hannibal and his dream that he had received an envoy from Jupiter. In a dream Cyrus saw the sun

at his feet, and tried to grasp it. I own I can never think of the social visionaries—St. Simon, Enfantin, Owen, and the rest—but as the successors of those who by some dream of national grandeur, of nationality, or of religious enthusiasm have abolished seas and mountains. But for their noble discontent, but for their faith which made impalpable air seem as well worth their money as corn, were there any thing left but a mud-ball occupied by—Heavens, by what? Let one observe in to-morrow's *London Times* and *New York Herald* the photograph of the world to-day, so far as it is unvisited by any dream of the poor, chaffed, good-time-coming folk. I shall always believe that Mrs. Sigourney had some of the true fire, if only that she wrote, long ago, these lines:

"If thou wilt seek the fellowship of dreams
And make them friends, they e'en may bear thee up
From star to star, and let thee hear the rush
Of angel-wings upon God's errands speeding;
And, while they make some silver cloud thy car,
Will whispering tell thee that the unslumbering soul
Wears immortality upon its crest,
And by its very power to soar with them
Proves that it can not die."

The children of Utopia—they who feed on honey-dew—are, indeed, generally heretics; but so long as no bishop has so heavy a cross to bear, let it be remembered that men are to be judged by their fruits, and not by saying "Lord, Lord" by formulas the most unimpeachable. One of these dreamers I have read of, who, passing through a crowd, heard one say, "There goes a man without religion." He turned and said, gently, "I have religion enough to pardon your insult." It is for an orthodox world—for a society that a little while ago was burning them, and still denounces them—that such men devote all they have and are.

The names of Tom Paine, Robert Owen, or Holyoake are still potent to send the blood to the head of the orthodox; but, little as I coincide with their chief negations, I can not forget the lesson graven all over the region through which I am wandering of how the orthodoxy of one age may leave memorials from which the orthodoxy of another may recoil. The history of the stake and the fagot should make the Church more modest in its anathemas. But that which here I especially recall is the figure of one who was held in his time—two centuries ago—the embodiment of the religious zeal of his age—Matthew Hopkins, the witch-finder. That miserable fanatic hunted through these woods and fields more old women than huntsmen ever ran down foxes; and where he went his path was lit with the fires in which the wretched victims of superstition writhed in agony. Each witch burned or hung was treasured by Hopkins as a jewel in his crown of immortality, and he went through England to capture them as the revivalist now journeys to convert souls. Not only all the orthodoxy of the time, headed by Richard Baxter, but the judiciary, led by Sir Matthew Hale, and royalty, in the person of James I., were behind this devastator, who held free li-

cense to suspect whom he pleased, and to "test" poor women by tying their toes to their thumbs and "walking" them between inquisitors four-and-twenty hours, without food or sleep, to see if their "familiar" approached them (in the form of insects or vermin, for example), or if they sank exhausted—in which case, being unsustained by Providence, they were proven witches. But oftener the suspected witch was "swum;" that is, the poor creature, bound hand and foot, was thrown into the water, and if he or she floated it was by diabolical agency, and death was awarded; if they were drowned, at least their characters were cleared. This was a favorite method, because water was the element of baptism. All this was going on at the time when Harvey was discovering the circulation of the blood, and Boyle was founding the Royal Society. Hopkins charged twenty shillings per town for exterminating its witches. It is a satisfaction to know that Hopkins himself perished indirectly by his own cruel test. Suspicion fell on him, and he was "swum;" he floated! Fear as to the result of his trial, and the cold caught by his ducking, brought on swift consumption and death.

Of all the witch-trials those which filled this neighborhood with excitement from 1640 to 1653, causing the execution of two people, were perhaps the most curious and famous. The suspected persons were Dr. Lamb, Buckingham's domestic physician, and Anne Bodenham, his maid. Dr. Lamb, who was murdered as a wizard by a mob, was regarded by Richard Baxter as the most salient instance to be introduced into his "World of Spirits," which was "written for the conviction of Sadducees and Infidels." Baxter tells the story thus:

"Dr. Lamb, who was killed by the Mob for a Conjuror, about 1640, met one morning Sir Miles Sands and Mr. Barbor in the Street, and invited them to go and drink their Morning's Draught at his House. Discoursing about his Art, he told them that if they would hold their Tongues, and their Hands from meddling with any thing, he would show them some Sport. So, falling to his Practice, in the middle of the Room springs up a Tree; some after appeared three little Fellows, with Axes on their Shoulders and Baskets in their Hands, who presently fell to work, cut down the Tree, and carried all away. But Mr. Barbor, observing one Chip to fall on his Velvet Coat, he slips it into his pocket. That Night, when he and his Family were in bed and asleep, all the Doors and Windows in the House opened and clattered, so as to awaken and affright them all. His Wife said, *Husband, you told me you was at Dr. Lamb's this Day, and I fear you meddled with something.* He replied, *I put a Chip into my Pocket.* *I pray you,* said she, *fling it out or we shall have no Quiet.* He did so, and all the Windows and Doors were presently shut, and all quiet, so they went to sleep."

Such was the morning's sport which, assisted by the morning's cups of two gentlemen, cost the eminent physician so dear. His evil reputation proved deadly also to the old woman, eighty years of age, who lived under his roof. This Anne Bodenham was the wife of a clothier who lived near New Sarum, and she really seems to have had some faith in her magical powers, although it may be she was only turn-

ing a few pennies through the credulity of her neighbors. A Mr. Mason sent his servant, Anne Styles, to learn from the fortune-teller the result of a lawsuit in which he was interested. On this occasion, according to Styles's testimony,

"She took her staff and there drew it about the house, making a kind of Circle, and then took a book, and carrying it over the Circle with her hands, and taking a green glasse did lay it upon the book, and placed in the Circle an earthen Pan of Coals, wherein she threw something, which burning caused a very noisome stink, and told the Maid she should not be afraid of what she should then see, for now they would come (they are the words she used), and so, calling Belzebub, Tormentor, Satan, Lucifer appear, there suddenly arose a very high wind, which made the house shake, and presently the back-door of the house flying open, there came five Spirits, as the Maid supposed, in the likeness of ragged Boyes, some bigger than others, and ran about the House where she had drawn the staff; and the witch threw down upon the ground crums of bread, which the Spirits picked up, and leapt over the Pan of Coals oftentimes, which she set in the midst of the Circle, and a Dog and Cat of the Witches danced with them; and after some time the witch looked again in her book, and threw some great white Seeds upon the ground, which the said Spirits picked up, and so in a short time the wind was laid, and the witch going forth at the back-door the Spirits vanished."

The woman Bodenham then told the girl about her master's lawsuit, and received three shillings, which hardly could have covered the expenses of the performance, much less have indemnified her for its fatal results. When this alleged witch was condemned to death Anne Styles fell to weeping, and begged for her reprieve, which looks as if she had been telling lies. Bodenham denied all to the last, confessing only that she had a book of Charms, as doubtless many a servant-girl has a book of Dreams at this day—that she could say the Creed backward, and sometimes prayed to the planet Jupiter. After sentence she became completely insane. Before execution she wrote to her husband desiring him not to live in his house again, and asking the woman who was to "shroud" her to root up all the herbs in the garden; clamored for a knife, and begged to die drunk. She refused to have any prayer or other service at her execution, at which she gave the officials work enough, and died cursing all around her.

There was printed in the county of Hampshire a curious "Annual Repository," two volumes of which I have been enabled, through the kindness of a friend, to examine. There are records of the agricultural, social, and religious condition of the various parishes in the county, and many entertaining accounts of their antiquities. Of the latter I was struck with the form of a conveyance by Henry I. (A.D. 1133) of land to Southwick Priory: "I will and firmly decree that the said canons, their officers and servants, shall have and hold all their possessions.....free and unmolested from shires and hundreds and all manner of suits, pleas, and complaints, and payments for murders and larcenies, from homsuchen and forest

law, from scutage and hidage, gelds, denegeld, and homgelds, assarts, assizes, deodands, aides, summages, avepenny and hundred-penny, miskinnings and blodewyte." The American who thinks himself heavily taxed may find comfort in reading this list of the punctures at which the old land-owner of this realm had to bleed—unless, indeed, he were a Priory!

It was the Popes who began the system of heavy taxation in England; they bled their clergy in Britain, and the clergy bled the people. And when the Pope as head of the Church was superseded by the English kings, the latter were not inclined to surrender the old perquisites of Popes. When, however, many of these became odious to the people they passed into new forms and names. To this day no country is more heavily taxed. The population is about 30,000,000, the annual income £800,000,000, of which £320,000,000 are earned in weekly wages by the working-classes, and the property accumulated in the hands of the wealthy few is £6,000,000,000. The public debt is £800,000,000, requiring an annual taxation to pay its interest of £26,000,000. The army and navy cost annually £26,000,000. The various services—civil, diplomatic, judicial, postal, educational, and revenue collection, poor, police, highways—cost £40,000,000. For all of which there is a taxation amounting to £91,000,000 per annum, or about 11½ per cent. of the income. The various taxes are now named as customs, excise, stamps, assessed taxes, income and property tax, post-office, crown-lands, and miscellaneous. Customs date from the Conquest; excise was introduced in 1626; assessed taxes originated in "finage" or "smoke-farthings," levied at the time of the Conquest; stamp-duties are a Dutch invention; and the income-tax originated with Mr. Pitt in 1798.

The other extracts from these volumes which seem worth preserving I shall give without connection, as they are scattered in notes, letters, etc.:

"The winter in 1739 in these parts being extremely severe, a swan was killed in the harbor that had a ring round its neck with the King of Denmark's arms on it."

"The Chinese dwarf tree, which the accompanying drawing represents, is in the possession of Mr. Lance of Chessel; it was brought from China 9 years ago, and is of the kind described by Sir G. Staunton in his account of Lord Macartney's embassy, which the Chinese place on the low parapet walls that surround the halls and apartments in their gardens. There is the greatest reason to think that this tree can be clearly traced back to be 60 years old. It exactly represents an old forest tree. Its leaf more resembles an elm than any of our other forest trees. Its height is 18 inches, and the spread of its branches 24, its girth 6½, the leaves ½ inch long. A cutting of this tree, planted in a hot-house in April last, has made a shoot of eight feet and a half in length, and its leaf is about three inches long."

"Wild Parish Register.—No register of marriage during the reign of O. Cromwell."—"In the early part of this Register, as well as that of Medstead, there appears some beautiful handwriting, which seems to degenerate in after-times; this is evidently in consequence of the art of printing, and the consequent failure of monopolized qualification for state and other

social affairs, which were formerly cautiously preserved to clerks.—The old appellation of Goodwife appears to have given way to that of Dame."

"A person who keeps a public house by the seaside not far from Portsmouth told me the other day that he had lived seven years with the late Mr. Gibbon's father at Buriton; that the son (the historian) once flogged him severely for beating his dog; that he was always fond of reading, and seldom seen without a book in his hand; he did not cultivate an acquaintance with the young people of his neighborhood, nor even afford his father or mother much of his company; his beloved books riveted all his attention, and to books he sacrificed all the amusements of youth."

"Benefit of Clergy, Southampton, 1637.—Extract from *Books of the Court of Quarter Sessions*.—WHEREAS, Henry Whitely, nowe prisoner in the comon gaole for this countye, hath bene here at this present sessions indicted, and upon his tryall in that behaulfe convicted of foure sev'all felonies: viz., for the felonious stealinge of twelve turkyes, price 1s. a peece, of the goodes and chattles of John Stampe, gent., by one indictment; and for the like stealinge of tenn henns, price viiid. a peece, and seaven capons, price 12d. a peece, of the goodes and chattles of a man unknown, by another indictment; and for the like stealinge of a sack, value 14d., of the goodes and chattles of Humphrey Sutton, by another indictment; and also for the like stealinge of twoe hayes, value 2s. 6d. a peece, of the goodes and chattles of Ann Willingcott, widow, by another indictment, as by the same sev'all indictments thereof may appeare. And thereupon the sayde Henry Whitely having prayed the benefitt of clergy; which was allowed him accordinge to the lawe, if he could have reade; but forasmuch as he, the said Henry Whitely, being tried could not reade, and soe was incapable of that, the benefitt of the clergie; it is therefore considered and adjudged by this Court, that he, the said Henry Whitely, shall be from hence had to the said gaol from whence he was brought, and shall be from thence had to the place of execucon, and shall there hang by the neck untill he be dead, accordinge to the law. And the sheriffe is here commanded to see execucon done uppon him according-lye."

This benefit of clergy—*privilegium clericale*—constitutes a very curious chapter in the history of English law. It originated in a claim made by ecclesiastics for exemption from the jurisdiction of the common courts of law. After a great many expedients the exemption from ordinary punishments—with exception of those for arson, highway robbery, and ravaging a country—was allowed to the clergy, and was gradually extended to the clerks and retainers of the clergy. As these were generally the only class that could read, the ability to read was made the test of those who could claim the benefit of clergy. Persons thus exempted were burned in the hand, and then delivered over to the ecclesiastical court (which had been established by William the Conqueror) to be dealt with by canon law. Then followed a farce. The offender was brought before a bishop and required to make oath of his innocence; twelve witnesses called "compurgators" swore they believed him, and he was acquitted, though he might have been caught in the criminal act. The perjury involved in this induced the courts to rule that an offender should by benefit of clergy be only exempted from the death-penalty, not from the severest punishment next to it. The peers and peeresses, unwilling to be surpassed in privileges, had obtained, in the time of Edward VI., the privilege of the peer-

age; so that they, even if they could not read, which was often the case, could not suffer the extreme penalty. By statutes 7 and 8 George IV. the benefit of clergy was abolished, but that of the peerage remains, the most scandalous anomaly of English law. In America the clerical privilege was never recognized, though in Virginia and the Carolinas some judges even now append to their sentences the words "without benefit of clergy."

The fact that poor Whitely was executed for stealing things to the amount of \$1 62½ is hardly an antiquarian curiosity. When the Puritan pilgrims founded New England the English and Scottish law held over thirty different offenses to be capital; and it is an answer to the common theory that the Puritans were unusually rigorous that at the same period they recognized only ten capital crimes. It is as strange as true that up to 1832 death was practically awarded in England for stealing to the amount of £5. It was only when juries would not convict that England had to begin the work of mitigation. A thousand bankers petitioned Parliament to soften the punishment for forgery, in the interest of more certain punishment. In 1832 Sir Thomas Denman, Attorney-General, prevailed to secure the abolition of capital punishment for forgery; and in the same year false coining, horse-stealing, sheep-stealing, cattle-stealing, and stealing in a dwelling ceased to be capital crimes, through the exertions of Mr. William Ewart, M.P., whose useful life closed in the first month of this year. In 1833 Mr. Barrett Lennard carried his proposition exempting house-breaking, as distinguished from burglary, from the death penalty. In 1834 and 1835, on motion of Mr. Ewart, "hanging in chains" ceased to be a legal punishment; and returning from transportation, stealing letters from the post-office, and sacrilege were removed from the list of capital crimes. In 1836, on motion of Mr. Aglionby, the law for executing within 48 hours after sentence was abolished. In 1837 Lord John Russell's acts swept away such capital offenses as "cutting and maiming," rick-burning, attempted murder, robbery, burglary, and arson. The result of these acts was that in 1839 there were 56 executions against 438 in 1837. In 1840 Mr. Ewart gained 94 votes in the House of Commons for the total abolition of capital punishment. Such was the reaction against the old cruelties that for the twelve years preceding 1844 no execution occurred in London except for murder. The Society for the Abolition of Capital Punishment is still vigorous, and Mr. Charles Gilpin, M.P., never fails to appeal to Parliament on the subject. It has, however, been somewhat set back by Mr. Mill's opposition, and still more by the recent increase in brutal crimes in England, which has led the *Pall Mall Gazette* to clamor for the restoration of the death-penalty for confirmed thieves. Mr. Henry Taylor, the poet, has written a curious pamphlet advocating a kind of imprisonment for life, with servitude, in comfortable insane asylums, for

confirmed criminals. No doubt in the far future society will not only realize that crime represents moral insanity, but also how far it is itself responsible for the pauperism and ignorance which produce the base blood and deformed brains whose harvest is crime; and if the criminal can not read it will not be as of old a reason for hanging him, but rather for holding him more sinned against than sinning.

Turning now coastward again, we may well pause on one of the fine hills on the hither side of Lymington, and view the woody valley and the soft curves of the river as they widen down to the beautiful old town at which our present saunter must terminate. As we look downward the peaceful outlook is, like so many others in this region, disturbed by the ever-ascending fortifications which Pam* bequeathed to the England now liberated from his evil-eye. Yet I must not just remember the wickedness of "that wicked old man," as Cobden used to call him, for among sundry little felicities of his long, long reign he appointed to be Collector of Customs at this port of Lymington, and also pensioned, the Irish poet—the man who has written the finest modern lyrics in our language (after Robert Browning)—William Allingham. Who that has read that incomparable poem, "The Touchstone"—which Emerson read in the Concord Town-hall when John Brown was executed, and which went the rounds as his own—will doubt the high praise I have written? Ever since I read that poem I have hoped to take its author by the hand. It was with a thrill of pleasure that at last I met him; with some surprise, too, at finding him so young. He must be now about forty, but looks much younger, and is unmarried. Allingham is an English name, and there is some reason to think that an early ancestor of the poet's family gave its name to the town of Ellingham (*Allen's home*) in this county of Hants; but however that may be the family had long been Irish, and the father of William was a banker at Ballyshannon. And, by-the-way, in these days when Ireland is so apt to be set down as a "played-out" country in an intellectual point

* In 1860 Lord Palmerston proposed to the House of Commons an appropriation of nine millions of pounds to be spent upon fortifications for the defense of the English naval arsenals. The House was paralyzed by the audacity of the proposal, and surmising that only some peril invisible to the general public could have caused it, voted the money. Nearly the whole of this money has been spent, and it is now discovered that most of it might as well have been thrown into the Channel. The total estimate for the completion of the system of fortresses begun under Palmerston is £11,850,000. The works at Portsmouth alone require £1,192,000. They extend over 17 miles, and will require a defensive army of 70,000 men. It is now known that the shields used on these fortifications can not resist the attack of powerful ordnance at 200 yards distance. The shields are placed upon granite, and the impact of heavy shot crushes the granite, and the shields fall from their places. Several fortresses have been erected on Portsdown Hill, which is simply a big lump of chalk that crumbles away by the concussion of every gun fired from its own fortifications.

of view, it is worth while to note how largely the literature, science, and art of Great Britain has been during this century, and is now, indebted to Irish brains. Of departed magnates (regard being had to this century alone) we find Ireland has contributed Thomas Moore; Lord Rosse; Father Prout (James Mahoney); Dr. Todd (author of many medical works of high value); Samuel Lover, novelist and poet; Father Mathew; Mr. Spring Rice (afterward Lord Monteagle); Dr. O'Shaughnessy, who introduced telegraphs into India; Sterling Coyne, dramatist; D'Arcy Magee, the historian and politician; and George Petrie, historian, antiquary, and philologist, whose biography has just been written by Dr. Stokes. The celebrated family of Barrys was Irish—James, the painter, and Sir David, the physiologist. Sir Charles Barry, the architect of the Houses of Parliament, was of Irish extraction, though I am not sure that he was born in Ireland. The Brontës were of Irish, and not of French extraction, as is commonly supposed. They are of the Irish family of Prunty, or Brunty, in the North of Ireland. Dr. Doran also was an Irishman; as was also Wallace, the composer. When we come among the living we find such names as Professor Tyndall, of the Royal Institution; Mr. Lecky, the historian of Rationalism; Macclise and Mulready, the Academicians; Balfe, the composer; Sir William Wilde, Vice-President of the Royal Irish Academy; Sir W. R. Hamilton, Astronomer Royal for Ireland; Sir Robert Kane, the geologist; Whitley Stokes, the greatest Celtic scholar, and Chief Secretary of the Indian Government in Calcutta; Archbishop Trench; Lord Dufferin, author of "Letters from High Latitudes," and the fine satire on high life, "The Hon. Impulsia Gushington;" also Lady Dufferin, the writer of many charming Irish songs; William Carleton, author of "Traits and Stories of the Irish Peasantry;" Samuel Ferguson, author of "The Forging of the Anchor;" Julia Kavanagh; Frances Power Cobbe; Richard Doyle, long the chief caricaturist of *Punch*, and delineator of "Brown, Jones, and Robinson;" Mrs. Riddell, author of "George Geith;" Aubrey de Vere, the poet; Lord Chancellor Cairnes; Professor Cairnes, whose pen was so powerful in our late civil war; Dion Boucicault, the dramatist. I might, indeed, swell this list. In America several names will suggest themselves to the reader's mind.

Leigh Hunt was the first to recognize the genius of William Allingham, and to him the poet dedicated his first volume of poems (published in 1850), as to "one who encouraged my first literary attempts, and who since befriended me in matters of more importance." But Leigh Hunt was only the first to give a welcome to the literary fraternity of London which, after the publication of the "Day and Night Poems," in 1855, was accorded by Carlyle, Thackeray, Tennyson, Browning, and others, whose friendship has ever since repaid the poet for the lack

WILLIAM ALLINGHAM.

of popularity with "the million." He was for a time employed in a government office in Ireland, but was afterward removed to Lymington at his own request, where his salary is smaller, but where he is near his most intimate friend, Alfred Tennyson. In 1864 Allingham published what is in some respects his greatest poem, "Laurence Bloomfield in Ireland," in which the poet gives us much of his own mental and moral experience, blended with the life and soul of his suffering country. Mr. Gladstone spoke of it in the House of Commons as "an extremely clever work." The *Athenæum* said, "It is Ireland in miniature;" and the *Spectator* advised the Social Science Association to publish and circulate it. No one who wishes to see Ireland as it is should be without this admirable poem.

But Allingham is pre-eminently the poet of artists. His exquisite lyrics have suggested some of the finest works of Rossetti, Millais, Arthur Hughes, and others of the same school; and, indeed, a beautiful edition of his poems, published in 1860, contains fine illustrations by the three artists whose names I have given. Of his shorter poems "The Touchstone" is undoubtedly the best. It is one of those rare felicities which make up the coronet of thought. In a copy of the poems which I received long ago from the author, I find a verse added in manuscript. The reader may remember the theme of the poem—a man coming, whence none could tell, bearing a touchstone, whose spell tested all things, smiting the fair to foul, the foul to fair:

"Of heir-loom jewels, prized so much,
Were many changed to chips and clods,
And even statues of the gods
Crumbled beneath its touch."

The enraged people, seeing their goods brought to naught, imprisoned the man and burned the touchstone; and the poem, as published, closes with this verse:

"And when to stop all future harm,
They strew'd its ashes on the breeze;
They little guess'd each grain of these
Convey'd the perfect charm."

The verse appended in manuscript runs as follows:

"North, south, in rings and amulets,
Throughout the crowded world 'tis borne—
Which, as a fashion long outworn,
Its ancient mind forgets."

But I can not think this new verse adds to the "perfect charm" of the original conclusion. In 1865 were published Allingham's "Fifty Modern Poems," which have confirmed the opinion of poets and artists that their author is as a lyric writer almost incomparable.

I could not help thinking of how Hawthorne must have appeared in his customs office at Boston or Salem, when I found the poet in his dingy little room on the Lymington wharf, surrounded by dingy and dusty old ledgers and the like, and seated by a window looking out on barges and sailors. In front of him as he worked were portraits of Emerson, Carlyle, and Browning. At his dwelling, however, I found him happily environed with a charming library containing many rare old books, and with walls adorned by pictures repeating in another language his own creations, sent him by artists far and near. The windows opened out upon fragrant flowers, through which the vista, unimpeded by any house, stretched to the sea. Yet I doubt whether through these windows he had seen as much to stir his imagination as by that other dingy aperture in his office, where, as the ships and the sailors came in, he had received from them something beyond pecuniary fees, and of a kind they knew not of. Two poems, hitherto unpublished, I filched from his port-folio, both of which, I fancy, were borne in through that window on the wharf. The one relates to an anecdote of Napoleon's captivity, which is related in the "Memoirs of an Aristocrat, by a Midshipman of the Bellerophon," and is part of the romance of these shores. The ballad is entitled

CAPE USHANT.

Our ship, the stout Bellerophon,
Off Rochefort Harbor lay:
We took a passenger on board
And slowly sailed away.
Seven days and nights, with baffling winds,
We strove to fetch Tor Lay.

The eighth day, with the rising sun,
A morning in July,
French land upon our starboard bow
We plainly could descry.

When I, a little middy
(It's fifty years ago),
Came up to take my watch on deck,
Into the early glow.

Magnificently rose the sun
Above the hills of France,
And spread his splendor on the sea
And through the sky's expanse.

Meanwhile upon the poop, alone,
Our passenger stood there,
And view'd the gently gliding land
In clearest morning air—
The cliffs of Ushant, and the slopes
Of shadowy Finisterre.

"Ushant?" he asked, and I replied,
"Yes, Sire." Whereon he raised
His little pocket-telescope,
And gazed, and ever gazed.

For hours and hours he hardly moved;
And if his eyes grew dim
We never saw it; there he stood,
And none went near to him,

Till, with a faint and fickle wind,
We drew from off the coast,
And in a noontide haze of heat
France faded and was lost.

Napoleon's thoughts in that last look
It were but vain to seek;
Enough he had to think upon
If he had gazed a week.

And sometimes from his rock, perhaps,
He saw, amid the shine
Of lonely waves, Cape Ushant's ghost,
Far on the dim sea-line.

The second poem which I am permitted to print shows that the eye which looks out on Lymington wharf can see the daily fore-ground as well as great figures in the perspective of history. It is entitled

HOMEWARD BOUND.

Head the ship for England!
Shake out every sail!
Blithe leap the billows,
Merry sings the gale.
Captain, work the reck'ning;
How many knots a day?
Round the world and home again,
That's the sailor's way!

We've traded with the Yankees,
Brazilians, and Chinese;
We've laughed with dusky beauties
In shade of tall palm-trees;
Across the Line and Gulf-stream—
Round by Table Bay—
Every where and home again,
That's the sailor's way!

Nightly stands the North Star
Higher on our bow;
Straight we run for England;
Our thoughts are in it now.
Jolly time with friends on shore,
When we've drawn our pay!
All about and home again,
That's the sailor's way!

Tom will to his parents;
Jack will to his dear;
Joe to wife and children;
Bob to pipes and beer;
Dicky to the dancing-room
To hear the fiddles play;—
Round the world and home again,
That's the sailor's way!

Soon after reading this I walked out on the shore below the town and beheld it all in real

LYMINGTON.

life. Groups of women, some with children tugging at their aprons, were gazing through telescopes on incoming sails; now and then a cry of joy broke from their lips as some sail, bearing homeward the wandering Jack or Joe, was recognized; while at another spot, where tough mariners were landing, arms were held out and weather-beaten faces shining through happy tears. What partings, what greetings, may not a poet see from a wharf-window! But, for that matter, where is not the right human eye in place?

It is now about five years ago that Allingham was awarded a pension. There is something very graceful in the old custom of England which gives an annual stipend to such of her children as are least adapted to the common work of making money, all the more as it is generally given to those who have been most independent in their relation to the conventional creeds, and most faithful to ideals that had no dower to bestow. Such a fund as that which the Ministry has thus to bestow might easily be made into a mere bribe for sycophancy; but such cases have been so rare that it is in fact rather a testimony to the genius which no gift has perverted. There is something poetical in the fact that such a man as Leigh Hunt, for example, radical enough to pass two years in prison under the Prince Regent, had his old age made comparatively comfortable by the pension awarded him by Victoria. Carlyle, too, who consented through long dreary years to be painfully poor rather than turn his pen to the kind of work which promised gain, was pensioned by the nation which before and since he has remorselessly criticised. The pension is generally two or three hundred pounds. In Carlyle's case it is the latter sum, I believe;

but there never was a more opportune gift, and his friends still remember the happy scene when Leigh Hunt came with the happy news, for telling which Mrs. Carlyle kissed him!*

When not engaged in the work of his office, which, I have learned, he accomplishes to the complete satisfaction of all concerned, Allingham passes his time gathering lyrics among the wild-flowers and the trees of the New Forest, whose names and characters few know so well; and not unfrequently in the June days one may see Rossetti, or some other artist, using him as a chaperon in this fine society, which they prefer to the best which Belgravia can show. But still oftener he starts over the water with Faringford in his eye, and on the afternoon of such a day may be seen by the side of a tall, dark figure outlined against the white chalk cliff on the beach, or, it may be, with the cliff for a pedestal, against the clear blue that bends above the Enchanted Isle; for of all living none has so much received the confidence and love of the Laureate as this young Irish bard. Tennyson likes him chiefly, I think—next, that is, to his unusually fresh and agreeable traits as a companion—because of all the young poets in this country he is the least Tennysonian. Allingham's culture is, indeed, far more American than English, and few Americans are so famil-

* To this kiss, so characteristic of the humor and tact of one of the noblest of women, we are indebted for one of Leigh Hunt's improvisations:

"Jenny kissed me when we met,
Jumping from the chair she sat in;
Time, you thief! who love to get
Sweets into your list, put that in.
Say I'm weary, say I'm sad;
Say that health and wealth have missed me;
Say I'm growing old, but add—
Jenny kissed me!"

ST. THOMAS'S CHURCH, LYMINGTON.

iar with the writings of Emerson, Lowell, Walt Whitman, Thoreau, Curtis, and Hawthorne. He evidently holds Emerson as above all living thinkers, and treasures much a note he once received from Hawthorne.

I found it curious to walk about the old town, and, while conversing with one of the most modern singers, to reflect that our canes, every time we put them down, pierced to the dust of buried worlds. For Lymington is not only mentioned in Domesday-Book; there is evidence that it was a Roman camp; and before that Phœnicians worked the salt-tuns, which still exist, as they listened to Druid bards singing to their harps their own Ushant tragedies, and the "sailors' ways" of those days. A great place it is to dig up old coins and pots, which make one feel very close to those old people, and tempt one, like Taylor, the Platonist, to sacrifice a bull to Jupiter in one's back-parlor. "Lentune" it is named in Domesday-Book, afterward *Lyme Regis*, now Lymington, which, they say, means "a town on the stream." It used to be a favorite victim of the French sea-rovers, by whom it was three times plundered in the fourteenth century. During the civil wars it favored the king. Near here the Duke of Monmouth was captured after the battle of Sedgemoor, and the old story-tellers have a narrative that reminds one of the anecdotes told of the New England women in the Revolution. A party of the Duke's adherents used to meet at the house of a Mrs. Knapton to discuss national grievances over pipes and beer. Being discovered, a friend warned them of the approach of the officers, when Mrs. Knapton got the men out of the back-windows, cleared the table, and, to explain the suspicious tobacco-smoke, tied up her face, put a pipe in her

mouth, and when the constables entered appeared to be smoking to relieve a toothache. The stratagem succeeded.

The most interesting building in the place is the old church, built in the time of Henry VI., and dedicated to St. Thomas à Becket. It has been added to from time to time, and now, covered over with ivy, is quite picturesque. Cardinal Wolsey was once its curate, and one day he appeared not in the pulpit, but in the stocks near the door, for being drunk at the fair. This was before his (ecclesiastical) elevation. It is just possible that this incident, and the mixed character of the church's architecture, originated the ancient Lymington epigram:

"Old church and new steeple,
Lying parson and wicked people."

There are one or two curious entries in the parish register; one, under date of 1736, records that "Samuel Baldwyne, Esq., sojourner in this parish, was immersed without the Needles, in Scratcher's Bay, sans ceremonie, May 20." Samuel was not baptized in the sea, as the reader may suppose, but buried there, according to his dying request, to prevent his wife carrying out her avowed intention of dancing on his grave!

The first walk I took with Allingham was to the cottage, nearly two miles out of the town, where Southey married in his 65th year his second wife, Caroline Bowles, and where he lived for the rest of his life; and from this point we strolled to the sea-beach where he was one day found bareheaded and barefooted, a maniac. The second Mrs. Southey had some talent, as her "Chapters on Church-yards" show; but she was an uncultivated farmer's daughter. Some of the Bowles family still occupy the pleas-

ant cottage, which in the picture is that fronting the eye. The probabilities are that after this wife had become insane Southey's life with her led to his own insanity. It may be reasonably supposed that a man who had written over one hundred volumes, each one testifying to extraordinary labor, his brain was not able to bear the terrible stress put upon it. But it was a sad end for the mind which, without possessing genius, was skillful enough to write "Thalaba." He wrote exquisite prose, and after he had fastened his intellectual hose on Coleridge, Lamb, or Wordsworth, he certainly sent out the ideas so received in graceful fountains. Such charming ideas his friends found Southey's to be, not recognizing at all their own children. When Emerson visited Rydal Mount Wordsworth quoted and praised Southey. "But who is Southey?" asks Emerson. That was rather hard; for he was the hardest worker that ever lived in England; and nearly seventy years ago he preached a high faith amidst icebergs. The miserable reign of the Prince Regent had just begun when Southey wrote in England (1812)

SOUTHEY'S COTTAGE.

such texts for Dr. Channing as this: "It would have proved a striking part of a vision presented to Adam, the day after the death of Abel, to have brought before his eyes half a million of men crowded together in the space of a square mile. When the first father had exhausted his wonder on the multitude of his offspring, he would then naturally inquire of his angelic instructor for what purposes so vast a multitude had assembled; what is the common end? Alas! to murder each other—all Cains, and yet no Abels." Southey's son, a clergyman of the English Church near Ilchester, recently found among his father's papers, and forwarded to *Fraser's Magazine*, some fragments of a "Life of Sir Philip Sidney," possessing considerable merit. It was probably his last production.

I am continually amazed at the discovery, on this little island with its millions (of which several are counted in no census), of so many nooks and by-ways where people live as remote from the great world as if they were in the forests of America. In their primitive dress and mushroom cottages, about which they train vines and flowers on borders adorned with shells, these English of the southern coast seem more like French peasants than like the hard, strong-minded, gin-drinking laborer of the northern counties. When the lump of chalk of which Northwestern Europe is composed was cut in two by the Channel, there was a French leaven left among these peasants. As we were walking through a little village of two or three straw-thatched houses I observed nearly all the children playing at the doors, and spoke to one of them, but the mother near by stopped her washing and listened with anxiety. My companion suggested that it were best not to speak to the children; the entire region was in a state of panic on account of a fearful murder which had lately been committed in the county on a little girl whom a well-dressed stranger had enticed from her parents' door with some pence. Allingham seemed to enter into the inmost na-

ROBERT SOUTHEY.

ture of these poor people, and knew the cottage which was most enriched by agrimony, or that which rejoiced in a *tree* of the feathery pink-blossomed *Tamatrix Gallica* (which is generally a bush). One day a storm overtook us, and we found refuge in the lowly but artistically ornamented cottage of a poor woman, with whom he conversed as wisely as if he had been born and reared in it on all the shrubs of the garden. Then we sat down and talked of Comtism, Kantism, and of Tyndall's explanation that we are all little engines with boilers full of motive in us, steaming away over spirit-lamps, which some chance draught blows out, and there is an end of us. The woman listened with wide eyes, not quite sure whether or not she was harboring two escaped lunatics. Like all other modern poets of this country, Allingham is fascinated by the revelations of science, and not only sees every insect or leaf through two lenses—his own imagination and the eye of Darwin or Huxley—but botanizes a little on the humanity vegetating around him. A little too Irish for the English, and too English for the Irish, he has a tinge of melancholy derived from the experience of many alienations, but finds a restoring companionship in his relations with Nature and the Muse. The few days I passed with him will long retain their sunshine.

In the neighborhood of Lymington the shrubs and wild-flowers seemed to me especially charming, and the notes of the birds particularly sweet. I have observed that the natural characteristics of England are in several respects curiously anticipative of those of New England. The English fog is a rough stem of which the American Indian summer may be regarded as the fine flower. The russet autumn is a fair prelude to the more radiant hues of the same season across the Atlantic. The birds here bear on their wings foreshadowings of the brilliant colors with which their transatlantic relatives light up the forests. The songsters here have finer notes than ours, but for each of them we have a corresponding, if inferior, singer in our American woods. The mavis or hermit-thrush utters a less sustained music than the nightingale, but it is kindred; and our meadow-lark is a less jovial—a Puritan—sky-lark. The whip-poor-will is, however, certainly an improvement on the cuckoo. There is something mystic in the feeling with which one looks upon the violets blooming over the dust of buried races, or listens to larks singing over the barrows of forgotten conquerors. Neither Saxon nor Norman was arrayed like one of these. The kingdoms of violence pass: beauty is immortal. This little violet still brings its bit of heaven to earth amidst the mould of shrines and mansions.

"The air is sweet with violets running wild
Mid broken sculptures and fallen capitals."

It is a proof of the poetic instinct in human nature that it has invested the trees and flowers with its most sacred beliefs and sentiments.

They are copied in cathedral arches and foliations, and blossom in tinted windows. The religious chronicles of England are full of traditions of the religious natures of trees and flowers. They constitute a floral Christian Calendar in their names, and Christian Year in their blooming and closing. Among the consecrated growths of England the hawthorn is eminent. When Joseph of Arimathea wandered into Britain—and there is hardly a saint that has not been here—he laid him down to sleep on the grass, and when he awoke found that his staff had blossomed into a hawthorn cluster; this he deemed a token that he should erect a church on the spot, and that is the way the old Glastonbury church came to be built. The old Glastonbury hawthorn-tree, whose trunk was supposed to be Joseph's staff, was such an object of reverence in Cromwell's time that he thought it necessary to uproot it. It was, however, beyond the power of Cromwell to reach the root of it in the popular mind, and its sanctity was distributed to the common hawthorn which lines so many roads in England, though the latter are of a very different species. The French call it *l'épine noble*, because it was supposed to have furnished the thorns which pierced the brow of Christ. But of all plants the St. John's-wort—the curative herb of John the Baptist—has had the widest connection with popular superstition. I have already alluded to its supposed virtues in healing the soldier's wound. It was anciently called *Fuga demonum*, and was the chief devil-fuge. On the vigil or eve of St. John's Day, in many parts of England, it was the custom, even within this century, for country people to build bonfires and dance around them, with John's-wort encircling their brows, invoking a fruitful year. These bonfires were founded on the declaration that the Baptist was a burning and shining light. The ritualist lights his candles, much in the same traditional line, to declare Christ to be the Light of the World. Formerly on St. John's Day (June 24) few houses were without a sprig of John's-wort over their doors. The custom survives in many villages of France and Germany. In Lorraine the peasant refuses to cut his grass before that day, whatever be the weather. It is a curious fact that in the Levant, notwithstanding many sad experiences to the contrary, the peasantry maintain the belief that any plague that is raging must disappear on the 24th of June.

But these galaxies of the sod not only record religious legends, as the constellations over them preserve classic mythologies; their popular names in many cases trace the natural poetry of the human mind and its earliest gropings after scientific description. Such are the heart's-ease, pansy (*pensée*), daisy (*day's eye*), shepherd's-warning, forget-me-not, Venus's looking-glass, traveler's-joy, lad's-love, virgin's-bower, way-bread, wayfaring-tree, shepherd's-needle, maiden-hair, wake-robin,

dandelion (*dent de leon*), pheasant's-eye (which the French call *goutte de sang*, in remembrance of the fable that it sprang from a drop of the blood of Adonis), queen-of-the-meadow, honesty (*lunaria* or moon-wort), celandine (i. e., *cheladonium*, a name preserving a belief, old as Pliny, that the swallows use it to restore their sight), little-thrift or lady's-cushion, ox-eye, cuckoo-cup. This last is also called here, as in America, butter-cup, on account of an old theory that the cows derive from it that which makes the butter yellow. An old writer—Gerarde—says it is called cuckoo-cup because "it flowres when the cuckowe doth begin to sing her pleasant notes without stammering;" but it seems rather to refer to the old theory that its cup holds a liquid which the cuckoo drinks. Hence it is also called the cuckoo-pint. It is the same as Shakspeare's cuckoo-buds which "paint the meadows with delight." Spread out, too, over these meadows is the "lady's-smock, all silver-white," so easily mistaken at a little distance for the whitest linen laid out for drying that one perceives that not even

Shakspeare's line is so perfect as the human eye's description of its virginal purity preserved in the name, Our Lady's smock.

In England Nature so completely defines the seasons and the hours by the budding and withering, the opening and closing of the flowers that it is no wonder that the floral dial existed in the verse of Marvell long before Linnæus contrived it with his forty-six flowers at Upsal. And as the water-lilies, which illuminate these Hampshire streams as bountifully as they do those of Massachusetts, warn me by their folding that my last day at Lymington has closed, I end my Saunter with the incomparable lines from old Andrew's "Garden," which the gentle mystic of Concord—Alcott—has made a household word in New England:

"How well the skillful gardener drew
Of flowers and herbs this dial new!
Where, from above, the milder sun
Does through a fragrant Zodiac run,
And, as it works, the industrious bee
Computes its time as well as we.
How could such sweet and wholesome hours
Be reckoned but with herbs and flowers?"

A BRAVE LADY.

BY THE AUTHOR OF "JOHN HALIFAX, GENTLEMAN."

With Illustrations.

CHAPTER V.

THAT to-morrow, of which Josephine Scanlan spoke so calmly, turned out to be the crisis of her life.

To make up her mind to this visit to the Rectory cost some pain. It was like assuming her husband's duty; doing for him what he was too weak to do for himself; and, though many a woman is compelled to do this, still it is only a mean sort of woman who enjoys the doing of it, or likes being made perforce a heroine because her husband is a coward.

Ay, that was the key-note of Edward Scanlan's nature. He was a moral coward. Physically, perhaps, he had the bravery of most Irishmen; would have faced the cannon's mouth; indeed, it was always his regret that he had not been a soldier instead of a clergyman. But to say No to an evil or unworthy request; to enter an elegant drawing-room in a shabby coat; in short, to do any thing awkward, unpleasant, or painful, was to him quite impossible—as impossible as it would have been to his wife to go away and leave it undone.

She knew this well; it had been forced upon her through years of bitter experience, and, therefore, she nerved herself to undergo her double humiliation: that of asking a favor which might not be granted, and of reading

in the rector's shrewd eyes, though he might be too courteous to say it, the knowledge that her husband, and not she, was the person who ought to have come and asked it. She knew, too, that all sorts of common-sense questions might be put to her. Why could they not make ends meet?—other people did who were no better off than they, and had as many children. Perhaps, too, even Mr. Oldham would side with the opinions of the other two men—Mr. Scanlan and Mr. Summerhayes—against her—only a woman! and recommend that they should try to better themselves by seeking their fortune in London.

Seeking one's fortune! A bright, bold, happy thing to do—for a young woman with her young husband, in whom she has full faith, and for whom she is ready to give up every thing and follow him cheerfully, in weal or woe, throughout the world. Ten years ago Josephine Scanlan would have done it gladly with the Edward Scanlan whom she then believed in—Now?

She could not do it; she dared not. With those six little ones intrusted to her charge; sent to her by God Himself, to be her crown of comfort, to keep her heart warm, and open a dim vista of joy in the heavy future, which otherwise might have closed blankly upon her like the dead wall of a cave—no, it was impossible.

The thought of them, and this only alternative of saving them from what she felt would be utter ruin, beat down the cruel feeling of shame which came upon her whenever she considered how she should speak to Mr. Oldham—into what words she should put the blunt request, "Give me some more money?" For she knew that, in degree, her husband was right; the rector was rather hard in the matter of money. That is, where he did give, he gave liberally enough; but he disliked being encroached upon, or applied to unnecessarily; and he was so exceedingly accurate himself in all his pecuniary affairs that he had a great contempt for inaccuracy in others. He had, too, on occasion, the power of making people a little afraid of him; and, brave woman as she was, I think Mrs. Scanlan must have been slightly afraid too—conscious of that sensation which children call "their courage slipping down to the heels of their shoes"—as she sat, lacing her poor, half-worn, nay, shabby boots, on her delicate feet, the morning she had to walk down to the Rectory.

It was a burning hot morning in the middle of June. I can picture her, for I know exactly how she was dressed. She had on her usual print gown, with a tippet of nankeen, and a gipsy hat, such as was then the fashion, of coarse black and white straw. She used to plait this straw herself, and make it into hats for her own use and for the children—large, shady, and comfortable, tied across the crown and under the chin with green ribbon. Her costume was, perhaps, not quite matronly enough, but it suited her circumstances; the lilac print gown washed forever; the hat was much more convenient than the gigantic bonnets, heavy with feathers and flowers, which were then in vogue—and much more economical besides. With her stately gait and still slender, girlish figure, upon which almost any thing looked well, I have little doubt, though the Ditchley ladies who met her that day might have set her down as dressed rather oddly and unfashionably, there was something about Mrs. Scanlan's appearance which marked her unmistakably as "the gentlewoman."

She walked quickly across the common, and through the town, for she wanted to get rid of some ugly thoughts which oppressed her; and, besides, whenever a difficulty had to be met it was her nature to meet it as soon as possible. "If I had to be hanged," she would say, "I would rather be hanged at once. Reprieves are intolerable."

It was not often she quitted her own house for other people's now. For months she had not been inside the pretty Rectory, and the sight of it in all its summer beauty aroused old remembrances and vain desires. Desires not for herself, but for those belonging to her. Had she been alone she almost thought she would have lived on forever at Wren's Nest, dilapidated and dreary though it was growing. But—her children. It was now most difficult to stow

them all away within those narrow walls; and, as for making them really comfortable there, the thing could not be done at all.

She counted them over, her pretty flock: manly César, delicate Adrienne, Louis, who bade fair to be the cleverest of the tribe, Gabrielle, growing up with all the health and beauty that her elder sister lacked, Martin and Catherine, baby nonentities still, but fast turning into individualities, like the rest, for the mother's character had impressed itself upon every one of her children. They were not commonplace at all, but had each strong wills and decided tastes. Poor little souls! How hard it would be to repress their dawning talents and aspirations, to bring them up little better than laborers' children, for so it must be—how could it be different? She did not know where even food and clothing were to come from, to say nothing of education. Oh, if she only had a little money! merely the crumbs from the rich man's table—the merest tithe of that wealth which Mr. Oldham spent so carelessly upon his garden, his conservatories, his beautiful and tasteful house.

She began to think that after all her husband was right in his complaints against fate; that blessings were very unfairly divided, especially money; and that it was hard this childless old bachelor should have so much, and she and her poor young tribe so little. Did the good God look with equal eyes on all? Did He see how she suffered? Was it any use to call upon Him, and ask Him to help her? Not in one of those voluminous and voluble prayers which her husband poured out night and morning, to the phraseology of which she had grown so accustomed that now it all went in at one ear and out at the other. She either never listened at all, or listened with a slight curl of the lip, incredulous both as to the prayer itself, and, God help her, to the Hearer of it also.

Blameworthy she might be—ay, she was. She ought to have been Christian enough to judge between the sham and the reality; wise enough to know that all the musty human curtains hung between may darken the soul's daylight, but can never blot out the existence of the sun, the great Sun of Righteousness, who shines forever above and upon us all. But she was also deeply to be pitied; for the man who made this woman half an unbeliever stood to her in the closest relation that one human being can stand to another, the ruler of her life, the centre of her world, her priest, her lord, her husband.

Usually she was too busy, from hour to hour, and from minute to minute, for these ill thoughts to come; thoughts which, beginning in lack of faith in man, ended in lack of faith toward God; but to-day, in her long, lonely, fatiguing walk, the devil had had full opportunity to attack her. She felt his cruel black wings flapping behind her at every step she took, and she flung the Rectory gate after her with a clang, hoping in that pleasant, peaceful garden to shut him out,

THE RECTOR AT HOME.

but he would come in. He seemed to jeer at her from under the faded laburnums, and behind the syringa bushes—those mock-orange blossoms, with their faint, sickly smell, sweet at first, but afterward growing painful to the sense. They reminded her of many marriages, which begin so bright at first, and end—God knows how! Marriages in which nobody is particularly to blame, and of which the only thing to be said is, that they were altogether a mistake—a sad mistake.

“But nobody knows it, and nobody ought to know,” said to herself this thirteen-years’ wife—apropos of nothing external—as she walked on in her rare solitude, thinking she would give herself, and the devil, no more opportunities of the same sort again; and forcibly turning her mind away from other things to the special thing she had that morning to do.

She found Mr. Oldham, not in his study, as she expected, but sitting in his veranda. The day was so hot and his book so uninteresting that he had fallen asleep in his arm-chair. As she came suddenly upon him thus he looked so withered and wasted, such a forlorn specimen of a solitary old bachelor, with not a creature to look after him, not a soul to care whether he was alive or dead, that the wife and mother who a moment before had been bitterly envying him now felt a sensation of pity. Her own full, bright home, alive with little voices, and this lonely house and silent garden, where the bees and the birds went on with their humming and singing, as heedless of the old man as if

he were not asleep but dead—struck her with forcible contrast, and reproached her unconsciously for all she had been thinking of so bitterly.

She had no time to think more; for Mr. Oldham woke, and apologized, in some confusion, for being so discovered.

“But I really do not believe I was asleep, Madame; I was only meditating. At my age one has plenty of time for meditation. You, I suppose, have very little?”

“None at all.” And the idea of her sitting down, only for ten minutes, idle, with a book in her hand, quite amused Mrs. Scanlan.

The old man seemed much pleased to see her; brought her an arm-chair as comfortable as his own, and thanked her warmly for taking such a long, hot walk just to pay him a neighborly visit.

“It is very kind of you; very kind indeed, and you are most welcome too. I am so much alone.”

His courteous gratitude smote her conscience painfully. Coloring, almost with shame, she said at once, blurring it out in a confused way, very unlike her ordinary sweet and stately manner—

“You must not thank me too much, Mr. Oldham, or I shall feel quite a hypocrite. I am afraid my visit to-day was not at all disinterested, in the sense you put it. I had something which I particularly wished to speak to you about.”

“I shall be most happy,” returned the rec-

tor; and then noticing how far from happy his visitor still looked, he added, "My dear lady, make yourself quite at ease. I like your plain speaking, even though it does take down an old man's vanity a little. How could I expect you, a busy mother of a family, to waste your valuable time inquiring after the health of a stupid old bachelor like me?"

"Have you been ill? I did not know."

"Nobody did, except Waters; I hate to be gossiped about, as you are aware. I think, Mrs. Scanlan, you and I understand one another pretty well by this time?"

"I hope so," she said, smiling; and taking the hint asked no more questions about his illness. She noticed that he looked a little worn, and his hands were "shaky," but he was as polite and kind as usual—rather more so, indeed.

"Come, then, we will sit and talk here, and afterward we will go and look at my roses. I have the finest *Banksia* you ever saw, just coming into flower."

Banksia roses! and the bitter business that she had to speak about! It was a hard contrast for the curate's wife; but she made a violent effort, and began. Once begun it was less difficult to get through with; the rector helping her by his perfect yet courteous silence; never interrupting her by word or look till she had got to the end of her tale, and had made, in as brief language as she could put it, her humiliating request. Then he raised his eyes and looked at her—inquiringly, as it seemed, but satisfied; looked away again—and sat drawing patterns on the gravel-walk with his stick.

"What you tell me, Mrs. Scanlan, you probably think I was unacquainted with, but I am not. Your husband has broached the matter to me several times; he did it a week ago, and I gave him an answer—a direct refusal."

"A direct refusal! And he never told me! He allowed me to come and ask you again!"

For a moment Josephine's indignation had got the better of her prudence.

"I beg your pardon, Mr. Oldham," added she, rising at once. "I perceive I ought not to have come here at all. But Mr. Scanlan said—"

She stopped. It was not always safe to repeat what Mr. Scanlan said, without some confirmatory or secondary evidence.

"Mr. Scanlan probably said a great many unnecessary things, as a man does when he is annoyed—and I fear I annoyed him very much that day. But you must pardon me, Madame. Your husband is a young man, and he ought to put up a little with an old man like me. So ought you. My dear lady, will you not sit down again, and let us talk the matter quietly over?"

She obeyed, though it went against her grain sorely. But the rector was, as he said, an old man, who had been very kind to her and her children. She believed him to be really her friend—in fact, the only friend she had. Since forlorn wives, whom the world supposes well

protected, are, consequently, the most friendless women alive. Their one stay failing them, they can have no substitute; they must acquire strength enough to stand alone—or drop.

"Mr. Scanlan told me, of course, of the alternative—the fatal alternative, for me" (here it was difficult to distinguish whether Mr. Oldham meant truth or satire)—"that if his income were not increased he would have to go at once to reside in London. It seems he has admirable prospects there?"

This last sentence, which, though stated as a fact, sounded more like a query, was met by Mrs. Scanlan with a dead silence. In truth, she was so surprised at finding all these things, upon which her husband had bound her to secrecy, made patent by him to the very last person she expected he would have told them to, that she could not find a word to say.

"Or else," pursued Mr. Oldham, "he thinks he has great prospects—which, in a person of my friend Scanlan's enthusiastic temperament, comes to the same thing. But in such important matters I always prefer having the lady's opinion likewise. What do you say? Is it your wish to leave Ditchley?"

"No. Decidedly no."

The old man looked pleased. "I am glad of that. I should be sorry, Madame, that after all these years you liked us so little that you were glad to run away. And, besides, I can not feel that there are such vital objections to Ditchley. It is a pretty neighborhood, with good society, a healthy place for children, and all that. Why should you go to London?"

"My husband wishes it."

"Yes, I remember he said he would be better appreciated there; would attract large congregations; get into the aristocratic evangelical set, and so on. He might; he is a clever man, and a most—ahem!—most popular preacher. But, at the same time, he might not. As I told him, it is just a chance; and if the chance fails, where is he? Also, where are you and the children?"

Mr. Oldham spoke in such a practical, kindly, common-sense way, having evidently taken in the position and thought it over, in a way that people seldom trouble themselves to think over their friends' affairs, that Mrs. Scanlan was a little relieved. He had not been offended, evidently, whatever unpleasant talk had passed between him and her husband. She felt extremely grateful to the old man, and expressed her gratitude warmly.

"No, no. You have nothing to thank me for; it is quite the other way. And I looked forward to having the pleasure of your society, and my friend Scanlan's, for some years—in fact, till my years are done. It would be a great regret to me if you had to leave Ditchley."

"And to me also. In which," added she, recollecting herself, "I am sure my husband would join. He would hesitate very much at giving up his curacy. But necessity has no law." For it seemed as if the object of her

visit were slipping away, so she forcibly brought herself back to the point. "It all comes to this, Mr. Oldham: we can not live upon the income we have from you, and we have no other—not a half-penny but what you give us."

"Indeed? I feared so, but I never was quite sure of it. You must have a sore pull sometimes. Poor lady!"

He just touched her hand, with which she had grasped the arm of his chair. What a thin hand it was! and marked with traces of toil, not usually seen on a lady's hand. Mrs. Scanlan drew it away at once.

"I do not complain," she said, rather proudly. "I shall make ends meet, if I can, but just this year I have been unable to do it, and I feel quite miserable. Do you know we actually owe fifteen pounds!"

"Fifteen pounds—what an alarming sum!" said the rector, smiling.

"Not to you, perhaps; but to me it is alarming. It makes me shrink from going through Ditchley High Street. I think all men's eyes must be upon me. 'There is the clergyman's wife; she owes money, and she can't pay, or won't pay;' for how do they know which it is? Oh! Mr. Oldham, you may think lightly of it, but to me it is dreadful—intolerable!"

She spoke earnestly; almost with the tears in her eyes. It was so long since her heart had been opened to any body, that once beginning to speak she could not stop herself.

"You see, I never was used to this sort of thing. My father—ah! if you had known my father! He would have gone hungry—many a time we have both gone hungry—but to go into debt! we would have shuddered at such a thing. Yes, you should have known my father," she repeated, and her tears began to start.

"I have never named the circumstance to you, Madame, because it was not necessary," said Mr. Oldham, gently; "but once in Paris, at the marriage of Mademoiselle his sister, whom I had met before and much admired, I had the honor of seeing, for five minutes only, Monsieur le Vicomte de Bougainville."

Greatly astonished, but still unwilling to put questions which Mr. Oldham had evidently no intention of answering—indeed he seemed exceedingly to dislike the subject—Mrs. Scanlan sat silent; and the next moment the butler appeared, announcing lunch.

"You will allow me?" said the rector, offering her his arm. "After luncheon we shall have an opportunity of talking our little business over."

The curate's wife roused herself to necessary courtesy, and her courage, which had been slowly ebbing away, faintly revived. During the meal she and Mr. Oldham conversed together in their usual pleasant way; on his favorite hobbies, his garden and so on; nay, he paid her every attention that he could think of; even sending for a bottle of his most precious Burgundy, in celebration, he said, of the rare honor of hav-

ing her for his guest. His kindness comforted her even more than his wine.

Besides—alas for poor mortality!—to her, faint from her hot walk, this plentiful meal, more luxurious than any dinner she had had for months; and the peaceful eating of it, surrounded by the quiet atmosphere of wealthy ease, affected her with a sensation of unaccustomed pleasantness. She had never cared for luxuries when she had them; but now, in her long lack of them, they seemed to have acquired an adventitious value. She almost wished she had a beggar's wallet, and a beggar's cool effrontery, that she might take a portion of the delicately-cooked dinner home to her children, especially her sickly Adrienne; and she gazed round the large, cool, airy dining-room with an unconscious sigh.

"You seem to admire this room," said Mr. Oldham, smiling.

"Yes, I always did, you know. The Rectory is, to my mind, the prettiest house in Ditchley. And I have a weakness for all pretty things."

"So have I. And sometimes I think I might indulge it even more than I do—in collecting pictures, for instance. But where would be the good of this—to an old bachelor like me, who can not, at best, enjoy them long? and at my death they would be all dispersed. No, no; I have made up my mind to keep to my old plain ways, and leave extravagance for those that will come after me."

It was the first time Mr. Oldham had ever openly reverted to his heir or heirs. Of course they existed: rich men have always a tribe of seventeenth cousins and so on, eager to drop in for what may be left them; but none such had ever appeared at Ditchley. The town and neighborhood seemed as ignorant on the subject as Mrs. Scanlan; in fact, the general opinion was that Mr. Oldham meant to leave all his money to some charitable institution. He was, she knew, the last of his family—a sad thing in itself, and not a pleasant topic to speak upon with him; so she tried to turn the current of conversation by some commonplace remark, hoping that "those which came after him" would long be kept out of their inheritance.

"Thank you. However, when they do come into it they will find it safe and sure. I take a good while to make up my mind, but having once made it up I rarely change it. My heirs may count securely upon their property."

It was an odd remark, and Josephine was puzzled how to reply to it. Of course, it showed Mr. Oldham's friendly spirit toward herself and her interest in his affairs thus to speak of them to her; but her own business was too near her heart, and she was pardonably indifferent as to who might or might not inherit Mr. Oldham's money. The humble fortunes of herself and her family were of much more importance to her just then. Still, she would not force the conversation; but she waited with nervous impatience for her host to quit the dining-room and lead the way into his study.

He did so at length; though even when there he settled himself in his chair, and pointed to her to take another, without testifying any immediate intention of beginning the subject which lay so close to her heart.

"Do you ever think of dying, Mrs. Scanlan?"

It was an odd question, odd even to ludicrousness; but she restrained her inclination to see it in that light, and said, gravely:

"In a religious point of view, do you mean, Mr. Oldham?"

"No; a worldly one. Do you consider yourself likely to have a long life?"

"My family were all long-lived, and I am myself, so far as I know, a very healthy person. Yes; I hope I shall live to see all my children grown up. God grant it!"

She slightly sighed. For, when in her last crisis of motherhood she had a nearer risk of her life than ordinary, it had struck her—what if she were to die, leaving those poor little ones of hers with no shelter, no protection against the hard world, except their father? And since that time she had taken especial care of her own health, and striven hard against a weary longing for rest that sometimes came over her, praying that she might be forgiven for it, and not allowed to die until she was quite an old woman, or until her children needed her no more.

"My life is in God's hands," she resumed, "but, humanly speaking, I see no reason why it should not be a long one. I trust it will be, for my children's sake and my husband's."

"Your husband is less strong than you; at least he always tells me so. When he gets into a melancholy mood he says he shall never live to be my age."

"I think he will, though," replied Mrs. Scanlan, cheerfully, "especially if he has no very hard work, and resides always in the country. Which is one of my strong reasons for disliking to remove to London."

"Stay; we will enter upon that matter presently. Just now I wish to speak to you about—what I did not at first mean to tell you, but have decided that it is better I should—some private affairs of my own. A secret, in short. I know that you can keep a secret."

Mrs. Scanlan bent her head assentingly, wondering what on earth was coming next. Surely, she thought, it is not possible that the old man is going to be married! He was seventy-five at least; yet such things do happen, even to septuagenarians. But his next sentence removed this doubt.

"It is a secret that you will have to keep for some time—possibly several years. And you must keep it implicitly and entirely. You must not even tell it to your husband."

"Not tell my husband!" cried Josephine, drawing back. "Then, I think, Mr. Oldham, you had better not confide it to me at all. It is exceedingly difficult—not to enter upon the question of whether it is right or wrong—for any wife to keep a secret from her husband."

"May be; I have never had the advantage of being married, and am certainly not likely now to risk the experiment. But still, in the matter of Mrs. Waters you did not tell your husband."

"That was different," said she, hesitating.

"Nevertheless, here the case stands. Either you must promise not to communicate this fact to your husband, or I can not confide it to you. And it is important—indeed, of the most vital importance—that you should know it."

The rector spoke decidedly, with that decision which, whenever he chose to exercise it, she was aware was inflexible. He did not care to fight about small things, but in great ones, when his mind was made up, you might as well attempt to move a mountain as Mr. Oldham.

"It is a secret," continued he, "which is exclusively mine; which would do Scanlan no good to learn, and might do him considerable harm. The greatest kindness I can show him, I honestly believe, is to keep it from him."

"Then why tell it to me?"

"Because you are another sort of a person. It could not possibly harm you, and might be useful to you in some degree—you and the children. I advise you to hear it, if only for the sake of the children."

"I hate mysteries," said Mrs. Scanlan, uneasily, and turning over in her mind what this secret of the rector's could possibly be. Was it any difficulty between him and his bishop, in which Mr. Scanlan was also concerned? Or was it—this suggestion occurred to her as most probable—something relating to Mr. Scanlan's future; perhaps his chance of the next presentation to the living of Ditchley, on Mr. Oldham's decease? The rector's next words confirmed her in this idea.

"I hate mysteries, too, Madame, unless they are quite unavoidable, as this is. I ask from you a plain Yes or No, nor can I give you any more information to influence you on the matter, except that when you know my secret, I believe, I am almost sure, that you will not think it necessary to go and live in London."

The temptation was sore. "Oh! Mr. Oldham," she said, piteously, "why do you try me so hard?"

"I do it for your own good. Do you think I don't feel for you, my poor girl?" and his tone was almost paternal in its kindness. "But the circumstances of the case are quite inevitable. Either you must accept my secret, and keep it from your husband, and from every human being during my lifetime, or I shall consider the conditions void; and all things shall be as if they had never been."

"I do not understand—"

"There is no necessity that you should understand. Only, will you trust me? Have I not always been a good friend to you? Can you not believe that I shall remain so to the last? And I give you my honor—the honor of the last of the Oldhams"—added he, with a sort of proud pathos, that went right to the

heart of this mother of a rising race, "that what I ask of you will never trouble you, or grieve you, or compromise you in the smallest degree. It is *my* secret. I might have kept it from you to the last, only," with an air of amused benevolence, "I think you will be the better for hearing it. I think, too, that Scanlan himself would urge you to accept my conditions—if he knew."

"Let me tell him," pleaded the wife. "Let me just tell my husband that there is a secret; which he must allow me to keep, even from himself, for the present."

Mr. Oldham shook his head. "You Quixotic woman! You are like Charity, that 'believeth all things, hopeth all things.' But I know better. No, no. Don't mistake me. I like Scanlan very much. He is a clever fellow; a pleasant fellow; he suits me as a curate. I never wish to part from him. Still, my dear lady, you do not require me to tell you that—that—" he hesitated—"Mrs. Scanlan is a very superior person to her husband."

Poor Mr. Oldham! in his ignorant bachelorhood he had not a suspicion of the effect his compliment would produce.

The blood rushed violently into Josephine's face; she drew herself up with a haughtiness which he had never before seen.

"Sir!—Mr. Oldham!—you can not surely mean what you are saying. Let us dismiss this subject, and confine ourselves entirely to the matter in hand—the matter my husband sent me to discuss with you. May we enter upon it at once? for I must go home to my children."

Mr. Oldham regarded her a moment, and then held out his hand almost humbly.

"Pardon, Madame. I was forgetting myself, and speaking to you as if you were my daughter. You almost might have been. I was once in love with a lady very like you."

There was a slight twitch in the withered face, and the momentary emotion passed. Who the "lady" was, Mrs. Scanlan did not, of course, ask him. Years afterward she had reason to think it might have been her aunt, that beautiful Mademoiselle Josephine de Bougainville who died young, soon after her marriage, which had been a marriage *de convenance*; but the real facts, buried far back in long forgotten years, Josephine never inquired into and never learned.

"The matter in hand, as you termed it," resumed Mr. Oldham, "is easily settled. I like you—I like your husband. I wish him to remain my curate as long as I live. Therefore, tell me how much income you think necessary for your comfort, and you shall have it. Give me my check-book there, state your sum, and we will arrange the matter at once. And now, may I tell you my secret?"

Mrs. Scanlan had listened in wondering thankfulness, too great for words; but now she recoiled. Evidently the old man was bent upon his point, and upon exacting his conditions to the letter. Her strait was very hard.

The simple duty of a wife—to hide nothing from her husband; to hear nothing that she will require to hide—Josephine never doubted for a moment; but hers was an exceptional case.

She knew well enough, and was convinced the rector knew, that Edward Scanlan was the last man in the world to be trusted with a secret. At least, so she should have said of him had he been any other man than her husband; and did his being her husband alter the facts of the case, or her judgment upon it? We may be silent concerning the weak points of our nearest and dearest; but to ignore them, to be willfully blind to them, to refuse to guard against them, is, to any prudent and conscientiously-minded person, clearly impossible.

Could it be that in refusing the rector's conditions, which her judgment told her he, who knew her husband's character as well as she did, was warranted in exacting, she was straining at gnats and swallowing camels? setting up a sham eidolon of wifely duty, and sacrificing to it the interests of her whole family, including her husband's?

"Are you sure it will never harm him—that he will never blame me for doing this?"

"Scanlan blame you?—oh no! Quite impossible," answered the rector, with a slight curl of the lip. "I assure you, you may quiet all apprehensions on that score. He will consider it the best thing you could possibly do for him."

Yet still poor Josephine hesitated. That clear sense of the right, which had always burned in her heart with a steady flame, seemed flickering to and fro, turned and twisted by side winds of expediency. The motto of the De Bougainville family, "*Fais ce que tu dois, advienne que pourra*," rung in her ears with a mocking iteration. In her girlhood she had obeyed it always—had dared every thing, doubted nothing. Could wifehood and motherhood have made her less honorable, less brave?

"Come," said Mr. Oldham, "this is too important a matter for you to give, or me to take, a rash answer. There is a blank check, fill it up as you think fair. And meantime go into the garden and look at my roses, just for a quarter of an hour."

With gentle force he led her to the French window of his study, handed her through, and closed it behind her, shutting her out alone in the sunshiny garden.

Therein she wandered about for fully the prescribed time. What inward struggle she went through, who can know? Whether she was able to satisfy herself that she was doing right; that circumstances justified what, in most other women's case, would actually be wrong, and she would have been the first to pronounce wrong, who can tell? Or, perhaps, goaded on by the necessities of her hard lot, she deliberately set aside the question of whether her act was right or wrong, and was determined to do it—for her children's sake. If any thing could turn a woman into a thief, a murderess, a sinner of

MRS. SCANLAN'S SCRUPLES.

any sort, I think it would be for the love of, or the terror for, her children.

I do not plead for Josephine Scanlan. I only pity her. And I feel—ay, I feel it even with my own husband's honest eyes looking into mine—that, had my lot been hers, I should have acted exactly the same.

She came back to Mr. Oldham.

"Well, my dear lady, have you decided?"

"Yes. You may tell me any thing you like, and so long as you live I will keep your secret faithfully."

"As you did Mrs. Waters's?"

"That was a different matter; but I will keep your secret too, even from my husband."

"Thank you." And Mr. Oldham shook her hand warmly. "You shall never regret the— the sacrifice."

But now that he had her promise, he seemed in no hurry to claim it. He finished writing out the check, putting in a sum a little beyond that which she had named, and then, taking up his hat and stick, composedly accompanied her round the garden, pointing out his favorite flowers and his various improvements.

"That Banksia rose, is it not fine? I shall

train it all over the veranda. Indeed, I have thought of making a proper rosary, or rosarium; but it would be expensive, and is hardly worth while, since the Rectory comes into other hands at my death. Oldham Court, however, will be the property of my successor—and a very fine property it is—quite unencumbered. My heirs might run through it in no time; however, I shall take care to prevent that. My friend and executor, Dr. Waters, and my lawyer, are both remarkably acute, firm, and honorable men."

"Oh! yes," replied poor Josephine, answering at random, for her patience was at its last gasp. But still Mr. Oldham went on talking—she scarcely heard what—about every thing except the important secret; and not until the very last minute, when he had let her out at the gate and stood leaning against it, still conversing with her, and regarding her in a tender, wistful sort of way, did he refer to what he had to tell.

"I am laying on you a heavy burden, you think, Mrs. Scanlan? Perhaps it is so. But be easy; you may not have to bear it very long. Only during my lifetime."

"That may be, I trust, many years."

"And, possibly, not one year. I had a slight seizure the other day, which made me arrange all my affairs. But do not speak of this. It is of no consequence. Go home now, and mind, what I have to tell you must make no difference there; every thing must go on as heretofore. Only you need not come to me again, looking the picture of despair, as you did to-day."

"Well, I do not return in despair, thanks to your kindness. And on my next visit I will take care to put on my best looks, and bring a child or two with me, to amuse myself and you. Shall I?"

"Certainly. Yours are charming children, and—" he added, becoming suddenly grave, "do not torment yourself any more about their future; it is not necessary. This is my secret—a very simple one. Yesterday I made my will, and I left you my heiress. Not a word. Adieu!"

He turned, and walked quickly back into his garden. Mrs. Scanlan stood, transfixed with astonishment, at the Rectory gate; and then, there being nothing else left for her to do, she also turned and walked home.

DRAW YOUR CONCLUSIONS.

I.

MR. BELAH BUFFUM was thirty-five, portly, of a comfortable fortune, blue-eyed, in excellent health, a bachelor, argumentative to the last degree, and a *ci-devant* lawyer. The third year after his admission to the bar he left the profession in disgust, and on strictly logical reasons. The judges had a ridiculous fashion of stopping argument by something called a "sentence," just at the moment when Belah Buffum, Esq., was most in the mood of pressing the question to its ultimate bearings. Just as his antagonism was developed to its maturest pitch, down came a crusher on all legitimate reasoning, or, that disregarded, punishment for contempt of court. So, having argued several causes clear up to that jumping-off place, that Montauk Point of legal logic, the Court of Appeals—having offered before the whole eight judges to submit the question which they had decided against him to an enlightened public sentiment, and the judges and public sentiment being both perfectly willing, on the payment of the costs, Mr. Buffum disdainfully leaped from the Montauk aforesaid, and made his final plunge into the ocean of private life. It may be thought that I should confuse the metaphor and say the peaceful lake of private life. But no! to Mr. Buffum the domestic circle was dear only as a maelstrom of seething disputation, and home, sweet home, precious as a place where some one to argue with could always be kept at hand.

In spite of this combatant disposition, his natural goodness of heart was such that Belah Buffum had friends by the dozens—always ready to oblige him by taking the other side in every

thing, because they knew he loved them the better for it—always ready to pitch into him on any subject whatever, from transcendental theology to the new breed of hens.

One of these friends had been a gentleman of the name of Shearsworth, who one day happening to die, prefaced his departure by handing him his will, with the information that he had left him—Buffum—executor and guardian of his only child, Adolphus, who, on certain conditions, was the sole legatee.

At the time this history opens Adolphus Shearsworth was twenty years of age, and had been under the tutelage, as well as at the country residence, of Mr. Buffum for a period of eighteen months. During part of this time he had had a private tutor, and was supposed to be preparing for college. But the tutor being a Scotchman of the most inveterately marked Calvinistic type, as a matter of course made Mr. Buffum a fiery Arminian; so that after a month of agony, with burning ears and his wardrobe in a silk pocket-handkerchief, Mr. M'Crackin fled from what he entitled "*joost an eenfidel hoose*."

After the departure of the tutor Mr. Buffum resolved to take Master Adolphus's education into his own hands. He read Virgil with his ward, managing to pick a quarrel with him on the construction of every line. Even the subject of algebraic roots and geometric angles, by philosophers hitherto regarded the most certain of all themes, was not closed to discussion; for, although Mr. Buffum could not deny that the square upon the hypotenuse is equal to the sum of the squares on the other two sides, he could still wage battle on the ground that there was a vastly better way of proving it than the one in the book.

Now this to Mr. Buffum was a mighty pleasant way of spending his time, but to Adolphus no stupider manner of life could be imagined. Accordingly, one morning, after having fought the simplest bread-and-butter questions for an hour and a half, he took courage to tell Mr. Buffum that he had determined to introduce a change in their routine.

"Mr. Buffum, I'm confoundedly bored by all this argument, this perpetual jabber of discussion from morning till night. I am going to abandon it. Henceforth I throw logic to the dogs; I divert myself from it in every possible way. Among others, I'm about to fall in love."

"Pish! you talk like a fool. Are you crazy?"

"Not yet; though I should be if I endured your logic a little longer. So, on purely emotional grounds, I am going to fall in love as soon as possible."

"Who is the other goose?"

"Be kind enough to moderate your language in speaking of my beautiful Unknown. I should hate to have to fight you before I have found her; and after that I assure you that my time will be too well occupied."

"Do you know that you are talking mad-

ness? Are you not aware that there is but one young woman in the world with whom you can commit that folly and still retain possession of your estate?"

"Do you know that *you* are talking mystery?"

"Have you never read your father's will, Adolphus Shearsworth?"

"Don't you know his commands to me? Didn't he tell you that I was not to read it till I came of age, unless some condition or other, confided only to you, was fulfilled before that time; that until then I was simply to know he had made me sole legatee upon that condition?"

"I knew the condition, of course, but not the command. The silly resolution you have avowed compels me to tell you that condition now. Do you know the Lumleys?"

"I'm aware there is such a family—in Worcester, you mean?"

"Yes, Sir, the very same. During your grandfather's lifetime the Shearsworths possessed all the large landed estate now owned by them. They were his principal creditors. When he died insolvent two cotton-mills in the height of prosperity and five thousand acres of the best land in this State passed into their hands from his executors. The dream of your father's life was the restoration of that property to your family. Its re-purchase was his predominant motive in the accumulation of the fortune whose trustee I am. In his lifetime he was never able to effect his purpose; but with that calm, logical sagacity which marked all his actions he perceived that Charlotte Lumley—at his demise a girl in boarding-school—would necessarily be heiress to the whole estate. The condition, then, affixed to the bequest of his whole fortune to you was, that you should become acquainted with the girl, make love to her, and, if she would have you, *marry* her. If *she* refused you, you were absolved from the condition; if *you* refused to make an effort for her, then all the property of your late honored father was to become *mine*."

"The devil!" ejaculated Adolphus, his black eyes flashing, and his fist clenched tight. "It is intended then to force me into marrying this girl whom I despise?"

"Hoity-toity!—*despise*? A moment ago you would fall in love with a myth—a woman you had never even heard of; and now that I mention one that you have simply never seen, you tell me that you despise her! Irrational, illogical boy! what do you despise in this unknown girl?"

"I despise a tool any where—every where—of whatever sex! I despise a woman who is to be forced down my throat! I despise her because you would defeat my own lawful will by her! Sir! I will never speak to her! I swear it here; and may I die the day I break my oath! I will *never* marry Charlotte Lumley!"

"Dare you tell me that, indeed? Do you remember the penalty entailed upon that oath?"

"Do you mean, Sir, to say that you will

consent to accept my property on such a trivial, paltry, nefarious condition?"

"Why not, Sir? Undoubtedly, Sir! Am I not executor of your father's will—bound to see it fulfilled to the last tittle?"

"And do I understand that after the property escheats to you by such a vilely procured forfeiture you will have the face not to make me at once a deed of full surrender?"

"That kind of thing occurs frequently—in novels—young man. But rational reflection will show you a much shorter cut to your property. You will recall your rash vow, and propose to Charlotte Lumley; then, whether she has you or not, the condition will be fulfilled, and the estate yours. I can delude you with the hope of no other way, Sir."

"Let this be the last time I ever hear that proposal of dishonor from your lips! Very well, Mr. Buffum, oppress the orphan; keep the property, Sir, and much good may it do you!"

"So I will, Sir! So I will—to the last foot of ground—to the last cent of money! Every rational argument is on my side."

"Are you a villain, Mr. Buffum?"

"Draw your conclusions, Master Adolphus."

For a moment the young man looked at his senior as if about to pitch into him bodily; then his old habit of regard for authority got the better of him, and changing the expression of wrath for one of contempt, he turned his back on Mr. Buffum and left the room.

One of his favorite retreats when harassed with protracted spinning in his guardian's domestic maelstrom had always been the house of James the coachman—a cottage on the property of Mr. Buffum, nearly a quarter of a mile from the great house, neatly kept by a tidy wife, who also acted as dairy-woman of the estate, and a veritable Lotus Bay to any who might seek repose from premise and conclusion. For not only could Adolphus there solace himself with emollient fresh cream and pot-cheese, but James and his wife, as themselves would say, were both Irishmen; and where could any body get further out of the atmosphere of logic than in such society as that? Intending therefore to divert his mind and cool his fever by an hour's gossip with the two good-natured Paddywhacks, and a comfortable pull at his cutty as he sat at the porch in their best hickory-bottomed easy-chair, Adolphus now threw himself with angry but gradually moderating strides toward the coachman's cottage. Just as he entered the house by the front-door he was sure he saw a pretty face and figure slip out of the back one. In all the world there is no such fascinating introduction to a woman as that!

He was sure she had not gone far. He felt that exhilarating palpitation of heart, that delicate titillation of brain, which assures a young man that his suspicions are correct—that the charming creature is peeping through the blinds or watching in the shrubbery.

He found James nursing a sore finger, torn on a nail in the cow-house, in muslin swathings ample for the envelope of any reasonably sized baby—"quite kilt" by his wound, as his nation are wont to be at every affliction, from a death in the family to corns—but solacing his woe in a manner equally national with something red which his wife had mixed him in a tumbler, and, for a "kilt" person, beginning to feel pretty resigned.

After imparting his friendly condolence, not only by words but in the more expressive mode of slipping a dollar into Maggie's hand "to get something to make James comfortable," he feigned to depart, then turned on his heel and made the casual inquiry:

"Oh, by-the-way, can you tell me the name of the old lady who slipped out of the back-door just as I came in?"

"Hivin bless yer kind heart, Misther Adolphus!" cried Maggie. "Ay, an' open yer eyes too, if ye can't till the difference, at your time o' life, God bliss me, betwane an ould woman and the prettiest girl in all Cobble County!"

"You don't mean to say that the person who went out of this house as I came in was a pretty young girl?"

"Faix an' I do that! It was Miss Lotty Burrill, and her father owns the farm next Mr. Buffum's—only he's dead now, poor sowl—sorra for him!—and she and the mother are left alone to tind it. Bad work they make of it indade; and no wonder, for it's not asy to manage thim farm-hands when there's a man to do it, let alone a pair of sorrowful women!"

"Has Miss Burrill gone home?"

"Troth and that's more than I can say, Sir. As soon as James kilt his finger in the cow-house I ran across the field to get her—for she has a wonderful knowledge o' dotherin', and many's the time she's been good to us alridy. But as soon as she heard a gintleman at the dhoor she went out like a young deer—for she's shy of strangers—and she said she'd walk in the garden a bit till you was gone."

"Well, Maggie, I want to thank her for taking such good care of you and James. Suppose you just call her in and introduce me."

"Very well, Misther Adolphus." Maggie opened the back-door and called:

"Miss Lotty! Miss *Lotty*! Darlint, can ye be afther givin' one lasht luk at James's finger before you go back to the mother?"

From the length of time which elapsed before any answer was returned, it seems unquestionable that Miss Lotty must have been at some very distant portion of the premises, where looking in at the blinds was absolutely impossible.

At last, however, the young lady came in. Without the slightest idea that any body was present save her Irish protégés, and with cheeks flushed by her late exercise in the garden, she tripped up to examine that dolorous bale of unbleached muslin, James's finger; then, with the

prettiest little air of trepidation and surprise, catching sight of Adolphus, made a half step back toward the door again.

"Miss Burrill," said Maggie, with frank brevity, "this is Misther Adolphus that I've tould ye of so often."

The young lady bowed modestly, and amended Maggie's nomenclature by murmuring, "Mr. Shearsworth."

"I could not bear to leave the house, Miss Burrill," said Adolphus, "without expressing the gratitude felt by myself (and I am sure I may speak for Mr. Buffum too) for your repeated acts of kindness to these favorite family servants."

"Pray don't mention it, Sir. The little I can do for them is a great pleasure to me."

"Indeed I don't doubt that; I can easily believe that kindness is your favorite luxury; but it none the less demands an acknowledgment. I have been for some time intending to make a call upon Mrs. Burrill and yourself for that purpose as well as neighborly courtesy. But you know that business is the order of the day at Mr. Buffum's, and until now I have been detained, very much against my wishes, I can assure you. May I have the happiness of walking home with you, and being introduced to your mother this morning?"

The young lady assented with a blush of innocent pleasure; and as the two went out of James Kilpatrick's door together that patient sufferer gave Maggie a knowing wink out of the tail of his eye, and pointed at them with the invalid finger. An artist of the High Ideal school would have chosen a different representative for the finger of Fate—might probably have preferred for his material bronze or marble to a roll of unbleached muslin; but Fate is no respecter of high art schools, and the finger could not have been more significant, more prophetic.

The young lady who had accepted Adolphus's convoy was a clear rosy brunette of eighteen, with those great soft brown eyes which lure a man of his temperament as far into good or evil as any human motive can take him. If with those eyes she had possessed a nose the least bit *retroussé*, she would have been the wickedest of coquettes; the most fiery of jealous sweet-hearts that a young man could peril his peace with, had that nose been keenly aquiline. It was neither of these, but our American improvement on the Grecian, straight as Aspasia's, but with a more spirited, more generous nostril, defined from the brow more clearly—our New World feminine nose of character and common-sense.

All this description (some one may grumble) lavished on the nose of a young country girl! But nay, my friend, any nose that is a nose at all is worth it; for that feature is a most wonderful index of nature, despite all the poets who have given it such a gingerly go-by. Add to these details a beautiful mouth—beautiful, though as far as possible from those on the outside of French perfume-boxes, or pouted

in everlasting silliness throughout the "*Beau Monde*" and the "*Galerie pour Rire*." Not its least loveliness to Adolphus—and the impression grew upon him—was that it looked as if it never had been, never could be, the gateway of logic. As they went toward Mrs. Burrill's, and the first timidity of the interview wore away, he saw plainly that she was a girl who talked from her womanly heart; and, being pure and unselfish, who was always intuitively right in her perception of the regions where she ventured. Scarcely had they traveled a furlong of fresh, green meadow-land together when Adolphus said, in confidence with his own bosom:

"This is the girl I *will* fall in love with!"

A little path, wandering through the clover without any logical argument for its course, brought the two up to the house and Mrs. Burrill.

"Mr. Shearsworth, mother. We found each other at James Kilpatrick's, and I invited him over to take breakfast with us. I know he'll excuse our family arrangements if he's as hungry as I am."

Adolphus started. In his altercation with Mr. Buffum he had forgotten breakfast entirely, but his new friends put him at his ease in a moment.

"Breakfast has been waiting an hour," said Mrs. Burrill, as soon as she had welcomed her guest. "Let us sit down directly. Eliza, you may begin to fry the cakes."

Adolphus forthwith took his seat between the mother and daughter at a cozy little round table covered with spotless linen, and felt as if he was about breakfasting with the gods. There was coffee, with no arguments upon the subject either of its adulteration or probable effect in producing degeneracy of the human species; crisp pork fried in batter, and not a sign of any disquisition upon the Levitical statutes against the pig; rice-cakes, without the seasoning of a debate upon the slave labor which produced their basis. Oh, this was heaven! A clean motherly face in a clean motherly cap on one side, and Lotty Burrill's on the other!

It was delightful to be asked how Mr. Buffum's stock was doing; if the new Scotch cows gave as much milk as the Alderneys; how the cross between the Berkshire and the Chinese pigs turned out; and if there was any prospect of the sorghum's succeeding. Mr. Buffum had prize-cattle; but he had always forgotten their horns when talking with Adolphus in his anxiety to get him on those of a dilemma. He had pigs; but whether they rooted satisfactorily or not was of far less consequence with him than the root of the discussion. He had planted several acres with the Chinese sugar-cane; but instead of interesting Adolphus in his saccharine projects, he had continually directed his attention to the Attic salt.

Now that Adolphus could sit quietly over a good breakfast and enjoy that amicable conversation without debate, for which he was still

hungrier, a profound peace, as the Germans say, settled into his soul; and the thought of guardian Buffum fuming over his lonely coffee without a creature to squabble with never once entered his head. Oh! it was an ambrosial breakfast!

The meal being over, how could he resist Lotty's invitation to the barn, to look at the motherless lamb she was nursing? And after he had patted the little creature and admired it to her heart's content (or its mistress through it, their fingers meeting accidentally in the soft wool), what logical motive could prevent his beholding her garden—the violets which might be plucked to put in her glossy hair, the heliotropes which she could stick in his button-hole, blushing when he said, "Don't you know they mean devotion?" feigning to pull them out again; but finally, on his earnest entreaty, granting him permission to keep them there.

And at last, when he felt that he really must go; that it was high noon, and Mr. Buffum would be wondering what had become of him, why should she not go down to the boundary fence with him, walking slowly as if there were no Buffum in the world to wonder? Why, before they parted, should he not venture to rearrange the one violet which had dropped, as they went, from its place in her silken braids? And why should she not say that really it seemed to her as if they had been children together?

Then he leaped the fence and walked home, scarce daring to look over his shoulder lest their eyes should meet, yet unwilling to go without one last lingering glance at her, and again repeating to his heart that earlier imparted confidence: "*This is the girl whom I will fall in love with!*"

"Well, Sir!" was the salutation with which Mr. Buffum met him on the piazza. "What reason have you to plead for staying away from breakfast?"

"None," replied Adolphus, with especial coldness, "save that for once I have been so fortunate as to breakfast without reasons."

II.

For the next few weeks Mr. Buffum daily grew more and more desolate; he had not been so unhappy since the day when he found that you can not argue as much as you want to even in a lawsuit. For now he could not argue at all. Adolphus Shearsworth never vouchsafed a syllable more to him than was required by absolute necessity, and spent most of his time out of the house—Mr. Buffum knew not where—without the slightest pretense of accounting for his absence. How many thousand times did he wish from the bottom of his heart that Charlotte Lumley were at Halifax; that old Shearsworth had had any other topic on earth to think of in that solemn hour when he made his final testament. But he had taken his ground with Adolphus—he could not back down without confessing himself defendant in error, the mere

thought of which made him yellow with chagrin. His pride he might have overcome, for he loved the boy; but, oh, his idolized logic! The thing was rational!—incontrovertible!—irrefutable! He must carry out the commands of his testator! He had no option! There! He was right! He knew he was!

Under any other circumstances Adolphus would have been equally miserable. He was a youth of warm and generous impulses, and had acquired a sincere affection for his guardian. Mr. Buffum, when his ward's back was turned, often looked on him with a sigh. "Poor boy, how dreadfully this trouble will prey upon his mind! I'm afraid he'll go into a consumption."

But, as usual, Adolphus defied all the logical processes, and showed no signs either of consumption or wear. He exhibited a sustained frigidity of demeanor which would have made his fortune if any railway company which pays no dividends could have put him inside its office rail to answer the stockholders' questions. His cheeks wore a healthier bloom, his eyes a clearer brightness, than Mr. Buffum had seen there since his ward entered Aristotle Cottage. Thus the guardian's premises "fell down and broke their crown," and his conclusions, like Gill, "came tumbling after." Thus he became still more piqued, still more determined not to bate one tittle of his determination. Thus these two of the most excellent people in the world made admirable progress in the familiar art of misunderstanding each other.

The source from which Adolphus drew his cheerfulness was quite out of sight of Mr. Buffum. He knew the Burrills only by name, and had never discovered any rational argument for going to see them. He merely felt that, being women, they were wholly illogical, incapable of fair discussion, and so altogether unprofitable to a man with his serious purposes in existence. Meanwhile Adolphus was paying daily, sometimes *bi-* (or even *tri-*) diurnal visits to these unprofitable folk; and at every interview becoming more convinced that his own end in life was not Logic but Love.

As for the Burrills, they saw in Adolphus a young man whose age entitled him to judge for himself. That less than another year of tutelage intervened between him and his entrance on his property was but a trivial consideration to the mind of Mrs. Burrill; and if any body had asked Lotty whether it would not be unprincipled to fall in love with a young man personally worthy of that distinction prior to obtaining the permission of his guardian, she would have looked through the inquirer with those clear brown eyes of hers, and blown away the conventional fallacy which constitutes the plot of half the British plays and novels with such a healthy laugh as must have taken the logic even out of Mr. Buffum. Fortunately, however, both mother and daughter had acquired such a personal attachment for Adolphus that any question whatever relating to his

property was with them a matter of but small moment and infrequent thought. Accordingly, when the first distinct avowal of his love to Lotty made it necessary that he should frankly take them both into his confidence with reference to his father's will and Mr. Buffum's determination, the only alloy to the happiness with which each in her proper way welcomed him into the family was the true feminine indignation with which they sympathized against his guardian's cruelty and baseness.

III.

The morning after Adolphus's fate was decided the frigidity which for the last few weeks had characterized breakfasts at Aristotle Cottage was thawed as abruptly as if Vesuvius had suddenly broken up through the bottom of the cellar.

Mr. Buffum sat reading his paper and sipping coffee between paragraphs with the most visible intention of ignoring Adolphus's existence. Adolphus deliberately cracked an egg, salted it, stirred it, and set the glass down—buttered a slice of bread, sweetened and creamed his coffee, cut himself a piece of steak, and spread his napkin on his knees. With each of these acts his manner grew more decided, and reached its stern culmination in the first spontaneous words which he had spoken to his guardian in many days.

"Mr. Buffum!"

"Well, Sir?"

"Some time since we conversed upon the subject of my marriage, in connection with my father's will. How that conversation ended I need not remind you. I think proper, however, that you should not learn from other sources than myself the fact that I am now engaged."

Mr. Buffum's paper dropped from his hands. Pushing the coffee away, he fixed on Adolphus a stare of stupefaction.

"Engaged! Oh, Adolphus! I am sorry if—if—if—I was—I know I was—overstrong in what I said. My poor boy, I really didn't mean to drive you to *that*!"

"*Drive* me? Not you! I think any body who tried that would find himself mistaken in his man!"

"Oh, Adolphus!" groaned Mr. Buffum. "Who is it—the girl, I mean?"

"That is a frank question, but shall be answered as frankly. The *lady* is Miss Lotty Burrill."

"Oh! I am sorry!—I am very sorry!—I swear I am!"

"Why should *you* be sorry? It only adds a couple of hundred thousand to your small estate."

Oh, the goldenness of silence! Could Adolphus only have spared this slant and let his guardian's heart work for him, the last remnant of Mr. Buffum's obstinacy might have melted away in the warmth of his sympathy for youth and helplessness. But this great art

of silence the youth had not learned. Truly speech is silver at the best, often arsenic and vitriol. With all the love of his nature damped down to embers, all its logic wakened into full blaze, Mr. Buffum fiercely retorted:

"Yes, Sir, you are right! I should not be sorry! I should know my rational duty as an executor, and do it without regard to the weakness of human feelings. Yes, and I *will*! You may be sure of that, Sir—I will!"

"So I expected, Mr. Buffum. I am not disappointed in you—not in the least, Sir!"

With that Mr. Buffum once more picked up his newspaper and plunged into the tariff article, while Adolphus coolly entered upon the discussion of his steak, from which the length of this interruption of the happy family's usual reticence had perceptibly subtracted neither heat nor flavor.

Mr. Buffum, however, thought much that he did not say; and immediately after finishing the meal, without warning to Adolphus, set forth for his first neighborly call upon the Burrills. As he went, he one moment told himself that he was a fool for going; the next, that a stern sense of duty, supported by all manner of rational arguments, demanded the visit imperatively. His final resolution, as he mounted the piazza and ran the bell, was to curb his natural tendencies toward argument; and, as Mrs. Burrill was a woman, therefore utterly unable to reason, to take her on the soft side—her affections.

He had expected a rustic reception—a cold sepulchral room, scented with the mouldy hay which protective economy had spread under an ingrain carpet of dazzling red and green, leaf-pattern; hearse plumes of asparagus in mugs on the mantle-piece; a small table, with an accordeon on it, between the windows; and a large one in the middle of the room supporting a basket of dropsical wax Spitzenbergs; and one crimson morocco annual titled "Book of Beauty," in the infancy of mezzotint; a mortally hard-bottomed sofa with a coffin smell in all the ages since it left the upholsterer's undissipated by the wear of any familiar sitting down. On this last contrivance he had anticipated an hour's *tête-à-tête* with an elderly female in tears and rusty bombazine, more gifted in wise saws than syntax, and ready to give up any thing for the sake of peace.

Having planned his method of proceeding on the hypothesis of such a state of things, Mr. Buffum experienced from the start an utter overthrow of all his premeditated arrangements for saying and doing. He was ushered by a respectful family servant into a little gem of a parlor, where woman's tastefulest hand had been inventing and adorning—still better where her presence had *lived* and every where diffused itself like a subtle atmosphere. The easiest of easy-chairs that he had ever sat in received him while the maid went to announce him to her mistress, and this luxurious interval Mr. Buffum anxiously struggled to improve by new-

considering his method of approach. He had not much leisure for this essential task, and had scarcely reformed himself in the one resolution which had not suffered complete *bouleversement*—not to reason with a woman, but take her on her soft side—when Mrs. Burrill entered. Her motherly sweet face, her gentle dignity, her plain cap, and her general air of mild charity, Mr. Buffum at once found quite reassuring.

"I am your next neighbor, Mr. Buffum, Madam," said he, rising with a bow; "a very quiet sort of person—seldom go off my little place to visit any where—must beg pardon for the lateness of this introduction—perhaps, since I come so late, for venturing to introduce myself at all."

"I pray you won't apologize. We, too, are very quiet, and receive few visitors; so few, indeed, that, until yesterday, it quite escaped me that we had never seen you here."

"If an apology were necessary, Madam, it lies in this. I am ardently attached to the son of my deceased friend, Mr. Shearsworth. As you may be aware, I am his guardian, and I have only just come into the possession of certain facts regarding him which concern both yourself and me, I may say, very deeply. You are a mother, Mrs. Burrill?" ("There!" thought the sanguine Buffum, "that *must* fetch her! It's what always fetches them on the stage.")

"I am, Sir."

"You have an only daughter, I believe, Madam?"

"You believe correctly, Mr. Buffum."

"Her interests are, of course, very dear to you. Now, Madam (I am about to impart facts which may not be known to you), suppose that some relative had left your daughter a large property on condition that she married a man, every way honorable and respectable, whom the relative designated in his will?"

"Pray, let me hear your whole case before I answer, Sir."

"And suppose that, in the event of her refusal to receive this gentleman's addresses, the entire property I have mentioned went to another person—a friend of the family—under these circumstances what would you wish your daughter to do?"

"That would depend upon several contingencies. If she wanted the property, and loved the man specified, I would advise her to waive any scruples she might naturally have as to the original striking impropriety of the condition itself, and marry the gentleman as if no such shameful proviso had been tacked on to him."

"But suppose"—(Mr. Buffum began speaking quite loudly and growing very red in the face; then said to himself, "Hang it! he *wouldn't* get mad with an irrational woman")—"that she wished the property, but had no romantic feeling for the man?"

"Permit me to correct your logic," said Mrs. Burrill, in a tone of gentle yet judicial dignity. "In speaking of a 'romantic feeling' we wan-

der from the issue. *Love*, I believe, was the subject in question, and though that involves romance, it is far from being all-comprehended in it. True love has always abundance of romance, but differs decidedly from *mere* romance in many respects. Now we understand each other. Proceed, if you please."

Mr. Buffum almost gasped with surprise. Where *was* that woman's soft side? Talking logic of her own accord, and to *him*?

"Let us say, she doesn't love the man, then!" spoke he, explosively.

"In that case I should not need to advise my daughter, Mr. Buffum. She has been brought up to Christianity and honor. Her natural good sense and womanly pride, moreover, must always save her from the degradation of bestowing her hand where her heart did not accompany it, especially for so base a consideration as money."

"But suppose the testator were her father, and made the conditions from the most rational motives?"

"I should join issue with you, Sir, on the question whether any motive with such an end could be called *rational*. Among civilized nations it is a well-settled principle that even the nearest relationship gives no title to coerce the conscience of a subordinate. But, even did the title exist, the terms of the condition render obedience possible by either of two courses. Since all womanly and Christian honor forbid obedience in the way of accepting the legacy, we come to the final point. She rejects the property. What must she now do? you would say."

"Exactly what I was about to ask," panted Mr. Buffum, with the feeling that he was on trial for his life, and Mrs. Burrill sitting in Oyer and Terminer.

"In that case, if she still wished the property, her proper course would be this: To go frankly to the other conditional legatee, and tell him that she was unable to fulfill the condition. Supposing him really a Christian gentleman, he could not fail to make instant answer that the property was still hers by every principle of natural right and honor; that from the moment it fell to him through her refusal to comply with the foolish and oppressive condition, deeds of release in full awaited her at his hands. If he proved to be no man, but a mere sponge, whose pleasure it was to absorb all his neighbors' moisture, he would refuse to give her her own—swallow up her patrimony; and she would leave him alone, feeling able to pity rather than willing to despise him; leave this sponge alone to feel the draught he had drunk of another's lawful spring fester within him like a fiery acid. Were she weak enough to desire revenge, she might be sure it would never be other than a curse to him. I believe I have met your difficulties, Sir; but what, may I ask, gains me the honor of your selection as an adviser upon such a question? You spoke as if your cause were not altogether a fictitious one.

Is it possible, then, that you mean to give it any personal application?"

Mr. Buffum arose, with his face scarlet, and looked for his hat with as much trepidation as if it were his head he wanted.

"No, ma'am—nothing personal—nothing but—well—I *did* come to speak of a case—of Adolphus, my ward—but—never mind—some other time perhaps—"

"You have sought my advice in regard to Mr. Shearsworth, then?" said Mrs. Burrill, calmly. "So I infer that *his* was the case you supposed. If I am correct in the supposition, take this counsel to your ward. To begin his young life with a crust on his table—a spring of good water outside his door—the hardest toil to occupy the strength of his daytime, the rudest roof to shelter him at night, without a grain of that gold which is so often a curse at the best—which is always so, a thousandfold, if meanly bought with dishonor—thus bid him begin his life—but not without *love*! Tell him this counsel comes from a woman who did all this for her husband—a widow whose husband, while he lived, bore all this for her. Tell him that for this she cherishes his memory as a blessing and a glory beside which all that the gold of the Astors could buy would seem to her like the poorest, meanest dross."

All this time Mr. Buffum had been standing with both hands clinging tightly to his hat-brim, as if it were some stout cast-iron support, to lose which were to fall prostrate. His eyes were fixed on Mrs. Burrill with the steadfast look of fascination; and when, as she concluded, he attempted to speak, the only words to which he was competent were the proper, but not very logically forcible ones:

"Good-morning, Mrs. Burrill."

"Good-morning, Mr. Buffum."

After which Mr. Buffum struck a bee-line for Aristotle Cottage, with the dazed gait of one who walks in a dream.

IV.

Mr. Buffum resolved to make one final effort for poor Adolphus. He cherished a dim recollection of having once in early childhood been sent away to boarding-school for kissing a pretty maid of his step-mother's. He also repeated to himself several times each day, "Absence conquers love," while he spent hours at a stretch in turning over township maps of the Western States and Territories, with a deep look on his face and a pencil in his hand. Adolphus went in and out as before, without noticing him, until Mr. Buffum one morning asked the pleasure of his company in the study.

"Well, Adolphus," began his guardian, as soon as they were seated, "let us forget the past, at least long enough to talk about your future. I am still your lawful protector, and whatever differences we may have as men must not be allowed to interfere with the discharge of my legal duty for your benefit. You are nearly of age, and, for the sake both of your mind and body, you ought to be thinking of

some active business. Thus far you have had a good education; but you say you don't wish to go to college. Now what *would* you like to do? A gentleman ought not to be idle; he should work for his health, for good spirits and contentment, even though it be not necessary to do it for his living."

"Don't make that reservation in my behalf, if you are willing I should respect your sincerity," said Adolphus, in a tone of iced quassia.

With unusual self-restraint Mr. Buffum overlooked the challenge, and continued:

"I have thought you might like to try farming on your own responsibility. On this place of mine you have had good opportunity for the last eighteen months to observe how that business is conducted. I have noticed that your interest in it never flags, and I am so sure you have a good general idea of the subject that I make you this proposition. I have a nice ranche in my eye, situated on the richest of rich Missouri bottom-lands; soil, in fact, one immense muck-heap, ten feet deep, and fifteen hundred acres in area; with a comfortable log-house and a few other simple improvements on it—right on the Mississippi bluffs, and only a mile from the steamboat landing. It's now in the market, at only a slight advance over government prices. Log-house, did I say? No! a good two-story *frame*-house of six rooms—saw the man who owns it only yesterday. Greatest grape country in the world! Now, if you like, I'll make such arrangements that you can pay for it in slow installments, and go out and settle there for a year or so, till you see how you like it. As to our money differences, for the present let them be kept in abeyance. I'll make the first year's payment for you, at any rate, and go your security for the rest."

When he began to speak he had laid the map of the property under Adolphus's eye. As he went on the young man grew more and more interested, and when his guardian had concluded with the question, "Well, what do you say?" he replied, with greater cordiality than he had shown for months, that he would be happy to take the matter into consideration. Mr. Buffum gave him the map for his private perusal, and the two separated.

Adolphus was not with him at supper, and when they met at breakfast the next morning the young man forestalled the question intimated in his guardian's eyes by volunteering the information that he had concluded to accept the proposal.

"How soon will you be ready to go?" asked Mr. Buffum, with a look of great satisfaction.

"This day week," replied Adolphus, "if the farm implements can be procured by that time. Here's a little inventory of what I shall want. You'd better send it right off to Mapes, and have them boxed and shipped directly."

So saying he handed a couple of closely-written foolscap pages to Mr. Buffum. The guardian ran his eye down the list with a face

expressive of no less surprise than pleasure; then, coming to the end, exclaimed:

"Why, I declare, it's quite perfect! What a fellow you are to observe! How the deuce could you have got this up all by yourself? Egad! one would think you'd had the agricultural experience of a lifetime!"

Adolphus vouchsafed no explanation of the completeness with which he had accomplished his inventory, "*all by himself*," for the very simple reason that—well—any very simple reason which may occur to any pretty maid and lad who happen to be looking over this story together, "all by themselves."

Mr. Buffum immediately forwarded the order, as proposed, and wound up the business with a homily upon persevering application as the sure high-road to success, of which, as our young readers may chance to have met with it before, we give no stenographic report in these pages.

The day of their parting came rapidly around. They were shy and reserved with each other till they stood on the platform of the railway station and heard Adolphus's train blow its last whistle.

Mr. Buffum grew very red in the face and moist about the eyes, grasped the youth's hand with a convulsive pressure, and brokenly murmured, "Good-by, dear old boy!"

"Good-by, Mr. Buffum—"

His senior's visage grew still redder. "Oh, hang it! say '*Guardy*' once more, as you used to!" he explosively exclaimed.

"Good-by, *Guardy*," said Adolphus; and the links of the great boa constrictor that pants steam wriggled away with him to the setting sun.

V.

As a place of residence Aristotle Cottage, with its beautiful *ferme ornée*, now became unendurable to Mr. Buffum, who openly compared it to the Syrian Desert, the Catacombs, and St. Simon Stylites his pillar. He could not hide from himself that he sorely missed the young man at every turn.

At length, in despair, he put the premises under his farmer's tutelage, and started for a watering-place. Stopping over a night in New York on his way through, and making inquiries for the summer destination of his particular acquaintance, he found the tide setting full for Long Branch. The Hodges, the Crumbies, the Stansburies, the Vaughans, and that oldest of old Dutch families, the Krullers, were all going to the Mansion House. Already Laird was entertaining the Blowbells; while Miss Jacintha Cropper, sister of the late Mrs. Lumley, had been there a week, accompanied by her orphan charge—the all-important, the fateful, the testamentary, the conditional Charlotte; the vehicle of one immense estate, the axle on which turned another. This, with Mr. Buffum, was decisive. Lumley senior had been his friend, but Charlotte he had not seen since she was a phenomenon in Hünter's piano exercises, wear-

ing pantalets, short frocks, and her hair in two long tails with blue streamers behind. He was curious, for Adolphus's sake, to see what had become of her in the *lathe of Time*; so down he went.

A score of bachelor greetings on the piazza; supper; and then, as it was a hop-night, when the tables were cleared away out of the great *salle à manger*, a return from his tranquilizing cigar along the bluff to look in on the dancers—these ushered in Mr. Buffum's first evening at the Mansion.

As, without any particular acquaintance beside him, he leaned against the door-post, behind him in the darkness rose and fell the ocean, with that mysterious rhythm which bards are forever vainly seeking to set to their music; in front of him a sea of brilliant women vibrated to the tidal influencings of a waltz of Strauss. Of the men I speak not; in that ball-room they were but the slim spars, the black drift, as from some burned ship, floating on billows of blue, green, argentine, and crimson, at the mercy of their wildly-surging partners.

Should he venture in? He, the helpless male, possessed of no special wave to harmonize him with the grand oceanic motion, to roll miserably in the trough between tulle and muslin, to come to grief against the rocky reef of some dining-room pillar, where all the other drift-wood would miserably bump and bruise him, and the laughing waves play distractingly with his corns?

While revolving these thoughts, so proper to every single man who stands on the borders of such a surge, a gorgeous billow of blue grenadine came bounding landward, and cleverly beached her black drift at his very feet. From her mermaid arms it fell into the helplessly collapsed posture peculiar to drift, good society, and hot weather, and began trickling softly to its disengaged billow, drift-like still in all but the sharp freshness of brine. As the gentleman turned his face toward the door, the first thought that struck Mr. Buffum was his marvelous resemblance to Adolphus. At first sight he could almost have imagined that his ward had been playing him a trick, and really stood there *in propria persona*, but another glance convinced him of his error, though the likeness was still astonishing. The next thought that occurred to him was, how singularly out of harmony the young fellow was with his brilliant partner. Not at all the man for her in any respect! So slight, so boyish, so untrained; his youthful exuberance so little chastened by the sager experiences of manhood. And she, so developed, so womanly, so queenly! He had scarcely time to make this reflection when the youth addressed her as Miss Lumley. The word so startled Mr. Buffum that he flushed to the temples, conscious of having mentally tricked and played the traitor to himself. Had a second person suggested to Mr. Buffum the discord which he had just noticed of his own original discrimination, he would have felt compelled to reply, "I

deny it, Sir; I deny it *in toto*! Why not the man for her?—why not the woman for him? Prove it, Sir; I say, *prove* it!" But it is every man's privilege to be as illogical as he pleases with himself. Not hearing it from a second person, Belah Buffum confessed it in the teeth of the last will and testament of Adolphus Shearsworth, senior—confessed that Charlotte Lumley would be indeed ill-mated with Adolphus, junior; and he with her.

In truth she was a royal woman! Erect, and made of curves pliant as a Hebe's; tall and fair, shedding round her the sweet dignity of a Juno; in every motion the woman of highly developed nature, yet in her look, her dress, and every tone of her rich contralto voice, the woman of perfected social art. To all of these things Belah Buffum was as wide awake as the most illogical man.

As yet, neither she nor the very young youth had seen him. And again, through the pressure of the crowd, Mr. Buffum was forced to listen to a conversation not intended for his ears. First, he heard the voice of the youth—Adolphus's voice, but not saying Adolphus's things:

"He is really the laughing-stock of the room. Such a ridiculous figure! If you'll excuse the vulgar proverb, quite like a cat in a strange garret! A grass-cloth coat at a ball! Why, in Heaven's name, must he appear in such an *outré* costume?—for all the world like a well-to-do farmer going out to look after his haying!"

Belah Buffum boiled. The clear voice he was listening for replied:

"Indeed, Mr. Poproy, you gentlemen are sad gossips! If you talk so about each other to the ladies, how do you talk about the ladies to the gentlemen?"

"I assure you we hold them sacred! For myself, I can say that I only breathe in my heart the name of one!"

"That apartment must be much less crowded than your sex manage to keep it generally," replied Miss Lumley, lightly, without the least sign of appropriation. "Your enslavers can not have to stand on a trunk to dress when they don the brilliant tissues of your fancy. Quite unlike the rest of our Long Branch accommodations, Mr. Poproy. But as to the gentleman whom you mention, forgive me if I can't wholly agree with you. For my part, I'm very tired of this black-coat desert—*very*. A little suggestion of grass—if it's only the *soupeçon* we get in the cloth of that name—is a refreshing oasis. But don't you know any of the fine qualities of the man? He is said to be very noble-hearted and very intellectual. How long have you known your friend?"

"My friend? He—the—"

"Pardon me; he is *mine*."

What? She remembered the young fellow who used to sup at her father's in Worcester, and play with those queues of brown hair and blue ribbon as she sat at the piano astonishing all hearers?

In his enthusiasm Belah Buffum let the crowd carry him quite up to Miss Lumley; and as the madly attached youth in dismay fell back a step at beholding the grass-cloth wings of the angel he had but a moment since spoken of so lightly, that unemotional, rational, logical personage caught the beautiful white hand of the heiress with the exclamation:

"Her father's own true daughter! A thousand thanks for not forgetting me. Be sure how very, *very* glad I am to see the woman such a capital fulfillment of the little girl."

"I am very glad to see *you* once more, Mr. Buffum," answered the heiress, shaking his hand cordially. Then, with a graceful self-possession, turning to the spot where her adorer had been, she said, gently, "Let me make you acquainted with my friend, Mr. Poproy—"

Kindly considerate, but vain ruse of woman's tact! The place which once knew Mr. Poproy knew him no more forever—that is to say, for the rest of the season.

And in the next quadrille Beauty danced by the side of a grass-cloth sack.

VI.

We will say nothing further of Mr. Buffum's Long Branch visit than that, instead of staying a day or two, as he had intended, he protracted his sojourn to an entire month; nor any thing concerning the results of that visit beyond the fact that the madly attached Mr. Poproy might be seen for hours at a time with irregular steps pacing the briny beach, or sitting in an arbor with his hat crushed over eyes which looked steadily across the solemn main. Neither do we make any introductory comments upon Mr. Buffum's resolution to visit Adolphus in his new home immediately and suddenly after the termination of his visit at Long Branch. We pass over every incident that might render a guide-book valuable, and disembark with Mr. Buffum from the Mississippi steamer at Numa Pompilius Landing. There, by a curious coincidence, he found Adolphus in readiness to receive the mail, that gentleman having been in the country three months, and therefore among those oldest inhabitants of new regions who get appointed postmaster. The youth was on horseback, but, dismounting and greeting him kindly, bade him sit down on a pile of wood by the landing while he went home after a cart for his baggage and himself. Mr. Buffum would have liked to walk, but Adolphus would not hear of such a thing, and rode post-haste to the house without waiting to listen to his guardian's logic. He had been absent scarcely half an hour when a negro appeared with a cart, and, loading Mr. B. with his baggage upon it, drove away to the ranche.

Mr. Buffum found it situated on a bold bluff overlooking the river. What an astonishing artistic eye the boy possessed! Already he had trained a convolvulus over the low door of the cottage, planted a profusion of Cherokee roses against the walls, and inclosed quite a

neat yard and flourishing garden within a rustic fence. He brought Mr. Buffum into a somewhat plain but exquisitely tidy room, with a sanded floor, on the right-hand side of the entrance, and gave him the best wooden chair, taking his own seat on a stool directly opposite.

"Let me see what sort of a house you've got; I want to go all over it!" exclaimed Mr. Buffum, endeavoring to waive the chair.

"No, not yet," answered Adolphus, firmly. "Rest a while. Business before pleasure. I'll have my man get dinner in a minute, and after that we'll look at the improvements. You have business in your eye, Mr. Buffum. I can see it. Now out with it; get it off your mind and mine; I am really anxious. Let me know exactly what you've come for—extra, of course I mean, to paying me a kind and welcome visit."

"Well, Sir," said Mr. Buffum, checking the combative feeling aroused by the direct personal manner of his ward, "perhaps this time is as good as any. I will not hide from you that one motive of my journey was definitely and for the last time to ask you if you will obey your father's will and propose to Miss Lumley."

So saying, Mr. Buffum sat up straight in his most offensive logical manner, at the same time chuckling in secret to his very boots with the thought that an unparalleled opportunity for doing the magnanimous was close at hand.

Adolphus crossed his legs, rested his elbow on his knee, and looked his guardian full in the face.

"I will not deny," he proceeded to answer, mildly, "that since I came out into this Western wilderness, and have seen its hardships, my notions of life are very much changed. It will please you to hear that I have repented my foolish obstinacy. I now feel perfectly willing to do as you desire. I accept the condition, and am quite ready to unite the Shearsworth and Lumley properties. I will return eastward with you, address the lovely Charlotte, to whose beauty and accomplishments I am now conscious of having done such great injustice, and marry her immediately."

Through all this speech of Adolphus's Mr. Buffum, turning red and pale by turns, had been jerking uneasily on his chair, and the moment his ward concluded jumped up with a haste which sent that piece of furniture spinning behind him.

"You—will—marry—Miss Lumley—immediately—Sir?"

"On the spot, Mr. Buffum," answered Adolphus, with cheerful firmness.

"By Heavens! you will do no such thing! I—I—I—*deny* it, Sir!"

"Why, what in the world do you mean? Are you crazy, Sir?" replied the youth, standing up and surveying his guardian inquiringly, with his arms akimbo.

"*Marry—marry*, Sir? *Crazy*, Sir? What do I *mean*, Sir? How dare you talk of marrying a lady whom you never saw—*on the spot*?"

"Where else should I marry her? Really, your conduct is most inexplicable. Suppose I should tell her that *you*, her father's *old* friend, had made every effort to bring us together; had absolutely bullied me into wooing her; though a rich man himself, had threatened to beggar me if I didn't; and, finally, had come all this fifteen hundred miles for the express purpose of getting my promise to do so—do you imagine that her kind heart (dear girl! I'm already romantically in love with her for it!) would permit her to reject me—*me*, Sir, a man in every way eligible?"

"Good Heavens! The matchless effrontery of the young animal!" groaned Mr. Buffum, dazedly.

"Of course I shall use every inducement in my power. I shall tell her all you have said; the urgent motives you have brought to bear on me; and, with such an influence seconding me, she must be more or less than human not—"

"You shall do no such thing. You can not—will not—shall not—*dare* not tell her—you—"

"Ah! ah! A light breaks in upon my mind! You *wish* me to refuse proposing to her, and would fain pocket my estates yourself! But I see through your treacherous blinds. I *will* propose to her!"

"You shall not!"

"I *will*! I'll sit down and write to her this very day! I'll follow my letter to her feet! I'll lay myself and all I have there. I'll use all *your* entreaties with her! I'll go by the very next boat!"

Belah Buffum sank into the wooden chair again, and silently folded his arms, the picture of Napoleon after the field of Waterloo. Adolphus resolutely continued:

"Yes, Sir; I'll obey my honored father's will! And still more, I'll expose to Miss Lumley—(sweet, *sweet* girl! how I pant to press her to my impassioned bosom!)—the knavery of the man who has practiced on that parent's orphan son! She and all the world shall know how artfully you awakened a young man's opposition to his best interests by your ill-timed coercion, intending all the while that he should be irritated into a course which must leave him penniless and you doubly rich! I shall blazon it, Sir! And in that day you will find your *logic* but a poor defense!"

"Oh! Oh! Adolphus, my *dear* boy, for Heaven's sake be reasonable—be logical. *Hear me—*"

"Penitently confess, then, how you have wronged me, and release all my property forthwith. Confess! sign! seal! deliver!—before the mail goes out, for then it will be too late."

"Adolphus, my *dear* boy, will you listen to a solemn confidence I am about to repose in you?"

"Proceed, Sir, if you have aught to say in extenuation."

With his eyes fixed upon the sanded boards, and all combativeness vanished from his manner, Mr. Buffum tremulously continued:

"After you left me I went down to Long Branch. There, for the first time since her early childhood, I saw *Miss Lumley*. Before I knew it I fell—that is to say, I became attached to her. And—in an hour—when I thought not—of my duties—as executor—of your father's will—I proposed—to her—and was—accepted."

"*What!* Accepted by my testamentary wife?"

"Forgive your true friend—one who made all his previous representations and entreaties to you with the most unselfish sincerity—forgive him when he says—*yes*. She loves me—I love her—and we shall be—married—unless you—make these fearful—disclosures which you have just threatened. But why should you make them? Oh, be rational! Look at it calmly, logically, and—pity me, Adolphus!"

"A pretty man you are to talk of logic and reason! Was it on their scientific principles that you defrauded me of my father's conditional, contingent, testamentary, and lovely daughter-in-law?"

"Adolphus! I am human."

"Glad to hear you acknowledge it for the first time in my life! Well, I am human too, and lean to the side of mercy—as you *didn't* when you swore you'd keep all my property. I'll let you off on one condition. Sign an acknowledgment that Miss Lumley, by accepting you, has put it out of my power to fulfill my father's testament, and an agreement on the day I attain my majority to deliver me my entire patrimony. This may be of no value as a legal instrument; but I shall keep it as my safeguard till I attain my property; and if any opposition on your part occurs to my entrance on the estate, I publish it to the world! Otherwise it remains in close privacy between us, to be burned when the statute of limitations has made my title irrefragable. Will you sign such a paper?"

"Will you sign a counter-promise never to disclose the efforts I have made to enforce your fulfilling the condition of the will?"

"Yes; to be held binding unless you break *yours*."

"Bring the ink and paper, then, Adolphus."

The two instruments were speedily signed, sealed, and exchanged.

"Now," said Adolphus, "let us forget all past differences. Here is my hand. Come and let me show you the improvements."

As they rose the young man gave a long, shrill whistle, which was followed by a pattering of feet on the other side of the partition. He led Mr. Buffum to the further door of the room, threw it open, and said, with a malicious twinkle:

"Enter—*Improvements!*"

There, in the doorway, stood Mrs. Burrill, and a beautiful young woman whom Mr. Buffum had never seen before.

"Bless my soul! Why, *Mrs. Burrill!* And whom have we here besides, Adolphus?"

"You're a logical man; do as you've so often told me to—'Draw your conclusions.'"

"Miss Lottie Burrill?"

"Shrewd guess, and not so far out of the way for three months ago. By the present almanac, however, *wrong*. Mrs. Adolphus Shearsworth, Mr. Buffum."

"*You young rascal!* Married, and without my consent?"

"None of *that*, Sir! Did you seek *mine*? Make friends, and ask no questions."

"My dear Mrs. Adolphus! I am so charmed to meet you that I don't knock your husband down! Well, well! Upon my soul, Adolphus, I can't blame you—not having seen Miss Lumley, I should have done the same myself! No offense to you, Mrs. 'Dolph. You know I've run away with your husband's first wife already!"

"Yes, Mr. Buffum; and the humanity you showed by it does you great honor. We've known of that this good while!" And Mrs. Adolphus took her husband's guardian laughingly by the hand.

"Known it this good while? Why, what do you mean by that?"

"Just what she says," answered Adolphus. "You don't happen to enjoy the acquaintance of a person named Poproy, do you?"

"I've met him," replied Mr. B., dryly.

"He was an old schoolmate of mine before I went to Aristotle Cottage. When you wrote me you were going to Long Branch, and expected to see Miss Lumley there, I remembered that his family always summered at Laird's, and wrote him, asking to be kept informed of your movements. Fancy my astonishment when a letter came announcing the authentic watering-place rumor that you are the accepted lover of Miss Lumley! I got ready for you, you may be sure!"

"Oh, the young dog!" ejaculated Mr. Belah Buffum.

"Oh no! For Miss Lumley's sake you can afford to be very generous to poor little Poppy! And now, wife and mother, let's take Guardy in to dinner!"

In the visits which one of Missouri's wealthiest and most influential young planters makes yearly to Aristotle Cottage, with his wife, mother-in-law, and a youth in dimity bibs, baptized "Buffum Lumley," the three women become all the more intimate friends as they laugh over with each other their once so complicated relations. As for the men, they are more than brothers. It is a standing joke, at the dinners which celebrate those happy reunions, for somebody to ask B. B. which, from the human and emotional point of view, he prefers—Love or Logic; and it is said that he invariably waves his hand at the beautiful woman sitting opposite him, and, although not so dogmatic as we found him in our earlier chapters, replies, in logical terms, "Draw your Conclusions!"

THE GRAVES AT NEWPORT.

THERE is a "testimony of the rocks," besides that which appeals to artist and geologist, of which the thoughtful wanderer along the deserted highways and quiet fields of Newport, late in the autumn, becomes aware. Those neglected landmarks of the past—the grave-stones—encountered so often in private domains and in lonely church-yards, in the stillness and solitude of the dying but radiant year, acquire a new emphasis and lure the memory and imagination into the realm of the departed; their worn inscriptions, names, dates, and tributary legends appealing to historical associations, local memory, and humane sentiment.

Perhaps a ramble among the graves of Newport will be found to inspire significant recollections and reward a sympathetic survey; for no portion of New England abounds with more varied and interesting elements of character and history, of which mortuary relics are often the chief memorials.

The most remote of these relics of the dead are the Indian mounds, few of which are now discoverable; yet, within a few years, one was opened on the other side of the bay, and revealed many curious historical vestiges, among them numerous utensils of Dutch manufacture, indicative of the aboriginal trade with Manhattan, when the Narragansets exchanged their peltry with the New Amsterdam burghers for pipes, pipkins, and cutlery. The most melancholy of these last mile-stones of life's journey are the isolated ones on the lonely shore near Brenton's Reef—daily passed by gay equestrians in the summer—for they mark the last resting-place of shipwrecked mariners whose bodies were there cast ashore by the tempest to find a nameless grave in a strange land.

One of the most attractive, from endearing associations, of the groups of graves on the island is the burial-ground of St. Mary's—five miles from the town—for that rural temple recalls the benign presence of the lady who built it, and now sleeps in its shadow—a generous and high-toned woman, who for so many years gracefully dispensed the hospitalities of Oaklands amidst the beautiful trees she had planted in her youth. Who that ever enjoyed her greeting can forget the little parlor with its fine paintings, the garden with its odoriferous shrubs, the sweeping branches of the Norway pine, the refreshing copse of oak-trees, the delectable tea-table with its old-fashioned service and seasonable fruits, the often eminent and memorable guests, and, above all, the genial dignity and gracious cheerfulness of the lady of the manor, with her many rural dependents, her liberal charities, her fond but humble love of her Church, the evening prayer, the kindly chat, the fond welcome, and the sweetness and serenity of the scene and the visit? That little cemetery of St. Mary's was newly consecrated to those who there stood on one of the first beau-

tiful Sabbaths of a recent summer, beside the grave of Sarah Gibbs. The little stone church on the hill, the crowd of well-dressed and sad-looking farmers, the troop of children bringing flowers to scatter on the coffin of their benefactress, the vivid and tearful memories that then and there arose in the hearts of the gathered friends, of her uniform goodness, noble nature, and Christian womanhood, the impressive rites of the Church she so loved and labored for, the fresh green of tree and turf, the bright, soft, solemn day, all made up an experience now hallowed to memory, love, and faith. A remarkably appropriate monument has recently been erected over the remains of this venerated lady. It is of the sarcophagus type, of fine granite; a cross is rounded from the apex in a most graceful manner; the monograms *Alpha* and *Omega* are cut in relief upon each end; on one side is the inscription: "SARAH GIBBS. Died June 17th, 1847, *Æt.* 84;" on the other: "Founded this Church, 1847." This chaste and original monument was designed by the accomplished American architect Richard M. Hunt.

The original emigrants from the "Old Country" brought with them the family instincts and traditional habitudes of a mature civilization. Next to "freedom to worship God," and the desire of improving their position and condition in life, or rather as an essential means and method of securing the latter blessing, they attached great value and interest to the possession of land, not merely as an agricultural resource, but a permanent investment—a home, the scene of domestic sympathy and the nucleus of civic and social dignity and enjoyment. To own land was to have a foothold in the world, to cherish local pride and love, to rear and endear children, and found ancestral estates. There was an auspicious conservatism of feeling and practice in those days which, in the view of a rational and loyal nature, reproaches our nomadic habits and the avarice that disintegrates all local attachment and saps all family pride. The ambition of every honest soul, the joy of every loving heart, was then to have a Home, in the true old English meaning of the word—a home to grow up in, to become identified with, to foregather about for bridal, birthday, and religious festival, to return to from adventurous forays into the great world, to associate with venerable age and joyous infancy and thoughtful manhood, to remember with the dreams of youth, with the mutual cares of life, the triumph and the trial, the cozy comfort and wise counsel, with filial, parental, and fraternal love, with the solemn shadow of bereavement, and the glad reunion of prosperity—a home wherein to be born and to die, and within whose familiar, endeared, and transmitted domain to be buried. And therefore it was that almost every large farm had its little cemetery.

Roaming over the fields one comes upon these neglected graves unexpectedly; climbing a fence he peers down into a small inclosure, and among the high grass sees a cluster of old

grave-stones with the familiar names of some old Newport family. Strolling through the grounds of a villa he discovers, in a shady nook, the relics of another family burial-ground; sad and significant tokens of that change of property and proprietorship, of times and habitudes—common indeed to all places and people—the law of human vicissitude, but nowhere so rapid, complete, and profane as in this busy, eager, self-reliant, prosperous, and irreverent land.

There is, however, one striking exception to this abandonment and neglect of the old family cemeteries in Newport. No sojourner can have passed the Ruggles farm and stone house, at the upper extremity of Spring Street, without having noticed with pleasure the neatness and care manifest in the little burying-ground by the road-side. About an acre is inclosed by a handsome stone-wall, with an iron gate in the central front, over which is chiseled, in gilt letters, "*Coggeshall, 1854.*" The interior is kept in perfect order—the turf smooth and green; the stones free from stain, some lateral and others upright, designate the graves of several generations of the family; in the centre is a granite obelisk, the base of which is inscribed, "*To the Memory of John Coggeshall, First President of this Colony: died Nov. 27, 1649, Æt. 57.*" On the upper part is written, "*Erected by a Lineal Descendant, 1855*"—the same who, having thus renewed and embellished the last resting-place of his ancestors, by a testamentary provision has insured its continued order and preservation by the civic authorities of Newport.

The history of religious sects may be recognized in the cemeteries. Thus, in the School-house Yard, on Church Street, two or three upright grave-stones hidden amidst bushes and weeds mark the site of the Moravian church, since converted into an Episcopal chapel—the sect having died out in the place. The comparatively few and fresh stones near where the first little Catholic church stood in High Street evidence the late advent of that denomination, while the larger area devoted to their dead adjacent to the Island Cemetery and the new Stone Church, with its fine organ, stained glass windows, and crowds of worshipers, prove the rapid increase of Irish emigration to Newport. How different the associations, historical and social, awakened by the Oriental letters of the Hebrew graves, the aristocratic emblems of the Episcopal tombs, the plain household appellatives of the Friends' burying-ground, and the thickly-planted crosses inscribed to Patrick, Bridget, or Honora, of the counties of Limerick or Killarney! Amidst the versatile influx of sects the Romanists were the last to obtain a "local habitation and a name" here; and now, as elsewhere in the land, they constitute a prevalent and growing element of the population.

But there is a yet greater sectarian significance in the diversities of sepulchral inscriptions than that involved in name, nativity, and emblem. The Jews compute time from the Creation, and the Christians from the birth of

the Saviour, while the Quakers repudiate the Roman calendar—thus, as it were, defining and emphasizing their views of eternity by their method of signaling time!

There is another distinction in the graves of the island whereof no record appears: many of the oldest are unmarked even by a hillock—a precaution needful in the perilous infancy of the colony to elude the vindictive custom of its savage enemies, who, when cognizant of the place of burial, would desecrate the graves to scalp the corpses of the settlers.

Two of "God's Acres," as the Germans so beautifully designate the burial-places of their dead, in their vicinity to each other and the Baptist and Quaker meeting-houses, indicate with mute eloquence the normal elements of local civilization here initiated. The one is a narrow yard where the grass is thick and tangled, and a few dark, sepulchral stones, mildewed with age, stand like primitive symbols of the people's growth and grace. One is of recent date, having been erected to preserve the fading inscription of its more lowly original by the town of Newport in 1839, on the second centennial anniversary of the settlement:

"To the memory of WILLIAM CODDINGTON, Esq., that illustrious man who first purchased this island from the Narraganset Sachems Canonicus and Martinomo, for and on account of himself and seventeen others, his associates in the purchase and settlement. He presided many years as Chief Magistrate of the Island and Colony of Rhode Island, and died, much respected and lamented, Nov. 1, 1678, aged 78 years."

Chosen in England as "Assistant of the Bay Colony," in 1630, he accompanied the Governor who brought the charter, and was for a considerable period Treasurer of Massachusetts, and a prominent merchant of Boston, and is said to have built the first brick house erected there. The civic intolerance of the authorities in matters of religion, and especially "the proceedings of the Court against Mr. Wheelwright," so alienated his sympathies and aroused his indignation that he sacrificed the prosperous career there opened to him, and even "his improvements at Braintree," and sought a more free and congenial home. He took secret counsel with Sir Henry Vane and Roger Williams.*

* "This island was purchased," says the historian of the State, "through the joint influence of Roger Williams and Sir Henry Vane, in 1637; for grass on the other islands, forty fathoms of white peage, ten coats, and twenty hoes to the resident Indians to vacate, and five fathoms of wampum to the local sachems." Many of the leading settlers were Puritans from Massachusetts. A whipping-post, stocks, and tavern were soon erected. Among the earliest municipal regulations was a game law forbidding deer to be shot for two months, "so that the wolves should come after them and be killed." The first export was lumber. So inimical were the neighboring provinces on account of the "liberty pledge," which included Jews and Pagans, as well as different Christian sects, that the inhabitants were obliged to enter into a treaty with the Dutch of Manhattan for provisions and trade. Spring Street was so called on account of a spring on the west side, near where the State-house now stands. Thames Street was originally a marsh. The State seal was a sheaf of arrows, with the motto *Amor vincit*

Coddington, a fugitive from the same illiberal spirit, and with a small company, fixed his abode on this salubrious isle, determined that here "Christians of every denomination should lead quiet and peaceable lives, without any interference for their speculative opinions." His name is identified with a just and benign administration, and was gratefully bestowed on a neck and cove of the island, whereby they are still familiarly known. He obtained the early charter for the colony; and those who have studied his career and character rank him high among the primitive magistrates of New England and apostles of freedom; one of whom has declared that, "in 1641 Coddington and his associates enacted the first law granting complete religious liberty ever embodied in the legislation of a civilized nation."*

Besides the graves of the first Governor's kindred, and among other ancient memorials, is a square, low pillar of granite, with cornice and pediment, bearing the inscription: "*Here lyeth the body of HENRY BULL, Esq., late Governor of this Colony, who died Jan. 23d, 1693, aged 85.*" And on the other side, "*ANNE CLAYTON, his second wife, and widow of Nicholas Easton; died Jan. 31, 1707*"—names still prevalent and honorably associated with the annals of the infant settlement and its subsequent prosperity.

A short walk, amidst old wooden dwellings and grass-grown streets, from the graves of the ancient Governors, brings us to a level field of turf inclosed by a light iron paling, and intersected by a few widely separated lines of graves—all comparatively of late date. There is a formality and, as it were, reticence in the aspect of this cemetery characteristic of the Friends. Until within a few years it was against the strict rules of the Society to designate the graves of their dead by any visible token or inscription; hence the broad, unmarked area. And it is curiously indicative of the encroachments of the spirit of the age upon this once rigid sect that now head-stones are allowed, but the record confined to the name and date of decease. Those we here behold bear names which are household words in Newport, like TAYLOR and TOWNSEND, BRINLEY and BUFFUM, SLOCUM, ANTHONY, COZZENS, CARR, WILBUR, and WEAVER.

Despite the prohibition as regards mortuary inscriptions, the registers of the Friends are the most complete and authentic record of births, marriages, and deaths. This is a fruit of the methodical and scrupulous habits of the Society. Nor is it the only trait and triumph which the Quaker element imparts to civic life. The order, self-control, and fraternal principles of the Friends had much to do with the pro-

omnia. A settled purpose was displayed by the Puritan colonies, soon after the charter was received by Rhode Island, to set it aside, and active measures were adopted at Plymouth to this end. Portsmouth was the first part of the island settled.—*Arnold's History of Rhode Island.*

* Dr. David King.

gress and peace of old Newport. There is something peculiarly endearing in their memory. Costume, mode of address, and suppression of wrath were characteristics that lent a certain exclusiveness and dignity to their palmy days on this island. Frugal, industrious, unimpassioned, their homes were abodes of peace and plenty; their daughters proverbially beautiful; their hospitality and honor graceful distinctions. Charles Lamb, enamored of their silent worship and marvelous equanimity, and smitten with the gentle Hester, was disenchanted by what he deemed their supreme vanity in believing themselves special recipients of the Holy Spirit. But, in all worldly arrangements, this besetting sin was provided against; and this fact alone must have increased the salient contrast they here afforded of old to the Jews, Episcopalians, French officers, and Baptists. The former's last representatives here made Friends trustees of their temple and cemetery; and many of the latter sect joined them when, as Governors of the colony and social as well as thrifty leaders, they so largely illustrated the resources and the reputation of the island.

Originally driven hither from Boston by the persecution so tenderly delineated by Hawthorne in his story of the "Gentle Bay," for a hundred and thirty years chief magistrates of the settlement, their names are among the earliest on the grave-stones and in the town records, and among the men whose benefactions and examples, and the women whose traditional loveliness endear the past. Quakerism here, it is justly claimed, was rational, free, and brave: Friends from Rhode Island fought in the Revolution, "under strong temptation." It was at Coddington's house that George Fox held his first meeting in Newport.

One of the last saints of this order died not long since, and her long and patient illness was cheered by the sympathy of all sects, who recognized the olden faith, rectitude, and piety in her simple, earnest, and divine resignation. With her the sweet *thee* and *thou* seem to have died away; but the Yearly Meeting still brings its crowd of drab coats and spotless caps, straight waists and broad brims; and on such an occasion, here in the old scene of their supremacy, our noble Quaker poet humorously lamented the falling away of the brethren:

"There are those who take note that our numbers
are small—
New Gibbons who write our decline and our fall;
But the Lord of the seed-field takes care of his
own,
And the world shall yet reap what our sowers have
sown.
"The last of the sect to his fathers may go,
Leaving only his coat for some Barnum to show;
But the truth will outlive him, and broaden with
years,
Till the false dies away, and the wrong disap-
pears."

The memorials of Hebrew sojourn in Newport are unique among the relics of by-gone times in New England, and among the most

striking evidences of the triumphant conservatism of the race. The freshness and order that distinguish the abandoned synagogue and unvisited cemetery reproach the neglected temples and sepulchres of those who trust to local attachment and living kindred to guard their shrines and ashes. With that pervading and indomitable fidelity which has kept the scattered people intact and their faith vital through ages of exile and oppression, the wealthier survivor, by testamentary provision, kept "decently and in order" the graves and place of worship here long since deserted. Touro Street perpetuates the name of the testator, whose thoughtful care for the departed of his race daily suggests itself as a benign evidence of ancient civilization. After the terrible earthquake at Lisbon a company of Jews embarked thence for America; their precise destination was not settled, and the captain of the vessel on board which they were passengers intended to land them on the Virginia coast. Adverse and violent winds led him to seek refuge in Narraganset Bay. Allured by the tolerant laws and spirit of Newport, the Israelite emigrants determined to remain there—thus adding a new element to the curious diversity of faith and nativity which signalized the colony.

Along the crest of the hill on the slope and at the base of which the town is built, a street angle is marked by a plain square granite gateway, over which is cut in bold relief a winged globe, and on the pillars inverted torches, while through the iron railing are seen a few tall hemlocks, a drooping willow, and masses of shrubbery, whence in the soft, damp summer evenings exhale garden fragrance, and through the dense foliage cenotaph, slab, and column glimmer. Neat, silent, and shaded, the little inclosure is passed with a careless glance by crowds of summer sojourners; but a poet's eye gleaned an impressive picture and sacred lesson from the "Jewish Cemetery at Newport."*

How strange it seems! These Hebrews in their graves!

Close by the street of this fair sea-port town,
Silent beside the never silent waves,

At rest in all this moving up and down!

And these sepulchral stones, so old and brown,
That pave with level flags their burial-place,
Seem like the tablets of the Law, thrown down
And broken by Moses at the mountain's base.

The very names recorded here are strange,
Of foreign accent and of different climes;
Alvares and Riveriera interchange
With Abraham and Jacob of old times.

Closed are the portals of their synagogue,
No Psalms of David now the silence break,
No Rabbi reads the ancient Decalogue
In the grand dialect the Prophets spake.

* On the 24th of August, 1694, a ship arrived at Newport, Rhode Island, then the principal port of entry, from one of the West India islands with a number of Jewish families on board of wealth and respectability, who settled there. In a few years a congregation of sixty worshiped in the synagogue, which at length boasted eleven hundred and seventy-five worshipers. Gradually migrating to new States, not a resident Jew is now found in Newport—only their sepulchres remain.

Other Jewish emigrants from the West Indies and elsewhere followed their Portuguese brethren to Newport; and in 1763, when sixty families of wealth had settled there, the synagogue was erected at a little distance from the cemetery farther down Touro Street, a square brick edifice on a little plateau of green turf, substantially fenced in and always freshly painted and kept in perfect order. Over the comparatively new gate is the inscription on a stone entablature: "*Erected 5603, from a Bequest made by Abraham Touro.*"

Both the advent and exodus of the Jews at Newport is characteristic; and so are the few glimpses contemporary annals afford of their enterprise and influence. In 1750 Moses Lopez was excused, at his own request, from all civil duties, "on account of his gratuitous service to government in translating Spanish documents." Jacob Rod Riveriera, one of the fugitives from Lisbon, and his comrades established a spermaceti oil and candle factory on the island now called Fort Wolcott—the first experiment of the kind in the colonies, and long a monopoly here, and no inconsiderable source of wealth. From Newport the enterprise was carried to New Bedford. In the early days of the Lopez establishment his employés went out in boats and captured whales off the coast. Moses Lopez at one time owned twenty-seven square-rigged vessels, and his correspondence indicates large and honorable commercial relations. For many years Moses Seixas, as cashier of the Newport Bank, disbursed specie to the inhabitants; while Dr. Stiles loved to stroll along the Parade discussing some point of Oriental wisdom with the learned Rabbi Isaac Carigal.

The war of the Revolution dispersed the Jewish merchants. Their ships were nearly all taken by the enemy. And in 1799 their temple was deserted, though from time to time a few of the race accidentally there congregated to celebrate a feast, marriage, or funeral; for they reverently brought back their dead, and laid them to rest with the ashes of their forefathers. Moses Hays, a highly esteemed commercial man, removed to Boston, and was followed by Riveriera. Isaac Touro, the priest, and his two sons went to Jamaica, and one was long established in New Orleans. Aaron Lopez went to Providence, intending to return to Newport, but was accidentally drowned in Scott's Pond, near the former place. Cohen and Seixas, sacerdotal rabbis, ministered in the synagogues of Richmond and Charleston; Jacob Rodriguez, one of the spermaceti manufacturers, came back and died here; and the house near the mall, long the hospitable abode of Levy, became the home of the gallant Commodore Perry, and was occupied by his widow until her death. Thus departed from the old town one after another of the once busy and genial Hebrews, whose memorials are so faithfully conserved. It has become a proverb, since the mercenary aptitudes of watering-place life have demoralized the natives, that, although

not an Israelite remains, Jews abound at Newport.

In a neglected nook off one of the little-frequented streets that run from the centre of the town to the hill, unapparent except when sought out, are clustered the few old graves of the Clifton burying-ground, so called from the name of its ancient donor. Rank weeds have overgrown the pathless little inclosure, over which the poor dwellers of the neighborhood spread their washed garments to bleach—the only purpose for which the lonely spot is visited. Yet there, as the weather-stained head-stones declare, is the family tomb and several graves of the Wanton family, which furnished several efficient Governors to the colony, and whose annals well illustrate the process and progress through which fortune and position were, even at that early period, attained in New England by capacity and character. There is a portrait of one of the Governors' wives in the Redwood Library. Originally shipwrights, and able preachers among the Friends, their rectitude and industry, courage and good sense, advanced them in rank and wealth. The cause and manner of their emigration to Newport, as preserved by the family tradition, is characteristic of the times and people.

EDWARD WANTON had successfully carried on his vocation in Scituate, Massachusetts; but his zeal as a Quaker made him obnoxious to the other sects, and his non-compliance with the claim for church-rates to the civic prejudices of the people. Hospitable and kindly, his house was accessible to all, and it is said that, on one occasion, several of the tax-collectors dropped in upon him near the dinner-hour and were invited to partake of that repast; at the end of which they suddenly took possession of all the silver-ware on the table, and declared their intention to retain it until the tithes were paid. This proceeding greatly incensed the two sons of Wanton, and their indignation was intensified by severe personal allusions to their father's faith by the minister of the place, in his Sunday discourse. They determined to seek a more tolerant region, and at the same time punish the author of what they deemed an unjustifiable insult. Accordingly, they visited their clerical adversary late in the evening, and administered to him a drubbing; then rushed away, before an alarm could be given, and mounting swift horses, fled without drawing rein until they reached a tavern about half-way between Scituate and Newport. While recruiting themselves with a hasty meal some of the minister's flock arrived in hot haste in pursuit; whereupon they decamped by the back-door as the enemy came in at the front; mounted the fresh steeds provided for the latter, and soon arrived at what Neale, in his history of the Puritans, calls "the Paradise of New England." Here their craft was in demand, and their creed safe from interference.

Whether fact or fiction, the spirit thus shown was a family trait; for when, in 1706, a sloop

loaded with provisions was taken by a French privateer off Block Island, Captain John Wanton pursued with a volunteer crew, and in two or three hours captured both privateer and prize, and brought them into Newport. This exploit delighted the country and gained naval glory for Rhode Island. Four years previous to this achievement WILLIAM WANTON had been commissioned, while a shipwright of Portsmouth, to cruise with the *Greyhound* in Queen Anne's war, and returned after six months from the Gulf of St. Lawrence "crowned with brilliant success." When Governor Wanton died, in 1733—and again and again the name appears on the roll of colonial magistrates—it is recorded by the historian that "his long career of public service had endeared him to the colonists, and his daring naval exploits won him the regard of his sovereign." And this statement is confirmed by the fact that, when the two brothers were in England, they were received at court, and were presented by the Queen with a silver punch-bowl. Moreover, an addition to the family coat of arms was made, consisting of a game-cock alighting on a hawk.

This union of martial prowess with Friendly tenets was peculiar to the Newport Quakers. One of the earliest of the Wanton name, on this side of the ocean, is believed to have embraced the doctrine of that sect from the interest excited in his mind when witnessing at Boston, in an official capacity, the earnest testimony of Mary Dyer, who, having visited the capital of the Bay State on a mission of the Spirit, was warned, on her reappearance whipped, and, for the third attempt, hanged—a martyrdom which drove many from the spiritual tyranny of that colony to the "soul freedom" initiated by Williams at Aquidneck.

Governor JOSEPH WANTON was a loyalist, and after being suspended for his lukewarm administration of public sentiment as embodied in local law, in 1775, was finally deposed. Even with this blot on the scutcheon of the Wantons, their names stand brightly forth on the colonial record. Their services were eminent and their characters superior; so that the stranger who unexpectedly comes upon their neglected graves marvels at the public indifference thus manifest, and would fain see a Rhode Island Old Mortality piously renew the inscription and revive the record of their worth.

Here, too, is the grave of ISAAC RODMAN—venerable progenitor of a still faithful race, one of whose saintly descendants not long since left an endeared and placid memory; and, evidently to note the advent of the most dreaded pestilence of the olden time, near by, a stone is inscribed with the name of "PARDON TILLINGHAST, who died of Small-Pox at Coasters' Island, 1775."

The memory of a daughter of Roger Williams (and wife of Clarke), whose remains are here buried, carries us back to the tolerant dawn of the isle's prosperity; while a massive

slab of friable slate, whence the inscription is half effaced by time and the elements, marks the last resting-place of ABRAHAM REDWOOD, and reproaches the recipients of his liberal bequest for their forgetfulness of his sepulchre. The graceful Doric structure that crowns the adjacent hill is, however, his best monument. No marble effigy or emblazoned shrine equals in permanence and vital beauty an intellectual legacy, whether the written thought or the means of culture associated with the beneficence of the departed.

When the literary club of old Newport—boasting such erudite members as Callender, Ellery, Honyman, and Samuel Johnson, afterward President of Columbia College, New York, and subsequently reinforced by such brave and genial scholars as Berkeley and Stiles—had long exercised their wits in learned debates and wise social sympathies, the idea of making the association subservient to permanent intellectual culture by the establishment of a library was confirmed by the prompt generosity of the prosperous merchant from Antigua, an efficient promoter of education and charities, whose fortunes had so thriven in the salubrious sea-port. His gift of five hundred pounds for the purchase of books induced the subscription of five thousand by his fellow-citizens for the erection of a building, to which they gratefully gave his name. Insignificant as an enterprise like this would appear now, when the establishment of libraries is a common occurrence, then it was an event of singular interest and influence. Books were a rare luxury; habitual readers few and scattered; aspirants for knowledge ill provided with resources, and obliged to seek them across the sea. Not only the mental training but the fortunes of the town were promoted by the little temple, which then stood in rural solitude on a turf esplanade called the Bowling Green. Men of study and thought were beguiled hither by the privilege. There Dr. Stiles mastered the Hebrew tongue, and luxuriated over a folio copy of Homer; and Channing, a pure and earnest youth, "spent day after day, and sometimes week after week, amidst the dusty volumes without interruption from a single visitor," in the days of decadence and desertion incident to the commercial eclipse after the Revolution.

By a rare coincidence at that period of "wooden lanterns," as Tudor calls the old New England meeting-houses, graceful designs were obtained for the proposed structure from Peter Harrison, assistant architect of Blenheim; and for many years it was the only pure exemplar in the Eastern States. A thing of beauty is not only a joy but an attraction forever; and this library was the nucleus of benefactions—first, from Henry Collins, who gave the land; and, long after, from his kinsman, Solomon Southwick, of Albany, who bestowed a land grant of one hundred and twenty acres. Redwood's grandson, "of Dorset Place, Marylebone," gave the homestead in Newport inherit-

ed from his grandfather. Baron Hottinguer, the Paris banker, who married into the Redwood family, sent a good-will token of a thousand francs; Bishop Berkeley his "Minute Philosopher;" and Catherine Macaulay her "History of England." Ogilvie, Rogers, and Hunter successfully advocated its cause. Judah Touro gave two thousand dollars; and the artist, King, a native of Newport, bequeathed nine; while, as summer residents increased, books flowed in from friends on their travels, author sojourners, and lovers of education and letters; so that the gaps in the goodly array of standard English works made by the ruthless British invaders were gradually filled. The scope of the original charter was expanded by increasing the number of proprietors; and the once exclusive and partially frequented library became a popular reading-room and daily resort, yearly increasing its stores and enlarging its associations of interest and utility, whereof the origin dates from the public spirit of him who sleeps in the Clifton burying-ground. The establishment of the library bears date 1747; and Abraham Redwood, whose portrait, in the costume of that day, so appropriately adorns the walls, died March 6, 1788, at the age of 79. Truly it was written of him that, with an ample fortune, he was blessed with "a liberal spirit, which prompted him to encourage useful learning and relieve the distresses of mankind."*

The most familiar of the old cemeteries of Newport, to the casual visitor, is the little church-yard of old Trinity, through which the congregation pass to their weekly worship. It is full of historical interest, though many of the more ancient memorials must be sought in the records of the parish.† Recently some of the most interesting inscriptions have been renewed on fresh stones. Within the old-fashioned edifice, with its high pews and massive sounding-board, its quaint pulpit and choir, and the organ bearing the inscription, "The Gift of George Berkeley, Bishop of Cloyne," are mural tablets in memory of former pastors and endeared members; and around the portal cluster the graves of those whose names are associated with memorable epochs and events. Here lie buried the Rev. Marmaduke Brown, who died in 1771, and his wife (1767)—the stone erected by their son, who was born here, and died President of Trinity College, Dublin. Learning and piety have characterized the rectors of Trinity, from Honyman, who came as a missionary from London in 1704, to Dehon, afterward Bishop of South Carolina, and from Dr. Wheaton's thirty years' ministrations to the brief service of Dr. Vinton. One acquainted with the recent history of the venerable church, musing over its historical mementoes, can not but rejoice at the prosperous revival of its sacred influences and memories.

* *Newport Herald*, 1788.

† The clock in the steeple was presented to the congregation in 1733 by Jahlcel Brenton, and continued to run without interruption for about 129 years.

A small obelisk designates the burial-place of the family of Dr. Hunter, a Scotch physician who emigrated to America in consequence of the rebellion of 1745. A rebel at home, he became a Tory here; he was a surgeon of the colonial regiments sent to Crown Point in the French war, delivered the earliest course of medical lectures in New England, and died while the English had possession of the town. His son was United States Chargé at Brazil, and a man of historical taste and liberal culture.

In the Hunter mansion—still one of the domestic landmarks of the olden time, though long since left behind by the march of improvement—died the young French Admiral whose grave-stone is adjacent, and bears the name of CAROLUS LUDOVICUS D'ARSAN DE TERNAY, and an elaborate Latin inscription, with the date 1780. He was one of our gallant allies who came hither in the squadron of Count d'Estaing, and cut off in the dawn of his career, it was believed, through chagrin at the escape of the British fleet. Tradition fondly conserves the fame of the young officer, whose funeral was an exceptional pageant in the annals of the town, nine priests and a corps of marines, with foreign and native officers, forming the cortège.*

One of Lafayette's aids, the Chevalier DE FAYELLER, is also buried here. These foreign names remind us of the social influence which the sojourn of the French officers in Newport, during and immediately subsequent to the Revolutionary war, exerted. Domesticated among the people, a new element was contributed both as regards pastime and opinion. The amiable manners of their guests, their ardent devotion to the gentler sex, and their fertility of resource in discourse and recreation, left more enduring traces than the initials and love-to-

* "The blockade, which obliged the French to remain inactive, had embittered many of them against M. de Ternay, as if it was in his power to control circumstances and the elements. 'They reproached him,' says the Duke de Lauzun, 'in the squadron and the army, in the most indecent manner.' He knew and deeply felt it. Whether it was the fatigue of the voyage, weariness of command, the influence of climate, or chagrin at being misunderstood, and finding himself blockaded by a superior force and unable to act, he fell ill on the 7th of December, 1780. His malady at first occasioned no anxiety, but on the 12th it assumed an aggravated and alarming character, and on the 15th he expired, amidst the regrets of all who knew how to appreciate his rare qualities, his brilliant military career, and his bravery. France lost in him one of her best marine commanders. He was buried in Newport, in the cemetery of the Anabaptists, where Louis Philippe, at a later period, caused a monument to be erected, with an inscription which recalls all the services he rendered to France."—*Étude Historique sur la Marine de Louis XVI.* Par Adolphe de Bouclon: Paris, 1866.

Rochambeau writes: "Je trouvai, à mon retour à Newport, le Chevalier de Ternay malade d'une fièvre qui ne donnoit aucune inquiétude. Je continuai mes reconnoissances sur Boston, où je fus à peine arrivé que je recus un courrier du Baron de Viomenil, qui m'apprit la mort du Chev. de Ternay. Ses plus grands ennemis ne pouront jamais lui refuser une grande probité, et qu'il ne fût un très-habile navigateur."—*Mémoires*, i. 260.

kens still described on the little casements of the older dwellings, and inscribed there with the diamonds of their rings. Somewhat of French latitude in matters of speculation, of ingenuity in the *cuisine*, and urbanity of manners lingered after the favored visitors had returned; while, on the other hand, more than one enthusiastic passage in their memoirs and correspondence testifies to the delectable impressions made on the gay Gauls by the Quaker beauties of the island.

Comparatively few as are the head-stones and tablets in this church-yard, to one cognizant of the historical associations connected with the names, vocations, and nativities thereon inscribed, the crowded and weather-stained memorials suggest the prominent events in the local annals of Newport. The foreign consuls and "serchers" of the King's Customs indicate the prosperous commercial epoch not less than the graves of the old merchants like GIBBS, "persevering in Industry, judicious in Enterprise, and faithful in Engagements;" and the origin of the church is associated with ROBERT GARDINER, one of its founders, "whose happiness it was to see it completely finished." The frequent emigration from the West India islands of English colonists is testified by many inscriptions: This, noting that "one of his Majesty's Council at Grenada;" and that, the fact that a "native of Jamaica" is here buried. The British occupation is signalized, not less than the French sojourn, by the grave-stone of a "Lieutenant of H. B. M's Sixty-second regiment of foot," and that of an officer of marines belonging to his Majesty's ship *Rose*; while the names of Brinley and Mason, Goulding and Duncan, Tweedy, Cowley, and Penrose revive the memory of the old colonial society. That of our time is recalled by the familiar name of a summer resident, or the "U. S. N." annexed to that of an American officer.

The tombstone of NATHANIEL KAY, Esq., "a colonial collector," whose name one of the streets of the town still bears, revives the benefactions wherewith his will endowed old Trinity. Kay left an estate on the site of what is known as the Engs house, consisting of several acres of land, *in trust*, to erect and maintain a Grammar School, as an appendage to Trinity Church—whose rector, as master, was to prepare gratuitously a certain number of youths for college. The building yet stands at the corner of School and Mary streets. Brown, the Oxford man, son of Rev. Marmaduke, was taught there. Bequests of this kind were the foundation of England's civilization, in the opinion of her scholars. The Kay property was sold in 1840 for only thirty-three thousand dollars. After the Revolution the edifice, designed as a classical, was used for a Sunday school; the trust fell into neglect, and the now highly valuable land sacrificed by a premature sale. Kay's mortuary slab, on the edge of which is cut the name of Bishop Berkeley's infant daughter, buried near, gently brings back the endeared recollec-

tion of that benign prelate's visit of three years to the colony—in whose subsequent welfare he manifested so lively an interest, and whose local traits and natural charms his letters first made known to Europe, as the single effusion of his muse commemorates the providential destiny of the land he so wisely appreciated. HONYMAN, the faithful clergyman who welcomed him to Newport, and whose farm, still called by his name, near Berkeley's rural abode by the Paradise Rocks, lives in history as the scene of the battle whose bulwarks yet furrow the green meadows of Honyman's Hill, is, with many of his family, also buried in the church-yard of Trinity. His son was for several years king's attorney. A few symbols yet designate the scene as dear to Tory hearts—a gilded crown, heraldic devices, names that are enrolled in English universities or figure in the genealogy of the county nobility—vividly recall the old tenacious love and pride that bound the hearts of certain of the colonists to the mother country, the treasonable sympathy that befriended the English invaders in the war of Independence (in some instances punished by confiscation), scoffed at the departing volunteers as destined to the halter, and maintained a proud exclusiveness among the various sects as aristocratic representatives of the Establishment beyond the sea.

A more individual representative of the proud and free life of the more adventurous colonists may be found in GODFREY MALBONE, whose family monuments here cluster. His dwelling-house on the border, though quite inland, of the bay, a mile or more from the town, was a famous mansion in colonial times; not many years ago the huge box hedge and other vestiges of antique ornament gave no inadequate idea of the old-fashioned garden; on its site some remarkable cedars yet stand. The gilded cornices and rich panel-work of the villa were rare for those days. The stone of which the walls were built was imported from abroad, and is still incorporated in the neat and substantial edifice which occupies its place. Walking once with the late hospitable owner of the domain over the lawn, he thrust aside the path gravel with his foot, and showed me the trap-door which led to a subterranean passage whose outlet was on the shore—evidently a means of secret communication, once used for smuggling and other unlawful purposes. In 1745 two of Malbone's privateers were lost in a gale, and Newport had two hundred widows in consequence. Tradition says that buccaneers were here entertained, and, when heated with wine, enlisted by the sagacious host for a new venture. Large sums were recovered from him in England for his spoliations of the Dutch. A branch of his family were long resident in Virginia, and one of them sought to dissuade Washington from embarking in the cause of Independence. The hospitality of Godfrey Malbone was as proverbial as his recklessness and his prosperity. Among other tales that have come down to us, it is said that

when the "most superb mansion in the colonies" caught on fire, he coolly ordered the dinner-table to be removed to the lawn, and continued the feast in sight of his burning house, whose destruction is ascribed to the fastidious pride of his wife, who objected to any intrusion of plebeian feet into her elegant drawing-rooms—even to extinguish an imminent conflagration. The fact of the fire is recorded in the *Newport Mercury* of June 7, 1766, and attributed to a spark from the kitchen chimney and a windy day.

Godfrey Malbone was one of those adventurous traders who, ostensibly engaged in regular traffic, sometimes combined therewith a lawless enterprise.* Sending his vessels from Newport to the coast of Africa with a cargo of rum, thence to Jamaica with slaves, and home freighted with molasses, with orders to capture a Spanish galleon by the way if circumstances favored.

Conviviality was the normal habit of such men and those days, and their blood was transmitted by other than legitimate currents. Yet a certain social rank and personal consideration coexisted with this license; and the second generation became more civilized, as in this instance, for Godfrey Malbone, the son, an Oxford graduate, built a church in Connecticut; and Edward Malbone, in a collateral branch of the next generation, was one of the most skillful and refined of artists, and gracious and gifted of men.

Few of the hundreds who pass daily up and down Pelham Street are conscious of the fact that they are walking over the former extensive domain of EDWARD PELHAM, Esq., whose last will and testament identifies the "Old Mill" on the summit of the hill as his original property—an unique landmark long the subject of archaeological debate, and attributed to the Northmen, but now acknowledged to be the counterpart of similar structures in some of the English counties. It has, however, as one of the rare local antiquities of our country, furnished a suggestive theme to novelist and poet. Cooper availed himself thereof in the "Red Rover," and Longfellow found inspiration therefrom in "The Skeleton in Armor."

* In the year 1745 there were ten privateers owned in Newport, as follows:

1. Ship *Fame*, of 24 carriage guns and 176 men.
2. Brig *Prince Frederick*, Peter Marshal master, 18 carriage guns (nine-pounders), 30 swivels, and 18 blunderbusses, with a crew of 130 men.
3. One of considerable force commanded by Captain John Dennis.
4. One commanded by Captain Carr, name and force not stated.
5. One commanded by Captain William Dunbar, with a crew of 70 men.
6. One named the *Hector*, Captain Higgins, force not stated.
7. One named the *Cæsar*, Captain Griffith, force not stated.
8. One commanded by Captain Fry, name and force not defined.
9. One commanded by Captain Robert Norris, name and force not stated.
10. One commanded by Captain John Sweet, name and force not stated.

One of the largest dwellings in the street, distinguished by its heavy and high portico and pillars, is built on the site of an old cemetery which was formerly attached to the church where Hopkins preached, and where he was originally buried.

Behind a screen of shrubbery in the yard of this mansion are several sepulchral tablets, marking the graves of Governor Arnold and his family. Some of them bear the coat of arms of the Pelhams. The earliest legible date is that of 1727, when "Governor Benedict Arnold, of Newport," died. Another Governor's, of the same name, is dated 1740. There is also a slab with the name of EDWARD PELHAM, 1774; one inscribed CHACE, 1745; and the latest, JOHN BANNISTER, 1830.

These few memorials of the old Congregational burying-ground identify the family sepulture of an historical race in the annals of the island. The Rhode Island Arnolds are a branch of the traitor's ancestry, but of quite diverse character and fame. The old colonial flag which belonged to Governor Arnold, and was concealed during the war of Independence, and displayed with the establishment of American liberty, is still preserved with the venerable official chair of state he occupied. It is a noteworthy coincidence that the names of original settlers and prominent early citizens of Newport, many of which are now extinct among the living, not only are preserved on the mortuary records of the grave-yard, but are the familiar street nomenclature. Thus we have "Pelham," "Kay," "Bull," "Dixon," and other streets; "Brenton's Reef," "Coddington's Cove," "Bannister's Wharf," etc.

While CHANNING was wrestling not only with the antagonistic forces of his own soul into "victorious clearness," but with the despairing creed of the old Puritan theology, and reading, with exultant tears, the benign psychology of Price and Hutcheson, another of the representative clergy familiar to him and the Newport community was delving in the theological mine to confirm and intensify that creed, with a singleness of purpose and a disinterested devotion which won the respect even of those most revolted by his doctrine. In the yard of the Congregational church in Spring Street, a large freestone edifice, beneath a grand old walnut-tree, and curtained by a vine of Virginia creeper spreading over the adjacent wall, and in autumn magnificent with scarlet and crimson hues, is a solitary grave marked by a broad tablet of massive slate, and thus inscribed:

"In Memory of SAMUEL HOPKINS, Pastor of the First Congregational Church in Newport, who departed this life Dec. 20th, 1813, in the 83d year of his age; whose faithful attention to the duties of his pastoral office and whose valuable writings will recommend his character when this monument, erected by his bereaved flock, shall, with the precious dust it covers, cease to be distinguished."

A more remarkable combination of implacable theory and benevolent disposition never, perhaps, were united as in Hopkins. Born in

Connecticut, and a farmer's boy until the age of fifteen, he graduated at Yale, and studied theology with Jonathan Edwards, whose example, doubtless, inspired him with the desire to vindicate the special dogmas he preached, by a theological treatise and metaphysical arguments. Unattractive as a pulpit orator, poorly supported by a limited parish, but self-reliant, unselfish, and a student by nature and habit, he spent nine years upon his dry and dreary work, and received therefor from its publisher nine hundred dollars—a sum far exceeding his modest expectations. Some of the old people in Newport recall his tall figure clad in a black gown, girded around the loins with a leather belt, and his black silk skull-cap, as he walked to church followed by a faithful negro sexton. One remembers sitting in the gallery of the bare, cold “wooden lantern” and watching the lighters coming up the bay through the high window, while Dr. Hopkins, in a harsh and unmodulated voice, expounded “foreknowledge, will, and fate” to a sparse but attentive group. The vast importance then and there attached to polemics, the prevalence of Theology as a doctrine or science over Religion as an experience and a sentiment, are impressively illustrated by the zeal and patience with which this learned and pious man wrought at his system, which, in the estimation of those who agree with him, had and still has a vital influence upon religious thought and faith, but which the progress of science and the liberal and comprehensive range of modern faith and feeling now renders an abstract theory in comparison to practical Christian living and earnest religious devotion.

At all events, there are few of any sect in our day who would not find the elaborate work of Hopkins hard reading. The character of the man was so upright and kindly that in the popular mind it was separated from that of the writer. His eccentricities remind one of Dominie Sampson, and have furnished a female novelist with hints, which she has, however, greatly exaggerated and modified in “The Minister's Wooing.” Intrepid in behalf of the right, Hopkins was one of the earliest opponents of Slavery and Intemperance. Newport Gardiner, the pious black sexton, who taught the singing-school, and was his *protégé* and convert, he sent to Liberia as a missionary.

On one occasion where he heard “Walking Stewart,” the famous pedestrian, expressing atheistical opinions in the Redwood Library: “You fool,” he exclaimed, “were it not for God you could not move a step from where you stand.” Three-quarters of his time was passed in study, and, but for the thoughtfulness of his parishioners, he would have often gone without his dinner. He corresponded with the abolitionists of Europe, and dedicated his “Dialogues concerning the Slavery of the Africans” to the Continental Congress and signers of the Declaration of Independence. A professed believer in the eternal damnation of the majority of his race, he yet proclaimed the belief—prob-

ably derived from consciousness—in human disinterestedness. Profoundly learned, he was a lover of little children. Tenacious of his personal beliefs, he was indifferent to personal comfort. Artless in manner and feeling, affectionate in intercourse, patriotic, indefatigable in research, a dauntless and pioneer social reformer, he was, at the same time, the stern expositor of the old theology. “Without his works,” writes his biographer, “no one can understand the religious history of New England.” Too severe for the moderate Calvinists of Massachusetts, where he was first settled, he could not assimilate with the fashionable and convivial society of Newport; unprepossessing in aspect, but kindly in manner, full of knowledge, abstracted, indigent, candid, cruel in speculation yet tender in life, his image and career illustrate a phase and form of the clerical character now all but obsolete, yet original and significant to the student of the past.

Newport, as the resort and the resource of extremists, early became a nucleus for controversy and creeds as well as for enterprise. “The Aquidneck settlements,” says Arnold, “for many years increased more rapidly than those on the main land. The accessions appear to have been, for the most part, from a superior class in point of education and social standing, which, for more than a century, secured a controlling influence in the colony.” But, in addition to a better order of culture, the religious element from the first permeated the social life of Newport. “The Aquidneck settlers,” says Callender, “were Puritans of the highest form.” Yet nowhere did Puritanism become so soon and essentially modified by tolerant agencies. Winthrop complains “they gathered a church in a very disordered way; for they took some excommunicated persons, and others who were members of churches and not dismissed. Mrs. Hutcheson and those of Aquidnay broach new heresies every day.”

One of the sons of Newport, at the Bi-Centennial celebration of the Settlement, exults in this immunity from ecclesiastical rule and persecution as a blessed distinction of the Newport over the Boston colonists. “They scored no Baptists' backs with stripes,” he boasts; “no Quakers languished in their jails; no witch dangled on their gibbets.” The Establishment found as much to complain of in this religious tolerance as the Puritans. “Neither Epiphanius's nor Sir Richard Blackmore's catalogues,” wrote M'Sparran, the Episcopal missionary, “contains more heterodox and different opinions than are to be found in *this corner*.”

Hence the winds of doctrine were freely set loose in Newport society of the olden time; and Hopkins is the last vigorous and valiant champion of the old Calvinistic theology, unmodified by the subtle and pervasive influences of modern thought and popular education, facilities of human intercourse and discoveries of recent science. With these agencies theology, as such, has waned in social estimation. We read its

formulas on the old grave-stones; but the youth of this generation can not experience such a discipline as did Channing in his boyhood here. "When I was a mere child," he writes, "I was quite a theologian, though I hated to hear my elders chop logic according to the fashion of that controversial time."

Cozy and convivial by contrast are the domestic scenes of this dogmatic warfare. The low ceilings, wainscot panels, the French plate mirrors with heavy frames, the upright hall clock with "London" and perhaps a half-risen moon on the dial, the straight-backed mahogany chairs, old English prints on the walls, the small window-panes often set in cedar-wood, the green painted floors, the snug and sunny window-seats, the broad hall and easy staircase, the high mantles and vast chimney, quaint side-board, portraits by Stuart or miniatures by Malbone, fresh geraniums, ancient sampler—a mourning piece "in memory of Hamilton"—cut glass decanters, and old silver, are insignia of the old households which vividly contrast with verandas, lawns, croquet grounds, French chairs, marble centre-tables, ottomans, photograph albums, and conservatory flowers of the modern villas.

The largest and most representative of the domains of the dead, in Newport, is what is called the Island Cemetery—a broad and nearly level area extending along the bay near the outskirts of the older part of the town. Roaming through this silent and sequestered field of graves on a cool summer morning or calm autumn noon, bright and blue glimpses of the bay, flecked here and there with a passing sail, win the eye as it is lifted from a monumental inscription; while, on the other side, weather-stained houses cluster, and in the open country beyond, the brown dome-like hayricks and outstretching arms of the old wind-mill towers give a kind of rural picturesqueness to the scene, finely contrasted with the mossy gray rocks of the islands. Vivid tints of evergreens, the orange-breasted robins hopping over the green hillocks, the soft touch of the breeze, the white fleecy clouds sailing through the illimitable and stainless ether, the solitude and the sanctity of the place, combine to deepen curiosity into awe and soften speculation into tenderness, as one wanders and reads and muses, with the freshest greetings of Nature blending thus with the venerable memorials of mortality.

Standing on this elevated plateau, in the midst of the dust of generations, and gazing over town, fields, islands, and harbor—all clearly revealed in every detail of form and hue by the transparency of the atmosphere and the tempered sunshine—what a mysterious feeling is awakened by the thought that Nature's every aspect, feature, and phenomena are identical with those once familiar and dear to the dead around, centuries ago, as to us to-day; while all the human traits and tokens have undergone so vast and absolute a change; for some

of those whose ashes here repose knew the old town when bale-fires blazed on Sachuest and Windmill hills, in King Philip's war; when Captain Cook's ship, that had circumnavigated the world, was broken up in the harbor; when the British sloop of war *Liberty* was destroyed there—the first active protest against that tyranny which the war of Independence overthrew; when discomfited Burgoyne sailed thence with his troops; or when the Indian's light canoe alone stirred the blue waters, succeeded by the emigrant ship, the buccaneer, the whaler, the merchantman, and, at last, by the American man-of-war and fleets of steamers and yachts—marking the progress of civilization, trade, science, and social luxury, until villa superseded gable-roofed domicile, smooth lawns rough farm-yards, and peripatetic, avaricious land-brokers the old-school merchants; and the aristocratic nucleus of colonial wealth, enterprise, and hospitality became first a decaying sea-port, and then a gay summer sojourn!
